The bisectors of two exterior angles, as BE and CE in fig. 3, meet at a point on the bisector of the interior angle at the other vertex, this point being the centre of another circle touching the three sides. Four circles in all are found to touch the sides.

The lines joining the vertices to the middle points L,M,N, of the opposite sides meet in a point, G called the *centroid.* The perpendiculars AP, BQ and CR meet in a point O, called the *orthocentre.*

There is the remarkable theorem that the points L,M,N,P,Q,R and the middle points U,V,W of AO, BO, CO lie on a circle (the *nine-point circle*), and the still more striking result (Feuerbach's Theorem) that this circle touches the four circles touching the sides of the triangle.

BIBLIOGRAPHY.—For advanced reading there are J. Casey, *A Sequel to Euclid* (1889), and C. V. Durell, *Plane Geometry for Advanced Students* (1909–10); N. Altshiller-Court, *College Geometry* (1925); R. A. Johnson, *Modern Geometry* (1929). (C. F. Gu).

TRIANGLE, in music, an instrument of percussion of indefinite musical pitch, consisting of a rod of steel bent into the form of a triangle. Suspended by a loop, it is played by means of a short steel rod. The tone of the triangle is clear and ringing, but it should have no definite pitch.

TRIANON, TREATY OF. The treaty of peace between the Allied and Associated Powers and Hungary was signed at the Trianon on June 4, 1920. Owing to the outbreak of Béla Kun's revolution in Hungary, the delegates of that nation were not summoned to the Peace Conference till Nov. 1919. Previous to that date, however, on June 13, 1919 the Supreme Council had decided upon the new frontiers of Rumania and Czechoslovakia and had published them. The Hungarian Government received the treaty in Jan. 1920 and on June 4 it was signed at Trianon.

Though the separation of Hungary from Austria and its complete independence were recognized, the details of the Hungarian Treaty were otherwise very closely akin to those of the Austrian, the most important difference being that, while the Treaty of St. Germain was signed with the republic of Austria, that of Trianon was signed with Hungary, or with "the national Government of Hungary," a phrase permitting her to be regarded as a Government where the monarchy is temporarily in suspense. Though Charles never abdicated the kingship of Hungary and there is no provision in the treaty for his deposition or for that of any Habsburg, he was formally deposed by a law passed by the Hungarian Assembly (after his attempted *Putsch*, Oct 1921) at the insistence of the Allies. (*See* HABSBURG.) On her admission to the League of Nations in 1922 Hungary submitted to the League a document pledging herself not to restore the Habsburgs without the consent of the Allies, and confirming the undertaking to the Conference of Ambassadors of Nov. 10, 1921.

Territorial Clauses.—The territorial clauses of the Hungarian Treaty reduced her to a population of 7,500,000 (1910 census), of whom approximately 6,250,000 are Hungarians (Magyars); 500,000 are Germans, 500,000 are Jews, 230,000 are Slavs and Slovaks and 50,000 are Rumanians. Fiume was ceded to the principal Allies by article 53 and, after being erected into a free city, was eventually annexed by Italy (1924). Hungary lost to other nations over 3,000,000 Magyars, of whom 1,500,000 go to Rumania, nearly 1,000,000 to Czechoslovakia and 500,000 to Yugoslavia. Much of the Magyar population lost (as *e.g.*, the Székler area) consists of Magyar islands isolated amid a sea of Slavs or Rumanians. The Pécs area, with its valuable coal mines, was returned and a line drawn in this area so as to give Hungary a defensible frontier. For economic reasons the three Magyar towns of Satul-Mare (Szatmár) Oradea-Mare (Nagyvárad) and Arad and the surrounding Magyar zone were given to Rumania.

Part V.—The military, naval and air clauses were almost exactly similar to those of the Austrian Treaty except that Hungary was allowed an army of 35,000 instead of Austria's 30,000. Part VI., *Prisoners of War and Graves*, and Part VII., *Penalties*, were the same as in the Austrian Treaty. (*See* St. GERMAIN, TREATY OF.)

Part VIII.—Reparation.—This section is verbally almost identical with the Austrian section, and both are a close imitation of the German. For various reasons it was not possible to fix the exact amount of reparation. But Hungary was forced to surrender all rights to her merchant ships on "the ton for ton, class for class basis," and her reparations in kind were to be fixed in three months by the Reparation Commission, which was to deliver cattle to Italy, to Rumania, and to the Serb-Croat-Slovene kingdom (Annex iv. to Part viii.).

Financial and Economic Clauses.—Articles 180–199 are mainly concerned with liquidating the Austro-Hungarian National Bank, thus separating the last link with Austria. Part X., the economic clauses, calls for no special remark, nor does Part XI., Aerial Navigation. The economic clauses are the same as the Aus-

trian, the latter like that of both German and Austrian Treaties Part XII, ports, waterways and railways, is mainly concerned with the regulation of the Danube, for which a statute was eventually drawn up. As in the case of the Austrian Treaty (Article 311), the Hungarian in Article 294 provides for the free access of Hungary to the Adriatic, though practically nothing has been done to secure it. Part XIII, labour, is the same in all treaties and Part XIV., miscellaneous provisions, calls for no remark.

TRIASSIC SYSTEM or **TRIAS,** geological terms used to designate the lowest major division of the Mesozoic era—given by F. von Alberti (1834) owing to the division of the system into a threefold series in Germany, in contradistinction to the twofold division (Dyas) of the underlying Permian.

Like the Permian (*q.v.*) the Trias is represented by two phases of sedimentation, the one continental as in Germany, the other marine—the latter being the normal aspect.

Where the marine facies is developed the division between the Permian and Triassic systems, or in other words between the Palaeozoic and Mesozoic eras, can best be drawn by means of the faunas. Where the continental facies ocurs fossil evidence is scanty, and the general similarity of the deposits, together with their rapid changes in lithological type, makes it difficult to define the boundaries of the two systems. In Britain they are so closely knit that the term New Red Sandstone was formerly suggested by Goodchild for the combined Permo-Trias; and there is a tendency to revert to that grouping.

Records of the continental phase reside in breccias, conglomerates, red and mottled sandstones, marls and clays, with beds of dolomite, limestone and coal, and layers of gypsum, anhydrite or rock-salt. The coarser deposits consist of frost- or sun-riven scree material accumulated almost *in situ*, or as wide-spreading torrential fans Conglomerates afford evidence of transportation by water, whilst the oblique bedding of certain sandstones, coupled with the perfect rounding of many of the grains and the *dreikanter* form of some of the enclosed pebbles, point to the action of wind. Some of the sands may represent dunes, but the majority were deposited with layers of mud in sheets of water which were shallow and subject to frequent desiccation. Of this we have evidence in reptilian footprints, fossil rain-pits, ripple-marks, sun-cracks and precipitated salts Fresh influxes of water are shown by pellets of sun-dried mud and salt-pseudomorphs included in the sandstones.

GERMANY

The Trias occupies a larger area than any other formation in Germany and is classified as follows:—

Keuper	Rhaetic	Sandstones and clays with *Avicula contorta* Bone bed
	Gypsekeuper	Steinmergel and Stubensandstein Gypsekeuper and Schlifsandstein
	Kohlenkeuper	Grenzdolomite Lettenkohlensandstein Dolomitic limestones and marls
Muschelkalk	Haupt-Muschelkalk	Trigonodus beds Nodusus beds Prochiten Kalk
	Anhydrite group, dolomite, and marls and limestones with rock-salt, gypsum and anhydrite	
	Wellenkalk, with Schaumkalk zones near top	
Bunter	Upper or Röth: variegated clays or marls with plants	
	Middle or Hauptsandstein (and Vosgessandstein), with subordinate conglomerates	
	Lower: Sandstones (some clayey) and shales, with oolite (Rogenstein)	

In North and Central Germany the Zechstein clays are succeeded conformably by clayey Bunter beds. In other districts there is unconformity, with overlap of higher members of the Bunter.

The Roth contains rock-salt and bivalve-bearing beds of limestone and dolomite (Rhizocorallum Dolomite)

The Muschelkalk—mainly calcareous—is the only division with a considerable fauna, which is poor, however, in comparison with that of the marine deposits of the Alps. In extent it is inferior to the Bunter, its westward limits stopping short of central France, although it occurs near Toulon and Montpellier In Alsace-Lorraine the Lower Muschelkalk takes on a sandy facies (Muschelsandstein) as does the Middle division in part of Luxembourg The Upper Muschelkalk is the richest in fossils, being characterized by *Ceratites nodosus, C. semipartitus* and *C. enodis*.

The Keuper (*Marnes irisées* of France) comprises red and variegated clays, pale sandstones, limestones, dolomites and impure coals Estuarine conditions in the Kohlenkeuper are shown by *Myophoria goldfussi* and *Estheria minuta* as well as relics of fishes (*Acrodus, Ceratodus,* etc), and terrestrial conditions by Labyrinthodonts and Saurians (*Mastodonsaurus,* etc). The Gypsekeuper contains rock-salt in Lorraine Stubensandstein and Schlifsandstein occur in south Germany The former yields saurian remains (*Aëtosaurus ferratus* and *Belodon kapffi*), the latter plants (*Equisetum arenaceum,* etc)

Rhaetic beds, typical of the Rhaetic Alps, mark the return into western Europe, by a wide-spread marine transgression, of the seas that characterized the subsequent Mesozoic era, and form a passage between Keuper and Lias (Infra-Lias of France), although the molluscan fauna and the flora suggest a Triassic age. In Germany the Rhaetic consists mainly of pale sandstones and grey shales The fauna—with *Avicula* (*Pteria*) *contorta, Protocardium rhaeticum,* and other forms—is not rich, but highly important, because of its great extent. Remarkable features are the bone-beds, a few inches thick, which occur at several horizons, crowded with teeth, bones, scales and coprolites of fishes and reptiles. Here are found *Ichthyosaurus* and *Plesiosaurus,* anticipating their maximum development; while remains of *Belodon* and *Mystriosuchus* serve as a link with Triassic Stegocephalian reptiles. Teeth of *Microlestes antiquus,* the oldest known mammal, occurred near Stuttgart

Trias of German type, including Muschelkalk, extends at intervals beyond the Pyrenees to the south of Spain. Triassic rocks occur in Heligoland and there is an outlier of Upper Triassic in the south of Sweden which includes coal-bearing Keuper and marine Rhaetic Trias with Muschelkalk extends from Silesia into Poland. In north-west Russia the beds belong chiefly to the Tartaric stage—in part only Triassic.

BRITAIN AND IRELAND

As in Germany (excluding the Rhaetic) the Trias of Great Britain is of continental facies Its outcrop in England and Wales is narrow in the south-west, but expands in the Midlands and bifurcates at the southern end of the Pennines, one extension projecting into Durham, the other into Cumberland and Westmorland, whence it extends into parts of south Scotland. Other occurrences are found in the Western Isles and on the opposed shores of Moray firth. Denudation has removed the Trias from all but north-eastern Ireland

No representative of the Muschelkalk has been found.

The deposits usually follow the Permian (where developed) with conformity, although minor discordances occur here and there. Tending to fill up the Permian basins, they spread, in many cases, further afield and rest upon still older rocks, their higher members often overlapping their lower divisions. The typical sequence is as follows, and is compared with that occurring west of the Pennines:

The relationship of Trias to Permian is difficult to determine. As stated elsewhere (*see* PERMIAN) it has been claimed that part, if not all, of the Bunter of Nottinghamshire is equivalent to a great part of the Permian Zechstein of Durham. This awaits more general acceptance or denial: what may be conceded

	S. Lancashire and the Midlands	Maximum thickness	Furness (Lancs.), Westmorland, Cumberland and Isle of Man	Maximum thickness
	Rhaetic beds (marine)		? Rhaetic beds	
Keuper	Marls with gypsum	Over 2,000	(Stanwix Shales (saliferous)	About 1,000
Keuper	Waterstones	200		
Keuper	Lower Sandstones and, 01,	200	? Waterstones	
Keuper	Basement conglomerates and breccias	400		
Bunter	Upper Mottled Sandstone	500		
Bunter	Pebble Beds	700	Kirklinton Sandstone / St. Bees Sandstone	Over 3,000
Bunter	Lower Mottled Sandstone (? Permian).	650	St. Bees Shales, with gypsum (Permian-Trias)	Brockrams 200

is that probably the Lower Mottled Sandstone of South Notts may represent some of the highest Permian strata occurring farther north The Lower Mottled Sandstone of Wirral (Cheshire) is possibly also of Permian age, whilst there are grounds for the belief that the St. Bees Shales (correlated with the Durham Permian Marls) are transition beds and may represent, in part at least, Lower Mottled Sandstone of other areas.

The Mottled Sandstones consist typically of alternations of soft red and variegated sandstones, generally without pebbles. In Nottinghamshire and south Yorkshire the Upper group is absent The Pebble Beds are harder red and brown sandstones, with, in places, strong false-bedding, aeolian sand grains, dreikanter, etc. In some localities they contain abundant quartzose pebbles, probably derived from local sources now concealed. In the Midlands they form undulating country typically expressed in Cannock Chase and Sherwood Forest and furnish a first-class water-bearing horizon In Devon is the "Budleigh Salterton Pebble-bed," with pebbles derived both from Normandy and from a northern local source. These Pebble beds were accumulated chiefly in shallow water, but some of the coarser deposits may represent dune sands. The absence of pebbles, and the finer grade of material, makes it difficult to distinguish the Bunter of north Yorkshire and Durham from the Keuper. The St. Bees and Kirklinton Sandstones also are almost devoid of pebbles. Breccias (Brockrams) were formed continuously to the west of the Cumberland hills both before and during the deposition of the Zechstein, St. Bees Shales, and part of the St. Bees Sandstone —emphasizing the intimacy of these deposits

Keuper deposits extend into most of the above described regions, in places slightly unconformable to the Bunter, beyond the limits of which they frequently extend, and may have local breccias at the base. Of these the best known is the "Dolomitic Conglomerate" (Bristol district), a shore-line breccia of the inland Keuper sea which gradually buried a well-dissected landscape of older rocks. It is largely composed of Carboniferous Limestone set in a dolomitic matrix, but local patches contain Old Red Sandstone. It has yielded reptiles (*Thecodontosaurus, Palaeosaurus*). The Keuper of Charnwood Forest, Leicestershire, conceals mountains of which the tops only are now visible.

Typical Keuper Marl consists of rhythmic alternations of chocolate red marls, red shales and pale dolomitic sandstones (skerries). In the Midlands is the Arden Sandstone with *Estheria, Hybodus, Acrodus*, Labyrinthodonts and plants. The Waterstones are variegated shales and marls with soft red sandstone; whilst the Lower Keuper Sandstones are false-bedded freestones—not always present. In Worcestershire the latter have yielded scorpions, and, near Birkenhead, Cheshire, footprints of reptiles.

At the top of the Keuper is a belt of "tea-green marls" which, in the south-western counties, pass up into fossiliferous grey shales (Sully Beds). These shales have been classed with the Rhaetic.

Gypsum and alabaster appear at several horizons, the most important occurring in the Midlands at 60–70 and 160 ft. respectively below the Rhaetic. They are extensively mined (Newark, Chellaston, etc). In Cheshire and Worcestershire great beds of salt set in at lower horizons, and this mineral appears also at Puriton in Somerset. The Stanwix Shales of the Carlisle district carry gypsum, whilst those of the Isle of Man, Walney Island and Pressall, Lancashire, have deposits of rock-salt.

In Britain the Rhaetic (or Penarth) Beds usually consist of White Lias (well developed in the south-west) on dark *Avicula (Pteria) contorta* Shales. Certain smooth-textured White Lias limestones yield a landscape marble (Cotham): at the top is the sun-bed or "jew-stone." At the base of the *Avicula* Shales is a bone-bed with fossils similar to those of Germany, including the mammal *Microlestes*, which is also found in the Sully Beds.

In South Scotland the Annan Sandstone is correlated with the St. Bees Sandstone, whilst in Arran the Bennan Shales and Auchenshaw Sandstones and Shales are considered to be Bunter, and the overlying marls and shales (Levencorroch and Torr nan Uain) Keuper. At the top are grey-green marls succeeded by Rhaetic Beds. Triassic rocks occur also in Skye, Raasay and Mull—breccias, conglomerates, marls and cornstones, with gypsum in the upper beds—and at Morven and Ardnamurchan (Argyllshire) and Gruinard bay (Ross-shire) There is a complete passage into the Lias here. The Trias of Elginshire south of Moray Firth contains sandstones with a reptilian fauna. That of the lower beds is allied to the Karroo forms, whilst the upper beds (Lossiemouth) contain *Hyperodapedon gordoni, Ornithosuchus woodwardi*, etc., which are undeniably Triassic.

In Ireland existing Triassic deposits have been largely protected by Tertiary basalts. Both Bunter and Keuper are represented (Lagan valley) very similar to that of the Cumberland coast: at Carrickfergus and Kilroot, near Belfast, rock salt is found in the Marls. Rhaetic beds with *Avicula contorta*, etc., link the Keuper with the Lias (Larne; Collenglen, near Belfast).

THE ALPS

The marine Trias is frequently referred to as "Alpine," "Mediterranean" or "Pelagic." In Europe and eastwards through Asia It forms part of the deposits of the great Mediterranean sea, or "Tethys," situated north of Gondwanaland. (*See* article PERMIAN.) The facies is distributed widely in southern Europe, particularly in the eastern Alps, Apennines, Sicily, Balearic Islands, Spain, Balkan Peninsula and part of the Carpathians.

In the Alps, where the rocks form a broad zone on both sides, sandy rocks are subordinate to limestones, dolomites and marls, whilst the fauna makes that of the German Muschelkalk appear poor by comparison. The following divisions are recognized, chiefly in the eastern Alps:—

Keuper	Rhaetic	Dachsteinkalk and Kössener beds	with	*Megalodon triqueter* and *Avicula contoria*.
Keuper	Noric	Dachsteinkalk and Hauptdolomit (or)	„	*Megalodon triqueter, Worthenia solitaria*, etc.
Keuper	Noric	Hallstatterkalk	„	*Pinacoceras metternichi, Cladiscites, Halorites*, etc.
Keuper	Karnic	Raibl beds	„	*Tropites subbullatus* and *Trachyceras aonides*.
Keuper	Ladinic	St Cassian beds	„	*Trachyceras aon*
Keuper	Ladinic	Wengen beds	„	*Daonella lommeli*
Keuper	Ladinic	Buchenstein beds	„	*Protrachyceras reitzi, Ceratites, Arcestes*, etc.
Muschelkalk	Anisic	Alpine Muschelkalk (with Mendoladolomite, etc)	„	*Ceratites trinodosus, Athyris trigonella, Spiriferina fragilis, Pinacoceras, Gervillia socialis*, etc.
Bunter	Scythic	Werfen beds	„	*Myophoria costata, Avicula clarai, Ceratites cassianus, Tirolites*, etc.

The Werfen beds (Salzburg) are conformable to the underlying Permian and consist of red sandy shales and beds of gypsum and rock-salt, with impure limestone in the upper part. The

Alpine Muschelkalk is highly fossiliferous and differs in many respects from that of Germany, being of truly marine character Typically the Ladinic consists of limestones, dolomites, tuffs and lavas, though there is also a calcareous and a dolomitic facies. In the St. Cassian beds the fossils are dwarfed.

The Raibl beds indicate a regression of the sea, evidenced by plant-bearing sandstones (Lunz), and marls with gypsum. The Rhaetic consists generally of marly limestones forming a thin but continuous sheet.

The small masses of limestone of Bogdoberg (Kirghiz Steppes, south Russia) overlying red sandstones and marls are portions of Muschelkalk of Alpine type on the equivalents of the Bunter.

Marine Trias occurs also in Asia Minor, many parts of Asia as far east as China, the Indo-Pacific islands, Japan, Spitsbergen, New Zealand, New Guinea, Timor, Peru, Colombia, Mexico and western North America. With the exception of the last these areas lie north of or on the margins of Gondwanaland. Certain of these occurrences are dealt with below.

ASIA

In India the finest development of marine Trias occurs in the Himalayas. In Spiti (Lilang), Garhwal and Kumaon and on the north-west extension of the same geo-synclinal axis in Kashmir the rocks comprise three subdivisions corresponding to the Alpine Bunter, Muschelkalk and Keuper (with Rhaetic). The Bunter, which rests conformably on the Permian Productus Shales, consists of 50 ft. of shales and limestones with an ammonite fauna (*Otoceras, Ophiceras, Meekoceras*). The Muschelkalk is chiefly concretionary limestones, 400 ft. thick, with *Ceratites, Siberites*, etc., and, at the top a Daonella (lamellibranch) limestone. The Keuper comprises 2,000 ft. of shale and marl beneath thick limestones and dolomites with a cephalopodan fauna. The lower division corresponds to the Karnic and Noric stages, whilst the limestones probably represent the Rhaetic.

In the north-west Himalayas (Sirban Mountains, Hazara) Trias rests unconformably on Devonian shales and limestones (Infra-Trias). Felsitic lavas are succeeded by limestones from 500–1,200 ft. thick, with characteristic fossils.

Trias of reduced thickness and comprising only the Lower and part of the Middle division occurs in the western part of the Salt Range where it caps the Permian Productus Limestone. The Lower division consists of thin limestones with an extraordinary abundance of *Ceratites*. The Middle, or Muschelkalk, contains many cephalopods.

In north Baluchistan shales and slates with a few limestones represent the Rhaetic stage. It contains *Monotis* and cephalopods (*Didymites, Halosites*) and rests unconformably on Carboniferous Fusulina limestone. A similar development occurs in the Arakan Yoma of Burma whilst in the Northern Shan States the Noping beds, with *Avicula contorta*, suggest a Rhaetic age.

Peninsular India was at this time joined up to Australia and Antarctica, Madagascar, South Africa, and South America, and formed part of the continent named Gondwanaland. (*See* article PERMIAN.) The Trias is represented by the Middle Gondwana Series which is divided into three groups:—Panchet, Kamthi and Maleri (or Denwa) corresponding approximately to the divisions of the German Trias. In the type area (Satpura Range) the rocks consist of massive sandstones, conglomerates, grits and shales devoid of coal seams and are unconformable to the Permian Damuda Series. Vegetation, hitherto profuse, became scanty or failed.

The Panchet group (1,500 ft.) is of restricted development and is overlapped by the Kamthi division (3,000–8,000 ft.), whilst the Maleri is of variable thickness and occurs but locally. In the Panchet group vertebrate remains include fishes, Labyrinthodonts (*Stegocephala*), Amphibia (*Glyptognathus*, etc.) and reptiles (*Dicynodon*, etc.), whilst the Kamthi group contains similar forms as well as a flora with *Glossopteris, Gangamopteris, Phyllotheca*, etc. The clayey Maleri group has remains of fishes (*Ceratodus*), Labyrinthodonts (*Gondwanosaurus*) and reptiles (*Hyperodapedon*, etc.). Biologically the fauna agrees closely with the English Trias.

AFRICA

In South Africa the Triassic deposits are continental and form the greater part of the Karroo Beds covering much of what is now the Union. They occur also in south-west Africa, along the borders of the Kalahari, over parts of Rhodesia, Portuguese Africa and regions further north.

In the Cape Province, the Permian Ecca Beds are followed by the Beaufort and Stormberg Series, the former divided into Lower, Middle and Upper Beds, the latter into Molteno Beds, Red Beds, Cave Sandstone and Drakenberg Volcanics. In central Transvaal the Beaufort Series is absent and the Stormberg Series is represented by Bushveld Marls, Sandstone and Amygdaloids. The Lower Beaufort Beds, with their reptilian remains (*Pariasaurus, Dicynodonts*, etc.), are consideerd by du Toit to be Upper Permian and the Volcanics to cover the period from Rhaetic to Lias; the Middle Beaufort are Lower Triassic and the remainder (Upper Beaufort–Cave Sandstone) Upper Triassic.

The Beaufort beds of the Cape are divided by lithological characters agreeing with fossil vertebrate zones. The Middle group consists of mudstones and sandstones, whilst the Upper group has more of the bright coloured mudstones. They contain reptiles (*Erythrosuchus, Cynognathus*, etc.) and Amphibians (*Trematosaurus*, etc). Plants include *Schisoneura*, and, at the top, *Thinnfeldia, Ginkgoites*, etc. Rhodesian representatives are the Upper Wankie Sandstone (with fresh-water beds, *Glossopteris*, and reptiles) and the Madumabisa Shales.

The Stormberg Series occurs in Basutoland and neighbouring parts of the Union. The Molteno Beds, which disappear northwards, contain silicified trunks of Dadoxylon and plant remains (*Thinnfeldia, Ginkgoites, Schizoneura*, etc.). The Red Beds thin northwards, becoming the Bushveld Marls, represented on Rhodesia by Escarpment Grits. Next comes the massive Cave Sandstone, with false-bedding primarily of aeolian origin. Its counterparts are Bushveld Sandstone (Central Transvaal) and the Forest Sandstone (Rhodesia).

The Drakenberg Volcanics are basaltic lavas with, in places, agglomerates and ashes or beds of sandstone near the base At Mont-aux-Sources, Natal, they are 4,500 ft. thick. North of Pretoria (Springbok Flats) they become amygdaloidal basalts, whilst in the Wankie-Zambezi area (Rhodesia) the Batoka Basalts form the picturesque scenery about Victoria Falls. Intrusive into the Karroo system is a phenomenal number of sills and dikes of dolerite.

Beaufort beds have been detected on the west coast of Madagascar overlying coal-bearing beds with *Glossopteris*.

AUSTRALIA

In New South Wales Triassic strata of the Sydney-Blue Mountain area follow the Permian nearly conformably. The district was above sea and extended farther east than at present, the deposits being formed in shallow fresh water lakes. The Hawkesbury Series is divided into Narrabeen, Hawkesbury Sandstone and Wianamatta Stages in upward sequence The Narrowbeen beds thin westwards from the coast, becoming also coarser. *Estheria coghlani* is common at one horizon; *Schizoneura* is abundant; *Glossopteris* is rare.

Hawkesbury Sandstones are strikingly represented near Port Jackson and in the canyons and ravines of the Blue Mountains. They contain plants (*Thinnfeldia, Phyllotheca*), fish (*Ceratodus* and shark) and Labyrinthodonts (*Mastodonsaurus, Platyceps*). The Wianamatta beds are largely clay shales with ferns (*Thinnfeldia, Aethiopteris australis*), Ginkgoales, Cycadaceae, Equisetaceae, fish (*Palaeoniscus*, etc.), a few molluscs and crustacea.

Of slightly later date (Trias-Jura) are the Clarence Series of New South Wales and the Artesian Series of the New England Tableland. They seem to be equivalent to the Ipswich and Burrum Beds of Queensland and the Gippsland and Otway Beds of Victoria. In Tasmania the Knockfofty Series and the overlying Ida Bay Series, near Hobart, possibly represent the Hawkesbury Series.

NEW ZEALAND

Trias forms the lower division of the Hokonui System in New Zealand and consists of sandstones, shales and conglomerates of

estuarine and fluviatile origin (with plant-remains from a continental region to the north-west in the present Tasman sea) intercalated with marine beds containing characteristic species of the Alpine Trias of south Europe and India. The Noric, Karnic and part of the Ladinic stages are represented.

AMERICA

In South America the sea lay westward of Gondwanaland, marine Trias occurring west of the Andes. In Uruguay, Paraguay and south Brazil continental deposits are remarkably like those of parts of South Africa. The Rio do Rasto Beds comprise variegated mudstones and sandstones and pass up through aeolian sandstones into the Botucatu Sandstone, which is covered by basaltic lavas that occupy an enormous region in Paraná, Santa Catherina, Paraguay, etc. *Scaphonyx*, from the Rio do Rasto Beds is allied to *Erythrosuchus* of the Upper Beaufort Beds. The upper groups resemble the Cave Sandstone and Drakenberg Volcanics.

A tillite in eastern Argentina passes up into unfossiliferous beds rather like those of the Falklands, where the thick Lafonian (Permo-Triassic) System covers over one half of the eastern island. Towards the top the facies resembles that of the Beaufort Beds.

The Appalachian revolution in North America resulted in the uplift of the eastern and southern part of the continent with the concurrent formation of continental deposits. Open sea lay on the Pacific border and extended inland to the site of the Rocky Mountains, where the chief deposits were of fresh-water type.

In the Eastern States disconnected and faulted troughs filled mainly with Middle and Upper Triassic deposits extend from Nova Scotia through Connecticut and New Jersey (Newark System) to South Carolina. Deposits are usually red and everywhere unconformable to underlying formations. With them are associated sheets (*e.g.* "palisades" of the Hudson, New Jersey) and dikes of diabase, and basaltic lavas. The Newark System, 20,000 ft thick, is divided into the Stockton-Norriston, Lockatong and Brunswick Groups. The sediments and their scanty fossils (land-plants, fishes and tracks of reptiles) point to deposition under semi-arid conditions.

The finest development of marine Trias is in the Sierras, California, Nevada, Idaho and Oregon, where the deposits are usually calcareous and about 4,000 ft. thick. From Vancouver to Queen Charlotte Islands they increase to 13,000 ft., more than ninetenths being volcanic.

The early Triassic sea stretched eastwards possibly to central Wyoming. In middle times it withdrew westward, whilst later it spread from Alaska to northern Mexico. This sea had connection with Asia by the northern Pacific, and with "Tethys" by way of the northern shores of Gondwanaland. The deposits can be divided in harmony with the Alpine Trias, California possessing the best known development of the Upper Trias. The Noric is represented by two zones, in the lower of which coral reefs (*Astraeidae*) extend from California into Alaska. Almost 25% of the fauna is identical with that of the Mediterranean area.

Throughout the Rocky Mountain region between Canada and western Texas, and in northern New Mexico and Arizona, continental Upper Triassic gypsiferous shales and sandstones overlie older eroded formations often of a similar character. They contain bone conglomerates with amphibia (*Stegocephalia*), crocodilian types (*Mystrosuchus*) and dinosaurs. Silicified wood, as in the petrified forest of Arizona (Flagstaff), is common. Plants include cycads, ferns and conifers. Gingkos were represented by *Baiera* (also in Upper Karroo). The *Glossopteris* flora, so characteristic of Gondwanaland, is absent. (B. Sm.)

TRIBALLI, in ancient geography, a Thracian people whose earliest home was near the junction of the Angrus and Brongus (the east and west Morava), and included towards the south "the Triballian plain" (Herodotus iv. 49), which corresponds to the plain of Kossovo in Turkey. In 424 B.C they were attacked by Sitalces, king of the Odrysae, who was defeated and lost his life in the engagement. On the other hand they were overcome by the Autariatae, an Illyrian tribe; the date of this event is uncertain (Strabo vii. 317). In 376 B.C. a large band of Triballi crossed Mt. Haemus, and were preparing to besiege Abdera when Chabrias appeared off the coast with the Athenian fleet and compelled them to retire. In 339 B.C. when Philip II. of Macedon was returning from his expedition against the Scythians, the Triballi refused to allow him to pass the Haemus unless they received a share of the booty. Hostilities took place, in which Philip was defeated (Justin ix 3), but the Triballi appear to have been subsequently subdued by him. After the death of Philip, Alexander the Great in 334 crossed the Haemus and drove the Triballi to the junction of the Lyginus with the Danube. Their king Syrmus took refuge in Peuce, an island in the Danube, whither Alexander was unable to follow him. The punishment, however, inflicted by him upon the Getae (*q.v.*) induced the Triballi to sue for peace. In spite, however, of misfortunes at the hands of the Gauls, they continued (135–84 B.C.) to cause trouble to the Roman governors of Macedonia. Under Tiberius mention is made of Triballia in Moesia, and the Emperor Maximin (A.D. 235–237) had been commander of a squadron of Triballi.

TRIBE, A tribe is defined by Dr. Rivers as "a social group of a simple kind, the members of which speak a common dialect, have a single government, and act together for such common purposes as warfare." In this definition it is necessary to understand by single government a political unity of a very simple kind, which may not imply the existence of any obvious mechanism of government, such as an hereditary monarchy or an elected council, with which we are familiar amongst civilized peoples.

Although it is usual to regard primitive peoples as always organized in definite tribes (Carveth Read, *The Origin of Man and his Superstitions*, 1925), the tribe as a definite group is often entirely lacking. In the case of pastoral peoples, definite groups with a political function, transcending families and clans, are likely to occur, but a settled population needs no such unification, unless the special demands of industry or the need for united action in warfare necessitate central control or the delimitation of groups. Thus it is often difficult in Melanesia to find any division of the people into distinct political units One district usually shades into another politically, unless there is established enmity between the groups; and the names of groups, which might be thought to be tribal names, are found to be of indefinite extension. In these cases the social and political organization is comprised in the family, clan and local relations; the political solidarity of any given district depends on the sum-total of family, clan, local and personal relationships in that district (W. E. Armstrong, *Rossel Island*, 1928). There is tribal organization but there are no distinct tribes In other places, however, in which social organization is of the same general kind, but in which conditions, such as isolation on a small island, or historical circumstances, have unified a district, on account of economic or other conditions, we can speak of definite tribes In so far as the political unity of such a district becomes dependent on locality, rather than on kinship and other relationships between the members of the district, the tribe passes into a simple form of state. For Indian tribes, *see* North America, *Ethnology*.

Bibliography.—The tribe is discussed in most general works on Sociology; for example, in Giddings, *Principles of Sociology* (New York, 1896); in R. H. Lowie, *Primitive Society* (1921) under "Government," and in W. H. R. Rivers, *Social Organisation* (1924).

TRIBONIAN, the famous jurist and minister of Justinian, was born in Pamphylia in the latter part of the 5th century. Adopting the profession of an advocate, he came to Constantinople and practised in the prefectural courts there, reaching such eminence as to attract the notice of the emperor Justinian, who appointed him in 528 one of the ten commissioners directed to prepare the first *Codex* of imperial constitutions. When the commission of sixteen eminent lawyers was created in 530 to compile a collection of extracts from the writings of the great jurists of the earlier empire, Tribonian was made president. He had already been raised to the office of quaestor, which at that time was a sort of ministry of law and justice, something like that of the English lord chancellor of the later middle ages. During the progress of the work of the commission there broke out in Constantinople (532) the Nika insurrection. Tribonian

was accused of having prostituted his office for the purposes of gain, and the mob searched for him to put him to death (Procop *Pers.* i. 24–26). Justinian, yielding for the moment, removed him from office, and appointed a certain Basilides in his place After the suppression of the insurrection the work of codification was resumed. A little earlier than the publication of the *Digest*, or *Pandects*, there had been published another but much smaller law-book, the *Institutes*, prepared under Justinian's orders by Tribonian, with Theophilus and Dorotheus, professors of law (see Preface to *Institutes*). About the same time the emperor placed Tribonian at the head of a fourth commission, consisting of himself as chief and four others—Dorotheus, professor at Beyrut, and three practising advocates, who were directed to revise and re-edit the first *Codex* of imperial constitutions The new *Codex* was published in November 534 With it Tribonian's work of codification was completed. But he remained Justinian's chief legal minister He was reinstated as quaestor some time after 534 (Procop. *Pers.* i. 25; *Anecd.* 20) and seems to have held the office as long as he lived He was evidently the prime mover in the various changes effected in the law by the novels of Justinian (*Novellae constitutiones*). The date of his death has been variously assigned to 545, 546 and 547 *See* JUSTINIAN I.

The usual criticisms on Tribonian may be found in the *Anti-Tribonianus* (1567) of Francis Hotman, and an answer to them in J. P. von Ludewig, *Vita Justiniani M. atque Theodorae Augustorum, nec non Triboniani* (1731).

TRIBUNE [Lat. *tribunus*, connected with *tribus*, tribe], a name assigned to officers of different descriptions in ancient Rome

Military Tribunes.—The original tribunes were the commanders of the contingents of cavalry and infantry supplied to the Roman army by the early tribes: the Tities, the Ramnes, and the Luceres In the historical period, the infantry in each legion was commanded by six tribunes, and the number six is to be traced to the doubling of the three tribes by the incorporation of the new elements which received the names of *Tities secundi*, *Ramnes secundi*, *Luceres secundi* The *tribuni celerum*, or commanders of the horsemen, no longer existed in the later times of the republic, having died out with the decay of the genuine Roman cavalry. So long as the monarchy lasted these tribunes were nominated by the king as commander-in-chief; and the nomination passed over to his successors, the consuls From 362 B.C. six tribunes were annually nominated by popular vote, in 311 B.C the number was raised to 16, and in 207 B.C. to 24, at which figure it remained. The tribunes thus elected sufficed for four legions and ranked as magistrates of the Roman people, designated *tribuni militum a populo*, while those who owed their office to the consuls bore the title of *tribuni rufuli* The rights of the assembly passed to the emperors, and "the military tribunes of Augustus" were still contrasted with those nominated in the camp by the actual commanders. (For *Tribuni aerarii*, *see* AERARII) There was another important class of tribunes that owed its existence to the army. In the long struggle between the patrician and plebeian sections of the population, the first distinctions to which the plebeians forced their way were military, and the contest for admission to the consulate was, in part, a contest for admission to the supreme command of the national forces. In 445 B.C., power was given to the senate of determining from year to year whether consuls or military tribunes with consular authority (*tribuni militares consulari potestate*) should be appointed But no election was valid without the express sanction of the senate

Tribunes of the Plebs.—The most important tribunes were the tribunes of the *plebs* (*tribuni plebis*). These were the outcome of the struggle between the patrician and the plebeian orders. When in 494 B.C. the plebeian legionaries met on the Sacred Mount, it was determined that the plebeians should by themselves annually appoint executive officers, two tribunes (the very name commemorated the military nature of the revolt) to confront the two consuls, and two helpers, called *aediles*, to balance the *quaestors*, and that the persons of the tribunes and aediles should be regarded as inviolable. The ancient traditions concerning the revolution are extremely confused and contradictory. It must have ended in something which was deemed by both the contending bodies to be a binding compact, although the lapse of time has blotted out its terms. This is necessary to explain the "sacrosanct" character always attached to the tribunate. There must have been a formal acceptance by the patricians of the plebeian conditions, probably the oath which was first sworn by the insurgents was afterwards taken by the whole community, and the "sacrosanctity" of the plebeian officials became a part of the constitution There must also have been some constitutional definition of the powers of the tribunes These rested at first on an extension of the power of veto which the republic had introduced. Just as one consul could invalidate an order of a consul, or of any officer inferior to him. There was, no doubt, a vague understanding that only orders which sinned against the just and established practice of the constitution should be annulled, and then only in cases affecting definite individuals. This was technically called *auxilium*. The cases which arose most commonly concerned the administration of justice and the levying of troops

Development of the Tribunate.—Although the revolution of 494 B.C. gave the tribunes a foothold in the constitution, it left them with no very definite resources against breaches of compact by the patricians The traditional history of the tribunate from 494 to 451 B.C is obscure; but there is a thread running through it which may well be truth We hear of attacks by patricians on the newly won privileges, even of the assassination of a tribune, and of attempts on the part of the plebeians to bring patrician offenders to justice. The plebeians attempted to set up a criminal jurisdiction for their own assembly parallel to that practised by the older centuriate assembly. Furthermore, the *plebs* attempted something like legislation; it passed resolutions which it hoped to force the patrician body to accept as valid As to details, only a few are worth notice. In the first place, the number of tribunes was raised to ten; how we do not know, but apparently some constitutional recognition of the increase was obtained Then an alteration is made in the mode of election. As to the original mode, the authorities are hopelessly at variance. It was in accordance with the Roman spirit of order that the tribunes, in summoning their assemblies, should ask the plebeians to organize their supporters in bands The *curia* was certainly a territorial district, and the tribunes may have originally used it as the basis of their organization If tribunes were elected by plebeians massed *curiatim*, such a meeting would easily be mistaken in later times for the *comitia curiata*. A change was introduced in 471 B.C by the Publilian Law of Volero, which directed that the tribunes should be chosen in an assembly organized on the basis of the Servian tribe, instead of the *curia*. This assembly was the germ of the *comitia tributa*. The question by what authority the Law of Volero was sanctioned is difficult to answer. Possibly the law was a mere resolution of the plebeians with which the patricians did not interfere, because they did not consider that the mode of election was any concern of theirs. Whatever view may be taken of the movement which led to the decemvirate, an important element in it was the agitation carried on by the tribunes for the reduction of the law of Rome to a written code. Until they obtained this, it was impossible for them to protect those who appealed against harsh treatment by the consuls in their capacity of judges.

During the decemvirate the tribunate was in abeyance. It was called into life again by the revolution of 449 B.C., which gave the tribunes a considerably stronger position Their personal privileges and those of the aediles were renewed The road was opened up to legislation by the tribunes through an assembly summoned by them on the tribe-basis (*concilium plebis*), but subject to the control of the senate. The growth of the influence of this assembly over legislation belongs rather to the history of the *comitia* (*q.v.*) than to that of the tribunate. After the Hortensian Law of 287 B.C., down to the end of the republic, the legislation of Rome was mainly in the hands of the tribunes. The details of the history of the tribunate in its second period, from 449 to 367 B.C., are hardly less obscure than those which belong to the earlier time. There was, however, on the whole, undoubtedly an advance in dignity and importance. Gradually a right was acquired of watching and

interfering with the proceedings of the senate, and even with legislation. Whether the absolute right of veto had been achieved before 367 B.C. may well be doubted. But the original *auxilium*, or right of protecting individuals, was, during this period, undergoing a very remarkable expansion. From forbidding a single act of a magistrate in relation to a single person, the tribunes advanced to forbidding by anticipation all acts of a certain class, whoever the persons affected by these restrictions might prove to be. It therefore became useless for the senate or the *comitia* to pass ordinances if a tribune was ready to forbid the magistrates to carry them out. Ultimately, the mere announcement of such intention by a tribune was sufficient to cause the obnoxious project to drop; that is, the tribunes acquired a right to stop all business alike in the deliberative assembly, the senate, and in the legislative assemblies, or *comitia* The technical name for this right of veto is *intercessio*. The two main objects of the tribunes were the opening of the consulate to plebeians, and the regulation of the state domain in the interests of the whole community Both were attained by the Licinio-Sextian laws of 367 B.C.

Then a considerable change came over the tribunate. From being an opposition weapon it became an important wheel in the regular machine of state. As the senate became more and more plebeian, the old friction between senate and tribunes disappeared. It was found that the tribunate served to fill some gaps in the constitution, and its power was placed by common consent on a solid constitutional basis. From 367 to 134 B.C. (when Tiberius Gracchus became tribune) the tribunate was for the most part a mere organ of senatorial government.

Qualifications and Powers.—Even after the difference between patrician and plebeian birth had ceased to be of much consequence, the plebeian character was a necessity for the tribune. When the patricians P. Sulpicius Rufus and, later, P Clodius (the antagonist of Cicero) desired to enter on a demagogic course, they were compelled to divest themselves of their patrician quality by a peculiar legal process. The other necessary qualifications were such as attached to the other Roman magistracies: complete citizenship, absence of certain conditions regarded as disgraceful, and fulfilment of military duties. The election took place in a purely plebeian assembly, ranged by tribes, under the presidency of a tribune selected by lot. The tribune was bound by law to see a complete set of ten tribunes appointed. Technically, the tribunes were reckoned, not as magistrates of the Roman people, but as magistrates of the Roman *plebs;* they therefore had no special robe of office, no lictors, but only messengers (*viatores*), no official chair, like the curule seat, but only benches (*subsellia*). Their right to summon the *plebs* together, whether for the purpose of listening to a speech or for passing ordinances, was rendered absolute by the "laws under sacred sanction" (*leges sacratae*), which had been incorporated with the constitution on the abolition of the decemvirate. The right to summon the senate and to lay business before it was acquired soon after 367 B.C., but was seldom exercised, as the tribunes had abundant means of securing what they wanted by pressure applied to the ordinary presidents, the consuls or the praetor. When an *interregnum* came about and there were no "magistrates of the Roman people," the plebeian tribunes became the presidents of the senate and conductors of state business. At the end of the republic there were *interregna* of several months' duration, when the tribunes held a position of more than usual importance.

The Right of Veto.—The real kernel of the tribune's power consisted in his *intercessio*, or right of invalidating ordinances, whether framed by the senate or proposed by a magistrate to the *comitia*, or issued by a magistrate in pursuance of his office. From 367 B.C. down to the time of the Gracchi the power of veto in public matters was, on the whole, used in the interests of the governing families to check opposition arising in their own ranks. A recalcitrant consul was most readily brought to obedience by an exercise of tribunician power. The tribunes found a field for constant activity in watching the administration of justice, and in rendering assistance to those who had received harsh treatment from the magistrates. The tribunes were, in fact, primarily legal functionaries, and constituted in a way a court of appeal. It was to this end that they were forbidden to pass a whole night away from the city, except during the Latin festival on the Alban Mount, and that they were expected to keep their doors open to suppliants by night as well as by day. They held court by day in the Forum and frequently made elaborate legal inquiries into cases where their help was sought We hear of this not infrequently in Cicero's speeches, and in other writings which deal with legal matters According to the general principle of the constitution, magistrates could forbid the acts of magistrates equal to or inferior to themselves. For this purpose, the tribunes were deemed superior to all other officers. If a tribune exercised his veto no other tribune could annul it, for the veto could not be itself vetoed, but it was possible for another tribune to protect a definite individual from the consequences of disobedience. The number of the tribunes made it always possible that one might baulk the action of another, except at times when popular feeling was strongly roused The veto was not, however, absolute in all directions. In some it was limited by statute; thus, the law passed by Gaius Gracchus about the consular provinces did not permit a tribune to veto the annual decree of the senate concerning them. When there was a dictator at the head of the state, the veto was of no avail against him. One of the important political functions of the tribunes was to conduct prosecutions of state offenders, particularly ex-magistrates. These prosecutions began with a sentence pronounced by the tribune upon the culprit; whereupon, exercising the right given him by the XII. Tables, the culprit appealed. If the tribune sought to inflict punishment on the culprit's person, the appeal was to the assembly of the centuries; if he wished for a fine, the appeal was to the assembly of the tribes.

The Late Republic and Empire.—It is commonly stated that a great change passed over the tribunate at the time of the Gracchi, and that from their day to the end of the republic it was used as an instrument for setting on foot political agitation and for inducing revolutionary changes This view is an inversion of the facts. The tribunate did not create the agitation and the revolutions, but these found vent through the tribunate, which gave to the democratic leaders the hope that acknowledged evils might be cured by constitutional means, and in the desperate struggle to realize it the best democratic tribunes strained the powers of their office to their ruin For the bad tribunes did not hesitate to use for bad ends the powers which had been strained in the attempt to secure what was good But the tribunate only fared like all other parts of the republican constitution in its last period. The consuls and the senate were at least as guilty as the tribunes. After a severe restriction of its powers by Sulla and a restoration by Pompeius, which gave a twenty years' respite, the essential force of the tribunate was merged in the imperial constitution, of which indeed it became the principal constituent on the civil side The ten tribunes remained, with very restricted functions. The emperors did not become tribunes, but took up into their privileges the essence of the office, the "tribunician authority" (*tribunicia potestas*). This distinction between the principle of the office and the actual tenure of the office was a creation of the late republic Pompeius, for example, when he went to the east, was not made proconsul of all the eastern provinces, but he exercised in them a "proconsular authority," which was the germ of the imperial authority on its military side. Similarly the emperor, as civil governor, without being tribune, exercised powers of like quality with the powers of the tribune, though of superior force. By virtue of his tribunitian authority he acquired a veto on legislation, became the supreme court of appeal for the empire, and to his person was attached the ancient sacrosanctity. Augustus showed the highest statesmanship in founding his power upon a metamorphosed tribunate rather than upon a metamorphosed dictatorship, upon democratic rather than aristocratic traditions.

Rienzi.—The name "tribune" was once again illuminated by a passing glory when assumed by Cola di Rienzi (*q v.*) The movement which he headed was in many respects extremely like the early movements of the plebeians against the patricians, and his scheme for uniting Italy in one free republic was strangely parallel with the greatest dream of the Gracchi.

TRICAMERON, BATTLE OF (A.D. 535). This battle is one of the landmarks in the emperor Justinian's (*see* JUSTINIAN I) series of campaigns by which Italy, Africa and southern Spain were temporarily recovered. In itself it was the decisive victory by which the army of the eastern Roman empire overthrew the Vandal power in Africa, and in military history it has special significance as an outstanding illustration of the predominant power of cavalry during the 1,000 years which succeeded the overthrow of the Roman (infantry) legions at Adrianople (*q.v.*). Belisarius' infantry was a day's march in rear of his cavalry when he encountered the Vandal army, under King Gelimer, assembled in order of battle. So great was Belisarius' faith in the combined fire power and mobility of his horse-archers that he accepted the risk of battle without waiting for his infantry. He took up a position behind a small stream, hoping that he might have the opportunity to launch his own stroke while the Vandals were entangled in the crossing, and to this end sent out small detachments to tease them into an advance. Finding that the enemy was too wary, or too doubtful of success, to be drawn across the river, Belisarius took a more audacious risk—advancing his own centre through the stream as a bait. Thereupon the Vandals, still holding their centre back, moved their wings forward to envelop and assail the Roman centre during the passage. While the leading lines were locked in this close-quarter struggle, and the rear lines waiting to engage, Belisarius launched his own wings at them. The charge, having the advantage of impetus, shattered the Vandal wings. The Roman centre, if hard pressed for a brief time, had admirably fulfilled its role of fixing the enemy. The rout of the Vandal wings uncovered their centre, which was then surrounded and almost annihilated by the Romans

TRICERATOPS, the best-known member of the horned dinosaur group (Ceratopsia) of the Upper Cretaceous This was a four-footed dinosaur about 20 ft long. Its head bore a pair of long brow horns and a smaller horn over the nose; a large bony frill protected the neck. (*See* DINOSAURIA.) (A. S. RR.)

TRICHINOPOLY, a city of India, in Madras state. The city is on the right bank of the river Cauvery, 250 mi. by rail S.W. from Madras. Pop. (1941) 159,566. The fort which forms the nucleus of the city measures about 1 mi. by ½ mi.; its defenses have been removed. Within it rises the isolated Rock of Trichinopoly, 273 ft. above the city, which is ascended by a covered stone staircase, entered by a carved gateway, and profusely ornamented. Trichinopoly is an important trading centre and railway junction Its industries are goldsmiths' work and modelling in pith, silk weaving, cigar and soap making Trichinopoly and its neighbourhood were the scene of much hard fighting between the English and the French during the Carnatic wars between 1749 and 1761.

TRICHINOSIS or TRICHINIASIS, a disease in man and other animals caused by infection with the parasite *Trichinella spiralis*. The parasite was named by Sir Richard Owen on the basis of encysted trichinae discovered in human muscle by Sir James Paget (*q.v.*) in 1835. The larvae were first found in the muscle tissue of swine by Joseph Leidy (1823–91) in 1846. The complete life cycle was elucidated in 1859 by Rudolf Leuckart (1822–98) and Rudolf Virchow (1821–1902), who, working independently, found the adult worms in the intestinal tract. The clinical character of the acute disease caused by the invasion of the parasite was demonstrated by Friedrich von Zenker (1825–98) in 1860. Following Zenker's discovery, severe outbreaks of the disease were recognized in Prussia and other parts of Germany.

The disease is acquired by eating uncooked or inadequately cooked flesh containing the encysted third-stage larvae, which are released from their cysts by the action of the gastric juice and migrate from the stomach to the small intestine. Here the sexes develop to maturity, usually within 72 hr, and mate promptly. Birth of living young begins as early as the fourth day after infection. Larval production may continue for a period of six weeks or longer. The young worms find their way to the lymph spaces and are carried to the heart and thence to the lungs, from whence they reach the general circulation Once in the voluntary muscles, the larvae come to rest within the substance of the muscle fibre. Here they undergo rapid growth Within 10 to 14 days after penetration, they reach a length of approximately ¼ in. and become spirally coiled. A cyst is gradually formed around the larva. In about eight to ten months, the cyst wall begins to calcify, in time the larvae die and are absorbed or become calcified

The parasite is widespread in many hosts Cats, dogs and rats are frequently infected In addition to infection from pork, clinical cases in man have resulted from the consumption of smoked dog meat, the flesh of the nutria and bear meat Infection in swine varies with methods of husbandry. In the United States, where the feeding of raw garbage is a common practice, approximately 6% of swine maintained on such food are infected. Undoubtedly, infection is carried through pork scraps in the garbage The incidence in grain-fed hogs is less than 1% In European countries for which data are available, only a fraction of 1% of swine are parasitized; many of these countries require the microscopic inspection of pork. Infection in hogs is equally low in England, which requires the cooking of garbage fed to swine.

Types of pork products customarily eaten without cooking are potent sources of infection unless processed for the destruction of the parasites. These so-called "summer sausages" include frankfurters, salami, mettwurst, cervelat, etc.

Trichinosis has occurred in many parts of the world Outbreaks have been reported from most European countries In England, trichinosis was a rare disease until 1941 when several hundred cases occurred. A number of small outbreaks were also reported from Wales at that time Between 1937 and 1951 inclusive, an average of about 400 clinical cases a year were reported in the United States, where the widespread distribution of the parasite was indicated by its recovery from 16.1% of 5,313 individuals succumbing to conditions other than trichinosis. These cases came to autopsy in 189 hospitals in 37 states and the District of Columbia between 1936 and 1942. The majority of these individuals had only light infections and probably never suffered ill health therefrom Surveys of similar scope were not carried out in England and other European countries. However, data indicate that the incidence of the parasite at mid-20th century was only a small fraction of that in the United States. Similar findings obtained in Canada and Australia

Trichinosis is characterized by an extremely varied chain of symptoms In severe infections, nausea, vomiting, diarrhoea and abdominal pain may appear within 24 to 48 hr In the absence of such symptoms, signs of illness usually begin about 5 to 14 days after the ingestion of infected pork; the incubation period may be as long as three weeks Early symptoms are weakness, fatigue, headache and fever; some patients have pharyngitis or laryngitis with cough Later the fever rises and there are chills and sweats Swelling around the eyes and face is a frequent symptom. A rash may be present on the trunk and upper extremities. When the larvae begin to reach the muscles, pronounced muscle pain and stiffness of the joints are experienced Symptoms of heart disease may be present and pneumonia is not an unusual complication. The larvae may invade the spinal cord and brain and give rise to symptoms simulating meningitis, encephalitis or poliomyelitis The acute phase of the disease lasts from two to three days in mild cases and up to three to four weeks in more severely infected individuals If complications ensue, the course may be prolonged After recovery, the muscle pain gradually disappears and in most cases there are no residual symptoms. The mortality rate of clinically recognized cases is fairly low; in the United States between 1930 and 1938, for example, it was approximately 6%

Diagnosis of sporadic cases is difficult because the symptoms simulate closely those of many other conditions A leucocytosis is usually associated with the disease, while an eosinophilia, or increase in the acid-staining white cells of the blood, is usually but not always present A biopsy of muscle tissue may disclose the larvae Skin tests and serological tests are of value but, like the biopsy, are usually not positive until after the larvae have reached the muscles Unfortunately, there is no drug of any specific value and treatment is mainly symptomatic.

Prevention lies in the thorough cooking of pork. As a general rule all pork should be cooked until the pink colour has entirely disappeared Microscopic inspection is carried out in some countries. In the United States, federal meat-inspection regulations require processing for the destruction of trichinae of all pork used in products customarily eaten without cooking by the consumer. However, only about 70% of the pork slaughtered comes under federal inspection. Protection extends only to such products since there is no inspection or treatment of fresh pork or other types of pork products. (*See* PARASITIC DISEASES.)

(W. H. WT.)

TRICHOPTERA, the term used in zoological classification for the order of insects commonly known as caddis flies. They are for the most part somberly coloured insects, many of them small, few exceeding an inch in length from head to wing tips Caddis flies are weakly flying insects of mothlike appearance, closely related to Lepidoptera Excepting a few species they are not often seen on the wing unless disturbed; they may, however, be conspicuous locally and at certain times because they are attracted to lights. They are found in the vicinity of ponds and streams in which the early stages are passed.

Caddis flies have four membranous, hair-covered wings with a predominantly longitudinal venation; the forewings are very hairy, the hindwings more transparent, usually broader and with

a plicated posterior lobe. The mouth parts are weakly formed; in some cases at least they are capable of ingesting liquid food, the mandibles are vestigial, the palpi alone are normally developed. The antennae are held porrect and are in some extreme cases three times the length of the wings.

Caddis flies have complete metamorphosis The eggs are laid in or near water, in masses, with a gelatinous covering. The larvae are aquatic, living in cases made of fragments of foreign materials such as leaves, twigs, gravel, sand and even the shells of small molluscs, held together by a salivary secretion. These cases are often characteristic of the species or genus; they may be made as soon as the larva hatches and enlarged as necessary, but in certain groups the cases are constructed shortly before pupation.

The larva has a well-developed head, biting mouth parts and rather long legs The last body segment has a pair of strong appendages whose terminal hooks serve to hold the case and to prevent eviction. Undulatory movements of the body keep water streaming through the case and respiration takes place through gills or through the body wall. The larvae are omnivorous, feeding on plant materials and on the smaller aquatic animals including insects.

At the approach of pupation the case is fastened down, the forward end is closed off with a sieve comparable to that of the rear end, and in one family a cocoon is spun within the pupal case The pupa has very well-developed mandibles which serve the single purpose of opening the case for emergence. The pupal skin is cast at the surface of the water or nearby

FROM H. W. ROSS, "THE TRICHOPTERA OF ILLINOIS" (STATE NATURAL HISTORY SURVEY OF ILLINOIS)

RHYACOPHILA FENESTRA (ABOUT FIVE TIMES NATURAL SIZE)

Caddis flies are found on all continents and more have been reported from boreal than from tropical areas. More than 3,500 species are described and they are commonly divided into from 13 to 17 families; more than 800 species are reported from North America and about 185 from the British Isles.

The larvae of caddis flies are of considerable importance as fish food.

TRICONODONTA, a group of small, extinct, carnivorous mammals of the Jurassic Age, characterized by the condition of their molar teeth, which typically bore three cusps arranged in a line, the long axis fore-and-aft. They left no descendants *See* MAMMALIA; MULTITUBERCULATA; PALAEONTOLOGY.

TRIDYMITE, a rare mineral consisting of silicon oxide or silica, SiO_2, but differing from quartz in crystalline form. The crystals are small, thin hexagonal plates or scales, which are usually twinned together in groups of three; hence the name, from Greek, τρίδυμος, triplet. The apparent hexagonal plates are themselves pseudo-symmetric twins of optically biaxial material, but at a temperature of 117° C. these optical anomalies disappear and the plates are then truly hexagonal (β-tridymite). The specific gravity is 2.28 (that of quartz being 2.65). Unlike quartz, tridymite is soluble in a boiling solution of sodium carbonate; it occurs in the cavities of acid volcanic rocks (rhyolite, trachyte and andesite), but in most instances the crystals are replaced by a fine granular aggregate of quartz. At a temperature of 870° quartz passes over into β-tridymite with a considerable increase in volume; and this change has an important bearing on siliceous refractory materials used for furnace linings and silica bricks. At a still higher temperature (1,470°) tridymite itself passes over into another modification of silica known as cristobalite. (*See* SILICA.)

TRIER (French TRÈVES), an ancient city of Germany, formerly capital of an archbishopric and electorate of the empire, and now seat of a Roman Catholic bishop and chief town of a governmental department in the Prussian province of the Rhine Pop. (1939) 88,595 It is on the Moselle, about 6 mi. from the Luxembourg frontier and 69 mi. S W of Coblenz by rail on the Coblenz-Metz and Cologne-Saarbrucken lines. Some of the piers and buttresses of the bridge over the Moselle may date from about 28 B.C. The well-preserved amphitheatre just outside the modern town to the southeast was probably built in the reign of Trajan or Hadrian It accommodated about 8,000 spectators. The most remarkable Roman building is the Porta Nigra, the fortified north gate of the city, 115 ft. long, 75 to 93 ft. high and 29 ft. deep, built of sandstone blocks and held together with iron clamps This building may date from the 1st to the 4th century A.D. It is also called the Simeonstor, after a Greek hermit who inhabited it. In 1035 Archbishop Poppo converted the gate into two churches, one above the other, but all the additions except the apse have been removed. In the southeast of the city are ruins of the Roman imperial palace, and near the bridge substructures of the 4th-century Roman baths, 660 ft. long. On the Constantinsplatz stands the brick basilica, probably of the age of Constantine Converted into a palace for the Frankish kings and their deputies, it passed in 1197 to the archbishops, and was restored (1846–56) and turned into a Protestant church. Another Roman basilica forms the nucleus of the cathedral. Built under the emperors Valentinian I and Gratian as a quadrilateral hall, it was converted into a church about the close of the 4th century, and restored by Bishop Nicetius about 550. It is the most important pre-Carolingian church in Germany. Archbishop Poppo and his successors in the 11th and 12th centuries extended the cathedral and added an apse at each end. The vaulting of the nave and aisles and the cloisters were added in the 13th century. In the vaults are buried 26 archbishops and electors The most famous relic preserved is the "Holy Coat of Trier," believed by the devout to be the seamless robe of the Saviour, and said to have been discovered and presented to the city by the empress Helena. The cloisters connect the cathedral with the Church of Our Lady, a building in the form of a circle intersected by a cross, with a vault, built 1127–43 and said to be the oldest Gothic church in Germany. St Matthias in the south, now represented by a 12th-century building, has a Christian cemetery of the Roman age. A market cross dates from 958, and a beautiful Renaissance fountain, the Petersbrunnen, was erected in 1595. Close by are the Steipe or Rotes Haus, formerly the town hall, of the 15th century, and the Frankenturm or *propugnaculum*, of the 10th century. The provincial museum (1885–89) contains many Roman and mediaeval antiquities, and the town library has valuable examples of early printing. Among its most treasured manuscripts are the *codex aureus*, a copy of the gospels presented to the abbey of St. Maximin by Ada, a reputed sister of Charlemagne, and the *codex Egberti* of the 10th century. At Igel is a remarkable Roman column, 83 ft. high. It dates from the 2nd century, and was the family monument of the Secundini. At Nennig is a fine Roman mosaic pavement.

History.—The Treveri or Treviri, from whom the city derived its name, were among the most powerful tribes of the Belgae, and according to Julius Caesar, who conquered them in 56 B.C., possessed the best cavalry in Gaul. Attempts have been made to show that they were of German origin (*see* BELGAE), but although they were doubtless subject to Germanic influences they spoke a Celtic language. The Roman city, Augusta Treverorum, was probably fortified by Augustus about 14 B.C., and organized as a colony about A.D. 50, in the reign of Claudius, but is not mentioned before the war of Civilis in 69 (Tacitus, *Hist.*, iv). At first the Treveri resisted the appeal of Civilis and his Batavi to join the revolt, and built a defensive wall from Trier to Andernach, but soon after the two Treverans, Tutor and Classicus, led their fellow tribesmen, aided by the Lingones (Langres), in the attempt to set up a "Gallic empire." After a brief struggle the

rebels were overthrown at Trier by Cerealis, and 113 senators emigrated to Germany (70). Mainly on account of its strategic position, Diocletian, on his reorganization of the empire, made Trier the capital not only of *Belgica Prima*, but of the whole "diocese" of Gaul. Constantine the Great, who generally resided here from 306 to 331, and his successors, beautified the city with public works, and villas arose upon the hillsides.

The Franks, who had thrice previously sacked the city, gained permanent possession of it about 455. The city passed to Lorraine in 843, and to the East Frankish kingdom in 870. Hetti, who occupied the see from 814 to 847, is said to have been the first Archbishop of Trier, and Radbod acquired the temporal rights of the counts of Trier in 898. In the 10th century Archbishop Dietrich I. obtained the primacy over Gaul and Germany.

The temporal power of the archbishops was not gained without opposition. The German kings Otto IV. and Conrad IV. granted charters to the city, which, however, admitted the jurisdiction of its archbishop, Baldwin of Luxembourg, in 1308. This prince, a brother of the emperor Henry VII., ruled from 1307 to 1354 and was the real founder of the power of Trier. He raised it to great prosperity by his foresight, and chiefly as a result of the active support he rendered to the emperors Henry VII., Louis the Bavarian, and Charles IV, enlarged his dominions almost to their ultimate extent. He assumed the title of arch-chancellor of Gaul and Arles (or Burgundy), and thenceforward the elector of Trier held the third place in the electoral college. After Baldwin's death the prosperity of Trier was checked by wars and disputes between rival claimants to the see, and in 1456 the estates united for the purpose of restoring order and secured the right of electing their archbishops.

Throughout the middle ages the *sancta civitas Trevirorum* was a great seat of monastic learning. The university, founded in 1473, existed until 1797. The elector Richard von Greiffenklau (1467–1531) successfully opposed the Reformation and inaugurated the exhibitions of the holy coat, which called forth the denunciations of Luther but long after his time continued to bring wealth and celebrity to the city. In the latter half of the 16th century education fell into the hands of the Jesuits

The last elector and archbishop, Clemens Wenceslaus (1768–1802), granted toleration to the Protestants in 1782, established his residence at Coblenz in 1786, and fled from the French in 1794. In 1814 nearly the whole of the former electoral dominions were given to Prussia. A bishopric was again founded in 1821, but it was placed under Cologne. The area of the former electoral principality covered a broad strip of territory along the lower Saar and the Moselle from its confluence with that river to the Rhine, with a district on the right bank of the Rhine behind Ehrenbreitstein. The chief towns in addition to Trier were Coblenz, Cochem, Beilstein, Oberwesel, Lahnstein, and Sayn. The territory under the spiritual authority of the archbishop included the bishoprics of Metz, Toul, and Verdun, and after 1777 also those of Nancy and St. Dié.

Trier was occupied by the 3rd American army from 1918 to 1923 In World War II the town and its aerodrome were damaged by bombing.

See J. N von Wilmowsky, *Der Dom zu Trier in seinen drei Hauptperioden* (Trier, 1874); S. Beissel, *Geschichte der trierer Kirchen* (Trier, 1888); G Kentenich, *Geschichte der Stadt Trier* (Trier, 1915).

TRIESTE, formerly Austrian, but ceded to Italy under the treaty of St. Germain in 1919, a seaport in the district of Venezia Giulia, Italy. capital of the province of Trieste and an episcopal see, situated at the northeast angle of the Adriatic sea, on the Gulf of Trieste, is picturesquely built on terraces at the foot of the Carso. Pop. (1936) 237,717 (town), 248,379 (commune). It is divided into the old and the new town, which are connected by the broad and handsome Via del Corso, the busiest street in the town. The old town, nestling round the hill on which the castle stands, consists of narrow, steep and irregular streets. The new town, which lies on the flat expanse adjoining the crescent-shaped bay, partly on ground that has been reclaimed from the sea, has large and regularly-built streets.

The Austrian-Lloyd Steam Navigation company, which for many years has had its headquarters at Trieste, became the Lloyd-Triestino company, with control of several shipbuilding establishments; it later united with the Cosulich company. There is also a large yard at Muggia (3 mi to the S) with about 1,000 workmen; the other industries include petroleum refineries, iron-foundries, chemicals, soap boiling, silk and cotton spinning, jute works, the production of canned fish, soap, beer and preserves, distilleries, etc.; there are steel works at Servola (three smelters) Several marble quarries are worked in the neighbourhood, and there are some large cement factories. Good wine, fruit and olive oil are the most important natural products of the country round Trieste. Under Austria, Trieste owed its development to its geographical situation in the northeast angle of the Adriatic sea at the end of the deeply indented gulf, and to its harbour, which was more accessible to large vessels than that of Venice. Besides, it was declared a free imperial port in 1719, and was therefore released from the obstruction to trade contained in the hampering legislation of the period. It was deprived of this privilege in 1891, when only the harbour was declared to be outside the customs limit. With the 20th century an active policy was inaugurated. New and direct services were started to East Africa, Central America and Mexico; the service to India and the far east, as well as that to the Mediterranean ports, was much improved, and Trieste was made the centre of the large emigration from Austria to America by the inauguration of a direct emigrant service to New York. Railway communications were also improved, and Trieste, besides being the principal port of Austria, was the centre port for much of Germany's trade with the Mediterranean and the east. By 1924 Trieste had recovered 95% of her prewar trade, but this abnormal "boom" was not maintained, and the competition of Hamburg was felt.

Trieste has two ports, the Porto Emanuele Filiberto Duca d'Aosta and the Porto Vittorio Emanuele III, commonly called Porto Franco. The chief imports include coal, coffee, tobacco, mineral and vegetable oils, fats, flour and rice.

In the years 1930–34 an average of 34,350 ships entered and cleared the port annually, with a total tonnage of 10,400,000. In 1933, 145 ships with a gross tonnage of 587,000 tons were registered in the district (compartments) of Trieste, belonging to 16 companies.

Trieste is connected by rail with Monfalcone (branch for Gorizia and Udine), Treviso and Venice (another line to Gorizia runs across the Carso), with Postumia Grotte, the frontier station on the line to Ljubljana, with Parenzo and with Pola, and by electric railway with Villa Opicina.

About 4 mi. N.W. of Trieste on the very edge of the sea is the famous castle of Miramare, built in 1854–56 for the archduke Maximilian, the ill-fated emperor of Mexico.

History.—After the break-up of the Roman dominion Trieste shared the general fortunes of Istria. From the emperor Lothair II (in 948) it received an independent existence under its count-bishops, and it maintained this position down to its capture by Venice in 1202. For the next 180 years its history consists chiefly of a series of conflicts with this city, which were finally put an end to by Trieste placing itself in 1382 under the protection of Leopold III of Austria. The overlordship thus established insensibly developed into actual possession; and except in the Napoleonic period (1797–1805 and 1809–13) Trieste remained an integral part of the Austrian dominions until 1918, though always a centre of Italian irredentist feeling. It was an imperial free port from 1719 until 1891.

See Giulio Caprin, *Trieste* (Bergamo, 1906); A. Tamaro, *Storia di Trieste* (Trieste, 1924).

TRIFOLIUM, the generic name of the plants commonly called clover (*q.v.*), from the Latin *tres*, three and *folium*, a leaf

TRIFORIUM, in architecture, a longitudinal passage or gallery of a church, or other high ceiled interior, the triforium floor being usually above a side aisle vault or ceiling. The usage of the term is loose; by some it is applied to any second floor gallery opening on to a higher nave by means of arcades or colonnades, like the galleries occurring in some pagan Roman basilicas, or similar galleries in Byzantine churches. In other cases its usage is limited to an arcaded gallery above the side aisle of a mediaeval church and below the clerestory windows, thus occupying the height of the side aisle lean-to roof. The triforium became an integral part of interior church design during the Romanesque

period, sometimes merely as a series of openings to light and ventilate the roof space, and sometimes as a complete open gallery, often vaulted with a quarter circle vault, which transmitted the thrust of the main nave vault to the outside walls, as in the church of S Cernin at Toulouse (begun 1096). With the development of articulated Gothic vaulting in France the usage became confused. At times there was a complete vaulted gallery over the side aisle, which created a lower triforium; in the height of the *lean-to roof* over this a second, minor triforium was developed, as in Laon cathedral (1160–1205), and in Noyon (1150–1200).

In Notre Dame at Paris (1163–96) the upper triforium was originally represented by a series of simple, round openings with rudimentary tracery opening to the roof space. The change in Notre Dame, in the rebuilding (between 1240–58), by which the aisle roofs were flattened, the clerestorey windows heightened and the circular openings eliminated, shows the 13th century dissatisfaction with the old four stage composition, and the upper vaulted gallery is found in few churches of the developed Rayonnant period. Chartres cathedral (1194–1212), Reims cathedral (begun 1220) and Amiens (1220–47) all show triforia of little relative height, but of rich arcading and, in the last, the central mullion of the clerestorey tracery is carried down through the triforium arcading, so as to bind clerestorey and triforium into one composition. In the apse of Amiens, moreover, the flatness of the side aisle roofs allows windows to be placed behind the triforium arcading, which thus becomes, as it were, merely a decorated base to the slim clerestorey above This development reaches its climax in the church of S Urbain at Troyes (1262–80), in which the triforium gallery completely disappears as a separate motif, although it is faintly recalled by the tracery of the clerestorey windows.

In the Flamboyant period the entire omission of the triforium becomes the rule. The English love of horizontal lines shows in a great development of the triforium gallery as an important decorative element in church interiors. In both Norman and Gothic work it is relatively much higher than in similar work in France, often almost equalling the pier arcades. It frequently receives the richest possible treatment, by the use of both tracery and sculpture. The richest and most characteristic example is the angel choir at Lincoln (completed 1282) In the 15th century the tendency toward height of pier arcade and clerestorey window, so clearly shown in Perpendicular work generally, leads to the marked reduction in importance and the final disappearance of the triforium. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE; GOTHIC ARCHITECTURE.) (T. F. H.)

TRIGONOMETRY. To compute numerical results for which geometry would require diagrams plotted to scale is the first function of trigonometry. Such problems as relate to a figure lying wholly in one plane constitute *plane trigonometry;* principally the calculations of certain unknown distances and angles from other known or measured distances and angles. Problems whose diagrams lie in two or more different planes of three-dimensional space are comprised in *spherical trigonometry.* Their relation to a sphere will be shown below. Algebraical discussion of such computations or calculations forms what is called *theoretical trigonometry,* while the numerical work is called concrete or *practical trigonometry.*

PLANE TRIGONOMETRY

All solutions of problems of distance and direction in a plane depend upon finding unknown parts of a triangle when three parts are known (or "given") Most simply, these may be sides and angles, at least one being the length of one side. For calculations involving the size of an angle, the ratios of sides in a right triangle are employed, a right triangle having one angle equal to the given angle, or differing from it by some even number of right angles; or the *supplement* of such an angle. For convenience of measurement and uniformity of language a technical system is adopted, as follows:

The angle to be measured is depicted in a vertical plane, facing the observer. The angle is defined by one straight segment *OA,* called its *initial side,* and a second segment *OB,* its *terminal side.* It is often said to be *generated* by the continuous rotation of a straight segment about the point *O,* from the position *OA* to the position *OB* Since this rotation has two conceivable directions or senses, one is called the negative sense, namely, that performed by the hands of a clock as seen by an observer standing before its face; the opposite sense of rotation is called positive If one could stand at the position of the north pole-star and face toward the sun, the planets of our solar system would appear in their orbits to revolve in the positive sense about the sun.

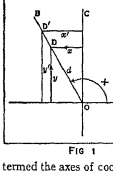

FIG 1

Fix arbitrarily a point *D* on the terminal segment (fig 1), and let *d* denote the distance *OD* Draw a line *OC* perpendicular to *OA* and measure the Cartesian coordinates *x* and *y* of *D,* taking as *x* the distance of *D* from the line *OC* (right or left), and *y* its distance above or below the initial line or that line produced in the direction *AO.* The indefinitely extended lines *OA* and *OC* are termed the axes of coordinates (*see* COORDINATES) in this diagram, *OA* being the *x* axis and *OC* the *y* axis, so that *x* coordinates are parallel to the *x* axis, *y* coordinates parallel to the *y* axis. Coordinates are measured from an axis, to the point *D,* and are positive for an acute angle. Hence on the diagram which is used here, a positive *x* extends from the *y* axis toward the observer's right, a negative *x* toward his left; a positive *y* upward from the *x* axis, a negative *y* downward. These conventional definitions enable us to characterize the picture of any real angle by three real numbers, *d, x* and *y* But any new selection of the point *D* on the terminal line, as *D',* would give a second set of numbers, *d', x', y',* which are proportional to *d, x* and *y.* Accordingly not these numbers, but their ratios, are chosen to describe or measure the angle.

Trigonometric Functions or Ratios, of an Angle.—Six names are assigned to the six ratios of the numbers, *x, y, d.* Some symbol, as *K,* is used for the angle. Then

y/d	is called	the	sine of K,	or $\sin K = y/d$
x/d	"	"	cosine of K,	or $\cos K = x/d$
y/x	"	"	tangent of K,	or $\tan K = y/x$
x/y	"	"	cotangent of K,	or $\cot K = x/y$
d/x	"	"	secant of K,	or $\sec K = d/x$
d/y	"	"	cosecant of K,	or $\operatorname{cosec} K = d/y$

By definition three of these six are reciprocals of three others;

$$\cot K = 1/\tan K,\ \sec K = 1/\cos K,\ \operatorname{cosec} K = 1/\sin K.$$

The sine is also the product of two others; $\sin K = \cos K \cdot \tan K$. Since also the Pythagorean relation connects *x, y* and *d*,—viz., $x^2+y^2=d^2$,—there are quadratic relations or identities among the six ratios. One of these is $\sin^2 K + \cos^2 K = 1$. By the use of these five relations or any equivalent set, when the numerical value of any one ratio or function is known the five others can be found numerically, but not always their plus or minus sign. If however the *sign* of a second ratio is given, a ratio not the reciprocal of the first, then the rest can be found completely.

Limits of Values of the Six Functions.—From the fact that *d* is numerically greater than either *x* or *y,* and that either one of the latter may become equal to zero for some angle which is a whole number of right angles, it is seen that two functions of real angles have outer boundaries, two have inner boundaries, and two are unbounded.

$$-1 \leqq \sin K \leqq (+1), \qquad \sec K \geqq (+1) \text{ or } \sec K \leqq (-1),$$

$$-1 \leqq \cos K \leqq (+1), \qquad \operatorname{cosec} K \geqq (+1) \text{ or } \operatorname{cosec} K \leqq (-1),$$

$\tan K$ and $\cot K$ are unlimited in value.

Unit of Real and Imaginary Angles.—In geometry the unit of angle, a *degree,* was defined as one ninetieth part of a right angle, a *degree* is divided into sixty equal parts called *minutes,* and each minute into sixty equal parts called *seconds.* In terms of these units an angle can be described by three whole numbers if it

does not demand more precise measurement, or it may be described by the aid of a decimal fraction of a unit. Astronomers use degrees, minutes, seconds, and often tenths and hundredths of a second. Land surveyors use degrees and minutes, and sometimes tenths of a minute. For purely theoretical discussions a larger unit is usually employed. This is the *radian* and is best described by saying that π radians are the same as 180 degrees. Using the symbols °, ′, ″ for degrees, minutes, seconds, we may say that

$$1 \text{ radian} = 57°.2957796 = 57°17'44''.81$$
$$1 \text{ degree} = 0.01745329 \text{ radians}$$

Glaisher has calculated the value of the radian to 41 places of decimals.

In calculations regarding angles it may happen that data are used which do not admit the construction of a *real* triangle (or other figure that is sought); then the impossibility will come to light when either: (*a*) the value of some function is given by an equation whose roots are imaginary, or (*b*) the numerical value of some function is excluded by the above statement of boundary values. In either case, (*a*) or (*b*), the angle is said to be *imaginary*.

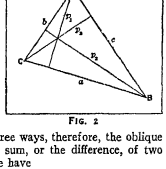

FIG. 2

Dissection of an Oblique Triangle into Right Triangles.—From any vertex of an oblique triangle a perpendicular may be drawn to the opposite side. In three ways, therefore, the oblique triangle may be looked at as the sum, or the difference, of two right triangles. Then, in fig. 2, we have

$$p_1 = b \sin C = c \sin B$$
$$p_2 = a \sin C = c \sin A$$
$$p_3 = a \sin B = b \sin A$$

These equalities give first the

Law of Sines: $$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C};$$

and secondly the three equivalent expressions for the area T of this triangle:

$$T = \tfrac{1}{2}ap_1 = \tfrac{1}{2}bp_2 = \tfrac{1}{2}cp_3$$
$$= \tfrac{1}{2}ab \sin C = \tfrac{1}{2}bc \sin A = \tfrac{1}{2}ca \sin B.$$

In this diagram each side is the algebraic sum of two bases of right triangles, and each base is the product of one side of the triangle multiplied by the cosine of an angle. The three equations from this source are

$$a = b \cos C + c \cos B,$$
$$b = c \cos A + a \cos C,$$
$$c = a \cos B + b \cos A.$$

Two cosines can be eliminated from these equations, leaving a relation among three sides and one angle:

$$b^2 + c^2 - a^2 = 2bc \cos A,$$

or

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}.$$

By this formula the angles can be computed when the three sides are known, if a table of cosines is available. Or, in terms purely geometric, this formula, and the two similar ones for cos B and cos C, reduce the problem from that of constructing the angles of an oblique triangle whose sides are given to that of constructing the angles of a right triangle when the ratio of two sides is given.

Addition of Angles.—The addition theorem, the most comprehensive formula in theoretical trigonometry, results easily from these cosine-equations and the rule of proportionality of sides and sines in a triangle. Since $A+B+C = 180°$, $\sin C = \sin(A+B)$. Also if in a given triangle the ratio $a/\sin A = m$, then $a = m \sin A$, $b = m \sin B$, and $c = m \sin(A+B)$. By these substitutions the third cosine-equation above becomes:

$$m \sin(A+B) = m \sin A \cos B + m \sin B \cos A.$$

This gives the following relation, identically true when A and B are positive real angles with a sum less than 180°.

$$\sin(A+B) = \sin A \cos B + \sin B \cos A.$$

Similar substitutions are made in the formula for cos C,

$$-\cos C = \frac{c^2 - a^2 - b^2}{2ab} = \frac{m^2(\sin^2 C - \sin^2 A - \sin^2 B)}{2m^2 \sin A \sin B}$$
$$= \frac{\sin^2(A+B) - \sin^2 A - \sin^2 B}{2 \sin A \sin B}$$
$$= \frac{\sin^2 A(\cos^2 B - 1) + \sin^2 B(\cos^2 A - 1) + 2 \sin A \sin B \cos A \cos B}{2 \sin A \sin B}$$
$$\therefore -\cos C = \cos(A+B) = \cos A \cos B - \sin A \sin B.$$

The two formulae for sin $(A+B)$ and cos $(A+B)$ are termed the *addition theorem* for the sine and cosine. Either may be derived from the other, together with the statements that supplementary angles have equal sines and that their cosines are numerically equal but unlike in sign. They are valid not only within the limits already stated for A and B, but for real angles of any magnitude, positive or negative. Demonstration of this universal validity is conveniently made by adding 90° to one angle (as A) at a time and observing that sin $(A+90°) = \cos A$, cos $(A+90°) = -\sin A$, and the same for $(A+B+90°)$ and $(A+B)$. Such increase of $A+B$ and A is found to exchange the formulae for sin $(A+B)$ and cos $(A+B)$, whence it is inferred that they are true for angles differing by entire multiples of 90° from acute angles. Further, for imaginary angles the definitions of sine and cosine are taken subject to the postulate that these addition theorems shall remain true.

Functions of Multiples of 90°.—When an angle becomes an exact multiple of 90°, the prescribed rules for constructing x, y, and d will give either $d = x$, $y = 0$ or $d = y$, $x = 0$. This gives for sine and cosine the values in this table:

	0°	90°	180°	270°
sine	0	1	0	−1
cosine	1	0	−1	0

Tangent and cotangent become, for such angles, either zero or infinitely great (0 or ∞).

Functions of Double Angles and Half Angles.—Equal angles, $A=B$, give for sin $(A+B)$ and cos $(A+B)$ the two formulae:

$$\sin 2A = \sin(A+A) = 2 \sin A \cos A,$$
$$\cos 2A = \cos(A+A) = \cos^2 A - \sin^2 A$$
$$= 2\cos^2 A - 1$$
$$= 1 - 2\sin^2 A.$$

The latter gives both the following relations:

$$\sin A = \sqrt{\left(\frac{1 - \cos 2A}{2}\right)}, \quad \cos A = \sqrt{\left(\frac{1 + \cos 2A}{2}\right)},$$

which relations are commonly quoted in the form:

$$\sin \tfrac{1}{2}A = \sqrt{\left(\frac{1 - \cos A}{2}\right)}, \quad \cos \tfrac{1}{2}A = \sqrt{\left(\frac{1 + \cos A}{2}\right)},$$
$$\tan \tfrac{1}{2}A = \sqrt{\left(\frac{1 - \cos A}{1 + \cos A}\right)}.$$

This permits a more convenient solution for the angles of a triangle when the three sides are given. The substitution of $\frac{b^2 + c^2 - a^2}{2bc}$ for cos A, with easy factoring, gives

$$\tan \tfrac{1}{2}A = \sqrt{\left[\frac{(b+a-c)(c+a-b)}{(b+c-a)(a+b+c)}\right]},$$

and this allows the use of logarithms in multiplication and the extraction of a square root.

Factorizing Formulae.—For a more expeditious calculation when logarithms are used, the sum or difference of two sines or of two cosines can be factored. To factor the sum, $\sin P+\sin Q$, one angle is taken as the sum of two auxiliary angles, and the other as their difference, thus:

$$P=A+B,\ Q=A-B,\ A=\tfrac{1}{2}(P+Q),\ B=\tfrac{1}{2}(P-Q).$$

The addition theorem is then applied for $A+B$ and $A-B$, as follows:

$$\begin{aligned}\sin P+\sin Q&=\sin(A+B)+\sin(A-B)\\&=2\sin A\cos B\\&=2\sin\tfrac{1}{2}(P+Q)\cos\tfrac{1}{2}(P-Q).\end{aligned}$$

Similarly,
$$\sin P-\sin Q=2\cos\tfrac{1}{2}(P+Q)\sin\tfrac{1}{2}(P-Q),$$
$$\cos P+\cos Q=2\cos\tfrac{1}{2}(P+Q)\cos\tfrac{1}{2}(P-Q),$$
$$\cos P-\cos Q=-2\sin\tfrac{1}{2}(P+Q)\sin\tfrac{1}{2}(P-Q),$$
$$\sin P+\cos P=2\sin(45^\circ+P)\cos 45^\circ,$$
$$\cos P-\sin P=2\cos(45^\circ+P)\sin_{45}{}^\circ.$$

The first two of these give a useful rule when two sides of a triangle and the included angle are known. Since $\sin A/\sin B=a/b$,

$$\frac{a-b}{a+b}=\frac{\sin A-\sin B}{\sin A+\sin B}=\frac{2\cos\frac{1}{2}(A+B)\sin\frac{1}{2}(A-B)}{2\sin\frac{1}{2}(A+B)\cos\frac{1}{2}(A-B)}$$
$$=\frac{\tan\frac{1}{2}(A-B)}{\tan\frac{1}{2}(A+B)}=\tan\tfrac{1}{2}(A-B)\tan\tfrac{1}{2}C.$$

Other formulae for transformation purposes are derived from the addition theorem and the primitive reciprocities and Pythagorean relations, together with the premise that, in a plane triangle, $A+B+C=180^\circ$. Of frequent use are the formulae for radii of the circles inscribed and circumscribed respectively to a triangle:

$$r=\sqrt{\left[\frac{(a+b-c)(a-b+c)(-a+b+c)}{4(a+b+c)}\right]},$$
$$R=\frac{abc}{\sqrt{[(a+b+c)(a+b-c)(a-b+c)(-a+b+c)]}}.$$

Calculation of Tables.—When the radian is used as unit, small angles like 1° or 5° are represented by decimal fractions less than 0·1. The sine and cosine of x radians are represented by convergent series in ascending powers of x:

$$\sin x=x-\frac{x^3}{3!}+\frac{x^5}{5!}-\frac{x^7}{7!}+\cdots,$$
$$\cos x=1-\frac{x^2}{2!}+\frac{x^4}{4!}-\frac{x^6}{6!}+\cdots.$$

For $x\leqq\frac{1}{10}\pi$, these functions can be computed with no error in the 10th decimal place by using five terms of the series. For larger angles, more terms can be used, or the addition theorem can be employed. From 1° up to 45° it saves labour to apply the relations

$$\sin(30^\circ\pm x)=\tfrac{1}{2}\cos x\pm\frac{\sqrt{3}}{2}\sin x,$$
$$\cos(30^\circ\pm x)=\frac{\sqrt{3}}{2}\cos x\mp\tfrac{1}{2}\sin x.$$

Beyond 45° of course no further calculation is necessary, since

$$\sin(45^\circ+x)=\cos(45^\circ-x),$$
and
$$\cos(45^\circ+x)=\sin(45^\circ-x).$$

Most sets of trigonometric tables therefore give values of the various functions for angles from 0° to 45°, and apply a system of double titles for completing the first quadrant.

Multiples of an Angle. De Moivre's Formula.—The inscription of regular polygons in a circle is parallel to the solution of an algebraic equation for $\sin x$ or $\cos x$ when $\sin(nx)$ or $\cos(nx)$ is a known quantity, n denoting any integer. To express $\sin(nx)$ in terms of $\sin x$ is a problem for the addition theorem of sines. It is shortened by De Moivre's (or Euler's) formula, itself a direct consequence of that addition theorem. Denote by i the imaginary unit $\sqrt{-1}$. The formula is this:

$$\cos(nx)+i\sin(nx)=(\cos x+i\sin x)^n.$$

The binomial theorem gives the expansion of the second member, terms in odd powers of $\sin x$ being imaginary, while the first and alternate terms are real. The sum of real terms is then the desired expression for $\cos(nx)$; the others, divided by i, give $\sin(nx)$. Compare the treatment of hyperbolic functions, below.

Trigonometric or Fourier Series.—Many functions, especially periodic functions, can be calculated most easily by convergent series proceeding by sines, or cosines (or both), of integral multiples of a variable angle. This topic is best treated in differential calculus (*see* CALCULUS). An interesting example, of little value, however, is this:

$$\frac{x}{2}=\sin x-\frac{\sin 2x}{2}+\frac{\sin 3x}{3}-\frac{\sin 4x}{4}+\cdots.$$

SPHERICAL TRIGONOMETRY

Figures composed of lines and points in a plane are accessible to computation through triangles, and these in turn through right triangles. In the totality of lines and planes radiating from a point in ordinary space of three dimensions the useful instrument for computation is that consisting of three lines or rays—half lines starting from a common point—and the three plane angles which are bounded each by two of these three lines. It is usually agreed to restrict these angles to be not over 180° each, and to fix the same limit for the dihedral angles whose edges are the three lines first mentioned. The plane angles are called *face-angles*, angles formed by two planes at any edge are *dihedral angles*, and the complete figure of six parts is a *trihedral* or *solid angle*. If the point (or vertex) lies at the centre of a sphere, the edges and faces cut the spherical surface in points and arcs of great circles that constitute a spherical triangle. The sides and angles of this spherical triangle have the same measures (in degrees or radians) as the plane and dihedral angles of the trihedral angle. The capitals A, B, C may be used for the positions and for the measures of the angles at the vertices, and a, b, c for the measures of the three plane angles (face angles) of the arcs of the triangle.

Right Trihedral Angles or Spherical Triangles.—If two planes of the trihedral angle are perpendicular, *e.g.*, if the angle C of the intercepted spherical triangle is 90°, the latter is a *right spherical triangle* and subtends a right trihedral angle. If a side (a face angle) is 90°, the triangle and its trihedral angle are called a *quadrantal triangle*. In contrast to the plane triangle, two or even three angles of the triangle may be right angles; in the one case two and in the other case three of the sides will then be quadrants or quarter-circles of the sphere, and the triangles will be biquadrantal, or else equilateral (trirectangular or triquandrantal).

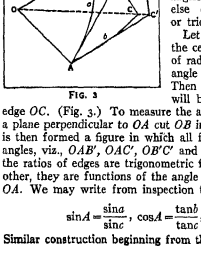

FIG. 3

Let a trihedral angle at O, the centre, intercept on a sphere of radius R a right spherical triangle ABC, right angled at C. Then the planes AOC and BOC will be perpendicular along the edge OC. (Fig. 3.) To measure the angle whose edge is OA, let a plane perpendicular to OA cut OB in B', and OC in C'. There is then formed a figure in which all four triangles are right triangles, viz., OAB', OAC', $OB'C'$ and $AB'C'$. In three of these, the ratios of edges are trigonometric functions of c, b, a; in the other, they are functions of the angle A or of the dihedral angle OA. We may write from inspection these three relations:

$$\sin A=\frac{\sin a}{\sin c},\ \cos A=\frac{\tan b}{\tan c},\ \tan A=\frac{\tan a}{\sin b}.$$

Similar construction beginning from the edge OB gives the three

formulae:

$$\sin B = \frac{\sin b}{\sin c},\quad \cos B = \frac{\tan a}{\tan c},\quad \tan B = \frac{\tan b}{\sin a}.$$

By proper elimination, four more relations, each among three parts of the spherical right triangle, can be derived algebraically from these six, as follows:

$$\cos c = \cos a \cos b, \qquad \cos c = \cot an A \cot an B,$$

$$\cos A = \cos a \sin B, \qquad \cos B = \cos b \sin A.$$

The ten formulae suffice for computing any desired part when two parts beside the right angle are given. The last three of these ten determine the sides when two angles are given, a case having no parallel in plane triangles.

Napier's Rules.—Two "Napier's Rules" form a mnemonic for these ten relations. They relate not to the actual parts (viz., a, B, c, A, b, C), but to a set of so-called "Napier's Parts," amongst which the right angle C does not appear. These are thought of as follows:

$$a,\ 90°-B,\ 90°-c,\ 90°-A,\ b,\ a,\ 90°-B, \text{ etc.},$$

in cycle. Each Napier's part is *adjacent* to two in the cycle, the one next preceding and the one immediately following it in the cycle. The rules read:

1) The *sine* of any middle part is the product of the *tangents* of the *adjacent* parts,

2) The *sine* of any middle part is the product of the *cosines* of the *opposite* parts.

Here *opposite* means *non-adjacent*. When any three Napier's parts are specified, of the five excluding the right angle C, either they are consecutive in the cycle, and then the first and third are called *adjacent* to the second; or only two are consecutive, in which case they are both called opposite to the third. These formulae solve most of the problems arising in geodetic navigation, and the problems of celestial astronomy concerning an altitude and an azimuth.

Polar Triangles: Quadrantal Triangles.—There is a unique relation between two trihedral angles, each *polar* to the other. The interior and exterior spaces of a trihedral angle must be defined. Given three half-lines OA, OB, OC, and the plane angles, each less than 180°, which they bound, produce indefinitely AO, BO, and CO, to A_1, B_1, and C_1. Through O draw any other line ODD_1, not in any face plane (fig. 4). If from D_1, but not from D, a point can move continuously to A_1 without crossing the interior of any face angle or any edge, then D is an interior point and D_1 is an exterior point. If both D_1 and D can be so moved, then both are exterior to the trihedral angle O—ABC. Take D an interior point, and from it draw three half-lines intersecting perpendicularly the three faces of the first trihedral angle. On the half-line perpendicular to AOB mark any point C_2, and similarly mark two other points A_2, B_2. The edges DA_2, DB_2, DC_2, define a second trihedral angle called *polar* to the first. The relations of perpendicularity among lines and planes show that also the first is polar to the second trihedral angle. In solid geometry it is shown, as is visible if one will construct a model, that each dihedral angle in either is the supplement of a face-angle in the other. If the first is a right-trihedral angle (spherical triangle), the second is quadrantal, and vice versa. There is no need of new formulae for a quadrantal triangle, since the ten given already for a right triangle can be altered by merely exchanging small letters for capitals and reciprocally, and changing the sign prefixed to every *cosine*.

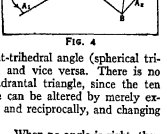

FIG. 4

Oblique Spherical Triangles.—When no angle is right, then from any point in an edge OC two planes can be passed, each perpendicular to one other edge, both therefore containing a line CX, of length p, perpendicular to the plane AOB (fig. 5). From such a figure it is seen that

$$\frac{\sin A}{\sin B} = \frac{\sin a}{\sin b}, \text{ since } \frac{p/l_1}{p/l_2} = \frac{l_2/r}{l_1/r}.$$

From this, since A and B were any two angles of the triangle, there follows the *sine theorem* for every trihedral angle or spherical triangle,

$$\frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c}.$$

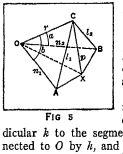

FIG 5

From a slightly different diagram (fig. 6), come formulae connecting three faces and a dihedral angle, or three angles and a face

At a point C on one edge, perpendiculars to OC are erected, terminating in A and B on the two other edges; also a perpendicular k to the segment AB at P. This point P is now connected to O by k, and other parts of the six right triangles are lettered as in the accompanying sketch. We then have the face angle $C = \alpha+\beta$; now call the corresponding parts of angle C,

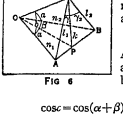

FIG 6

γ_1 and γ_2, and we have $C = \gamma_1+\gamma_2$.

Applying the addition theorem for cosines and referring the segments involved to r by ratios in right triangles, we have

$$\cos c = \cos(\alpha+\beta) = \cos\alpha\cos\beta - \sin\alpha\sin\beta = \frac{h^2 - m_1 m_2}{n_1 n_2},$$

$$\cos C = \cos(\gamma_1+\gamma_2) = \cos\gamma_1\cos\gamma_2 - \sin\gamma_1\sin\gamma_2 = \frac{k^2 - m_1 m_2}{l_1 l_2}.$$

Hence $$r^2 = h^2 - k^2 = n_1 n_2 \cos c - l_1 l_2 \cos C,$$

$$1 = \frac{n_1}{r}\cdot\frac{n_2}{r}\cos c - \frac{l_1}{r}\cdot\frac{l_2}{r}\cos C = \frac{\cos c}{\cos a \cos b} - \tan a \tan b \cos C,$$

or $$\cos c = \cos a \cos b + \sin a \sin b \cos C,$$

whence also $$\cos a = \cos b \cos c + \sin b \sin c \cos A, \tag{1}$$

and $$\cos b = \cos c \cos a + \sin c \sin a \cos B.$$

But this trihedral angle is the polar of another, for which those same three cosine formulae are true. In them we may substitute for face-angles and dihedrals the *supplements* of the dihedrals and of the face-angles respectively, cosines and tangents reversing sign. The results are, for this first trihedral angle,

$$\cos A = -\cos B \cos C + \sin B \sin C \cos a,$$

$$\cos B = -\cos C \cos A + \sin C \sin A \cos b, \tag{2}$$

and $$\cos C = -\cos A \cos B + \sin A \sin B \cos C.$$

From set (1), dihedral angles may be calculated in terms of the face-angles; but derived formulae for halves of the dihedrals are more convenient for logarithmic computation, as when in plane triangles the angles are to be found from the sides. Since

$$\cos A = \frac{\cos a - \cos b \cos c}{\sin b \sin c},$$

it follows that

$$\sin^2 \tfrac{1}{2} A = \frac{1 - \cos A}{2} = \frac{\cos(b-c) - \cos a}{2 \sin b \sin c} = \frac{2 \sin \tfrac{1}{2}(b-c+a) \sin \tfrac{1}{2}(a-b+c)}{2 \sin b \sin c},$$

or, if $a+b+c = 2s$,

$$\sin^2 \tfrac{1}{2} A = \frac{\sin(s-b)\sin(s-c)}{\sin b \sin c}; \tag{3}$$

and similarly $$\cos^2 \tfrac{1}{2} A = \frac{\sin s \cdot \sin(s-a)}{\sin b \cdot \sin c}; \tag{4}$$

and $$\tan \tfrac{1}{2} A = \sqrt{\left[\frac{\sin(s-b)\cdot\sin(s-c)}{\sin s \cdot \sin(s-a)}\right]}. \tag{5}$$

The polar triangle converts these formulae into expressions for half-sides in terms of the three dihedral angles; or they may be derived in the same way from set (2) above. They are, when S denotes $\frac{1}{2}(A+B+C)$,

$$\sin^2\frac{a}{2} = \frac{-\cos S\cos(S-A)}{\sin B\sin C}, \tag{6}$$

$$\cos^2\frac{a}{2} = \frac{\cos(S-B)\cos(S-C)}{\sin B\sin C}, \tag{7}$$

$$\tan\frac{a}{2} = \sqrt{\left[-\frac{\cos S\cos(S-A)}{\cos(S-B)\cos(S-C)}\right]}. \tag{8}$$

Gauss's Equations.—The *Gauss equations* are four relations deducible from (3), (4), (6), and (7). Restrict the trihedrals to having positive face-angles less than 180°, and dihedral angles with the same limitations; then the right-hand members of equations (3), (4), (6) and (7) are all positive, and their positive square roots must be taken. From the set represented by (3) and (4), substitute in the addition formula

$$\sin\tfrac{1}{2}(A+B) = \sin\frac{A}{2}\cos\frac{B}{2} + \cos\frac{A}{2}\sin\frac{B}{2},$$

and thus find

$$\cos\frac{c}{2}\sin\tfrac{1}{2}(A+B) = \cos\frac{c}{2}\sqrt{\left[\frac{\sin s\sin(s-c)}{\sin a\sin b\sin^2 c}\right]}\cdot[\sin(s-b)+\sin(s-a)]$$
$$= \cos\frac{C}{2}\cos\frac{a-b}{2}.$$

Not very different are three other proofs. The set of four is this:

$$\begin{aligned}
\cos\frac{a}{2}\sin\tfrac{1}{2}(B+C) &= \cos\frac{A}{2}\cos\tfrac{1}{2}(b-c),\\
\cos\frac{a}{2}\cos\tfrac{1}{2}(B+C) &= \sin\frac{A}{2}\cos\tfrac{1}{2}(b+c),\\
\sin\frac{a}{2}\sin\tfrac{1}{2}(B-C) &= \cos\frac{A}{2}\sin\tfrac{1}{2}(b-c),\\
\sin\frac{a}{2}\cos\tfrac{1}{2}(B-C) &= \sin\frac{A}{2}\sin\tfrac{1}{2}(b+c).
\end{aligned} \tag{9}$$

Professor Simon Newcomb is authority for the statement that these equations were first published anonymously by Delambre, although Gauss was the first to use them in spherical astronomy. It is evident that they solve directly any triangle in which three consecutive parts are known, either two sides and the included angle, or two angles and the side adjacent to both. Where all parts are less than 180°, so that the tangent is a sufficient index of the quadrant in which a part lies, Napier's analogies are the better statement of the solution.

Napier's Analogies.—These analogies are found by division from pairs in set (9), as follows:

$$\frac{\sin\frac{1}{2}(B+C)}{\sin\frac{1}{2}(B-C)} = \frac{\tan\frac{a}{2}}{\tan\frac{1}{2}(b-c)}, \quad \frac{\sin\frac{1}{2}(b+c)}{\sin\frac{1}{2}(b-c)} = \frac{\operatorname{cotan}\frac{A}{2}}{\tan\frac{1}{2}(B-C)},$$

$$\frac{\cos\frac{1}{2}(B+C)}{\cos\frac{1}{2}(B-C)} = \frac{\tan\frac{a}{2}}{\tan\frac{1}{2}(b+c)}, \quad \frac{\cos\frac{1}{2}(b+c)}{\cos\frac{1}{2}(b-c)} = \frac{\operatorname{cotan}\frac{A}{2}}{\tan\frac{1}{2}(B+C)}.$$

By the use of the polar triangle (or trihedral angle), the analogies are exchanged reciprocally two and two; while of the Gauss equations, two are exchanged, the others being self-reciprocal.

Equations of set (1) or (2), have been used here as fundamental, and that asserting proportionality of four sines, as derivative. A different selection is of course possible. While those given above suffice for the logarithmic solution of spherical triangles from any three given parts, and for checks, there is a great variety of other relations adapted to special sets of data, either saving labour or admitting of greater accuracy from the same set of tables.

Hyperbolic Functions.—Trigonometric functions are algebraically related to the sine or cosine. Sine and cosine of a real variable quantity, represented as rectangular coordinates in a plane, define a point whose locus is a circle of unit radius about the origin as centre. They may be defined either by this geometric property; or better, by two absolutely convergent series:

$$\sin\theta = \theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} - \frac{\theta^7}{7!} + \cdots,$$

$$\cos\theta = 1 - \frac{\theta^2}{2!} + \frac{\theta^4}{4!} - \frac{\theta^6}{6!} + \cdots.$$

Both converge for all values of θ, and are periodic with the common modulus 2π. Their relation to the circle is expressed by the identity: $\sin^2\theta+\cos^2\theta\equiv 1$. Further, it is shown in the theory of limits (*see* LIMITS) usually given in treatises on differential calculus, that the relation of these two functions and their derivatives is nearly reciprocal, viz., in radian units,

$$\frac{d(\sin\theta)}{d\theta} = \cos\theta, \quad \frac{d(\cos\theta)}{d\theta} = -\sin\theta;$$

in other words, each is an integral of the differential equation

$$\frac{d^2u}{d\theta^2} = -u.$$

Two functions resembling these in the features mentioned are the *hyperbolic sine* and *hyperbolic cosine*, abbreviated to $\sinh\theta$ and $\cosh\theta$. They are defined by absolutely convergent series:

$$\sinh\theta = \theta + \frac{\theta^3}{3!} + \frac{\theta^5}{5!} + \frac{\theta^7}{7!} + \cdots,$$

$$\cosh\theta = 1 + \frac{\theta^2}{2!} + \frac{\theta^4}{4!} + \frac{\theta^6}{6!} + \cdots.$$

So far however as a real variable θ is concerned, these functions are not periodic. Their modulus of periodicity is imaginary. The identity connecting them is geometrically the equation of an equilateral (or rectangular) hyperbola,

$$\cosh^2\theta - \sinh^2\theta \equiv 1.$$

Their interest for the physicist or engineer arises from their completely symmetrical or reciprocal differential relations:

$$\frac{d(\sinh\theta)}{d\theta} = \cosh\theta, \quad \frac{d(\cosh\theta)}{d\theta} = \sinh\theta.$$

Both are solutions of the differential equation of the second order

$$\frac{d^2u}{d\theta^2} = +u.$$

Analogous to the trigonometric functions the hyperbolic tangent, cotangent, secant, and cosecant are defined as follows:

$$\tanh\theta = \frac{\sinh\theta}{\cosh\theta}, \ \coth\theta = \frac{\cosh\theta}{\sinh\theta}, \ \operatorname{sech}\theta = \frac{1}{\cosh\theta}, \ \operatorname{cosech}\theta = \frac{1}{\sinh\theta}.$$

The first two are mutually reciprocals: $\tanh\theta\cdot\coth\theta\equiv 1$, and are related to the latter two by the equations: $\operatorname{sech}^2\theta \equiv 1-\tanh^2\theta$, $\operatorname{cosech}^2\theta \equiv \coth^2\theta - 1$.

Like the inverse trigonometric, or circular functions, the inverse hyperbolic functions are usefully represented as integrals. Some writers indeed prefer to define them by integration, as follows:

$$\sinh^{-1}y = \int_0^y \frac{dy}{\sqrt{(y^2+1)}}, \quad \cosh^{-1}x = \int_1^x \frac{dx}{\sqrt{(x^2-1)}}.$$

It follows then that

$$\sinh u = \frac{e^u - e^{-u}}{2}, \ \cosh u = \frac{e^u + e^{-u}}{2},$$

as at first defined, while

$\sinh^{-1}y=\log[y+\sqrt{(y^2+1)}]$, $\cosh^{-1}x=+\log[x\pm\sqrt{(x^2-1)}]$.

The addition theorem is evidently

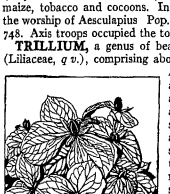
$$\sinh(u+v)=\sinh u\cosh v+\cosh u\sinh v,$$
$$\cosh(u+v)=\cosh u\cdot\cosh v+\sinh u\sinh v.$$

Misled by apparent implication in the names, some suppose that the Jacobian elliptic functions sin *am u*, cos *am u*, etc., resemble the trigonometric and hyperbolic functions as closely as these sets resemble one another. That this is far from correct may be seen at once by consulting the article on ELLIPTIC FUNCTIONS.

HISTORY

The beginnings of trigonometry in explicit form may perhaps be traced to the lost work of a Greek, Hipparchus of Nicaea (*c.* 140 B.C.), which is said to have comprised twelve books with tables *On Chords of Circles*. Apparently Egyptian builders of the pyramids knew of fixed ratios in similar triangles, and they had a name *seqt* for the cosine of an angle, but there is no known record of tables or of further theory. Three books of Menelaus of Alexandria show that interest in astronomy had induced more progress in spherical than in plane trigonometry. To advance toward its modern form, the science needed more named ratios or functions, tabulated, being like a language scantily supplied with nouns. In India, six centuries later, chords were halved, and became what we now call *sines*, appearing in the writings of Aryabhaṭa (*c.* A.D. 500) and Brahmagupta (*c.* A.D. 620). The knowledge of India passed into the keeping of the Arabs, and Al Battani (*c.* A.D. 900) gave names to functions now called cotangent and secant. Still later (*c.* A.D. 1250), there came a systematizer, the Persian Nasīr ed-dīn al-Tūsī, who collected and supplemented older knowledge into a coherent whole. The sine theorem was employed wherever possible; but, lacking the cosine theorem, he resorted when necessary to auxiliary right triangles to solve problems in oblique triangles.

Among modern writers, the first to exhibit trigonometry as a science was the German Johann Muller, better known as Regiomontanus (*c.* 1460). He seems to have invented the tangent, traces of which have been suspected, however, in the ancient Egyptian Ahmes ms. (*c.* 1650 B.C.) while the secant was reintroduced *c.* 1500 by Copernicus. Vieta, in Paris in the latter part of the sixteenth century, brought algebra and particularly algebraic transformations into the service of trigonometry. Euler, in the mid-eighteenth century, recast, simplified, and gave elegance to the body of rules and technique, by this time so necessary for navigation and the physical sciences. The name, trigonometry, probably originated with Pitiscus (Heidelberg, 1593).



The first discoverers of leading theorems and formulae must of course be named with an implied proviso. For plane triangles the sine theorem narrowly missed by Al Battānī and the Spanish Moor Jabir Ibn Aflah (*c.* 1140), was enunciated by Nasīr ed-dīn al-Tūsī (*c.* 1250). The cosine theorem in complete form is first found in Vieta's work of 1593, *Variorum de rebus mathematicis responsorum liber octavus*. The same author restated the tangent theorem in the accepted form of today, in 1593. It stands however unmistakable in the work of a Dane, Thomas Fincke, ten years earlier, save that the angle $\frac{1}{2}(A+B)$ is expressed as $\frac{1}{2}(180-C)$, a form immediately applicable to the usual data. Formulae for finding angles directly from the sides, without auxiliary right triangles, appear first with Rhaeticus of Wittenberg in a work written in 1568, published in 1596. He gives the rule for $\tan\frac{1}{2}A$. Rules for the sine and cosine of the half-angle are certainly as old as Oughtred's *Trigonometrie* of 1657. Proportions for sines and cosines, of $\frac{1}{2}(A+B)$ and of $\frac{1}{2}(A-B)$ are found, the sines in Newton's writings, 1707, and both functions appear in F. W. Oppel's *Analysis Triangulorum*, 1746.

The six triadic relations in spherical right triangles evolved during long centuries, first of course in words stating proportions, later in the short-hand of equations. Menelaus of Alexandria (*c.* A.D. 100) and Ptolemaeus (*c.* A.D. 140) give most of them, and all were known to Nasīr ed-dīn al-Tūsī (*c.* 1250). For oblique spherical triangles, the sine theorem was found by the early Arabians. It was known to Abū'l-Wafā (*c.* 980), and possibly to his contemporaries Abū Nāṣr or al-Khojendī (al-Chodschendi), in the tenth century of our era. The cosine theorem was implied in what is known to the early Indians, but was exhibited more fully by Regiomontanus (*c.* 1460), and ultimately by Tycho Brahe (before 1590). Gauss's formulae of 1809 were found earlier by Delambre (1807) and Mollweide (1808). Napier's analogies, curiously enough, arrived much earlier, 1619, in Napier's work, and were practically exhibited by Briggs in 1620.

TRIKKALA (anc. *Trikka*), a town of Thessaly, Greece, capital of department of Trikkala, and see of an archbishop, 38 mi. W. of Larissa. In winter, when great numbers of Vlach herdsmen settle in the town, its population exceeds that of Larissa. It has the appearance of a Mussulman town on account of its mosques (only two of which are in use) and is a centre of trade in wheat, maize, tobacco and cocoons. In ancient times it was a seat of the worship of Aesculapius. Pop. 23,470, of the department, 214,748. Axis troops occupied the town in April 1941.

TRILLIUM, a genus of beautiful plants of the lily family (Liliaceae, *q.v.*), comprising about 30 species, natives of North America and eastern Asia. They are smooth low perennials, with a simple stem bearing at the top a whorl of three leaves and a single conspicuous flower. There are three green sepals, three showy petals, six stamens and a three-celled ovary; the fruit is a many-seeded berry. Some 18 species occur in the United States and Canada; these include many handsome spring wild flowers, known as wake-robin and birthroot. Well-known eastern species are the great white trillium (*T. grandiflorum*), the bethroot (*T erectum*), the painted wake-robin (*T. undulatum*) and the mountain wake-robin (*T. stylosum*).

BY COURTESY OF THE WILD FLOWER PRESERVATION SOCIETY

TRILLIUM OR WAKE ROBIN (TRILIUM SESSILE), ONE OF THE LILY FAMILY HAVING BROWNISH PURPLE FLOWERS

TRILOBITA, a group of extinct Arthropoda of which the fossil remains are found in the rocks of the Palaeozoic era. Many species are found in the Lower Cambrian, among the earliest known fossils. They are abundant in the Ordovician and Silurian when they begin to decline and only three genera survive in the Permian.

A typical trilobite has a segmented body roughly resembling that of a wood-louse, with the dorsal surface marked by two longitudinal furrows which divide it into the three lobes alluded to in the name of the group. In the head-region the middle lobe is the glabella and usually shows transverse grooves marking the five segments of which the head is composed. On either side of the head are plates, the "free cheeks," divided from the central part of the head by the "facial sutures" and bearing the compound eyes. In some trilobites, however, the eyes are reduced or absent. Behind the head a number of the body-segments, from two to 44, are freely movable, and they are followed by a tail-shield or "pygidium" which often shows, by transverse furrows, that it is composed of a number, sometimes a large number, of segments. Most

trilobites, after the Cambrian, could roll up into a ball like many wood-lice and are often found in this condition.

For long no definite traces of the limbs of trilobites could be discovered and their nature was the subject of much speculation. They have now been described in several genera by C. D. Walcott, C. E. Beecher and P. E. Raymond. The structure is most fully known in *Triarthrus*, investigated by Beecher and by Raymond. The appendages of the first pair, placed at the sides of the forelip (hypostoma) which underbangs the mouth, are long, slender, many-jointed antennae. The remaining appendages are all similar in structure and are attached, four pairs to the head and one pair each to the somites of the body whether free or coalesced into the pygidium. They are two-branched, the inner branch (endopodite) being a jointed leg, while the outer (exopodite) bears a fringe of what seem to be stiff flattened bristles. The two branches spring from a single basal segment drawn out on the inner side as a jaw-lobe (gnathobase) which served, no doubt, to seize food and pass it forward to the mouth. Towards the hinder end of the body the appendages become smaller and the inner edge of the endopodite is lobed in a way recalling the appendages of the Branchiopod Crustacea. In *Neolenus* another point of resemblance to certain Branchiopoda is provided by a pair of long thread-like tail-filaments. Walcott believed the structure of the limbs to be more complex, certain genera possessing, in addition to the parts mentioned, two or three "epipodites," but the presence of these awaits confirmation. Still less probable is Walcott's conclusion that *Calymmene* and *Ceraurus* possessed corkscrew-like gills.

The development of various species has been traced. Starting with a minute larva with only indications of head and pygidium, segments appear between these regions in order from behind forwards, the new segments being set free in succession from the front edge of the pygidium. The relationships of trilobites to the various groups of Arthropoda now living have been the subject of much discussion but the elucidation of their appendages leaves no doubt that their main affinities are with the Crustacea (*q.v.*). The five pairs of appendages on the head-region are directly comparable with those of Crustacea, since the second pair or antennae of Crustacea are still postoral and biramous and carry a masticatory process or gnathobase in the nauplius larva as in the trilobites. The biramous form of all the postoral limbs is also a weighty argument in favour of crustacean affinity. On the other hand, there is no trace of the characteristic crustacean shell-fold or carapace. In the uniformity of the postoral appendages, however, the trilobites are more primitive than any living crustacean. The view that trilobites are phylogenetically connected with Arachnida (*q.v.*) has less to support it, but it is possible that connecting links may yet be proved to exist in the imperfectly known Cambrian *Limulava* of Walcott.

The trilobites were all marine and lived, some on sandy or muddy bottoms, some on coral reefs, and some, perhaps, in the deep sea. They were distributed all over the world and in some localities were in such abundance that rock strata are crowded with their remains. A very large number of genera and species are known. Their range of size is from a quarter of an inch to 27 in. in length, but most species are between one and three inches long.

(W. T. C.)

TRIM, a market town and the county town of Co. Meath, Ireland, on the upper waters of the Boyne, 30 mi. N.W. by W. from Dublin on a branch of the Great Southern railway. Pop. (1951) 1,309. Monthly fairs are held, and there is considerable trade in corn and flour. The town was the seat of a very early bishopric. A Norman tower, called the Yellow Steeple, is supposed to mark the site of St. Patrick's Abbey of St. Mary. Two gates remain from the old town walls. King John's castle was originally founded by Hugh de Lacy in 1173, but a later date is assignable to the greater part of the building. Other castles are Talbot's and Scurlogstown castles; the former erected by Sir John Talbot, lord lieutenant of Ireland in 1415, the latter dating from 1180. About a mile east of the town, the ruins of the abbey of St. Peter and St. Paul occupy both banks of the river. These include the Transitional-Norman cathedral on the north bank, and a castle guarding the crossing of the river on the south, together with a chapel and other remains. North of the town ruins may be seen of a 13th century Dominican friary. The tower of the old parish church dates from 1449. Several Irish parliaments met at the castle until the middle of the 15th century, and a mint was established in 1469. The town was incorporated by Edward III.

TRIMONTIUM, according to Ptolemy (ii. 3, 6) a "city" in the territory of the Selgovae, was probably the name of the Roman fort at Newstead, near Melrose, Scotland, close under the three Eildon Hills (whence the name *trium montium*). It was an advanced post of the Romans towards Scotland from about A.D. 80 onwards, and again (after an interval of evacuation) from about A.D. 140–180. Excavations carried out between 1907 and 1911 yielded finds of almost unique importance. These included the foundations of several successive forts, one above the other, which throw much light on the character of the Roman military post, an unparalleled collection of Roman armour, notably ornate helmets, and a good series of coins and datable pottery. The whole illustrate the history of the Roman army and that of Roman Scotland very remarkably and to an extent equalled by no other Scottish site as yet explored.

See James Curle, *A Roman Frontier Post and its People* (Glasgow, 1911).

TRINCOMALEE, a town and former naval station on the northeast coast of Ceylon, 100 m. N.E. by N. of Kandy. Pop. (1931) 10,160. It is built on the north side of the bay of Trincomalee, on the neck of a bold peninsula separating the inner from the outer harbour. The annual average rainfall is 64.8 inches and the average temperature 81.2° F.

The town was one of the first Tamil settlements in Ceylon. The great temple, dedicated to Konatha, or Konasir, on a height at the extremity of the peninsula, was known as the "temple of a thousand columns." The building was destroyed in 1622 by the Portuguese. The town was successively held by the Dutch (1639), the French (1673), the Dutch (1674), the French (1782), and the Dutch (1783). It surrendered to the British fleet in 1795, and with other Dutch possessions in Ceylon was ceded to Great Britain by the Treaty of Amiens in 1802

With its magnificent harbour—one of the five or six greatest natural harbours in the world—it used to be the headquarters of the admiral commanding on the East Indian station and had a military garrison. Pearl oysters are found in the lagoon of Tambalagam to the west of the bay. Some tobacco, rice, and coco-nuts are grown in the district.

Rice and general merchandise are imported while paddy, timber, dried fish, tobacco, deer horns and skins are exported. The merchant anchorage in the harbour is in 4 to 8 fathoms about 4 cable lengths from the wharf. The harbour can accommodate the largest vessels.

TRING, an urban district in Hertfordshire, England, 31½ mi. N.W. of London on the London Midland Region railway. Pop. (1951) 5,018. Area 6.9 sq mi. It lies on the western slope of the Chiltern hills, close to the entrance to a narrow valley which pierces them and forms one of the highways through them to London. The Rothschild museum contains an extensive natural history collection. The road which passes through Tring follows the ancient Icknield way, and there may have been a Romano-British village on the site of the present town

TRINIDAD, a town near the southern coast of Cuba, in Las Villas province, about 45 mi. southeast of Cienfuegos, and 3 mi. from its seaport, Casilda, which lies due south. Pop. (1943) 15,453. There is a local railway, connected with the central trunk line of the island. The city lies on the slope of La Vigia hill (900 ft.) amid higher mountains, and on the banks of the Jayoba (San Juan) river. Casilda has a land-locked, shallow harbour; but Masio bay, a trifle farther distant, accommodates larger craft; and there are excellent deep-water anchorages among the quays off the coast. The Manatí river is navigable for about 7 mi. inland and is used as an outlet for sugar and molasses crops. These and honey are the chief exports; tobacco and various vegetables and fruits are of minor importance. Trinidad is one of the seven original cities of Cuba established by Diego Velásquez. It was founded in 1514 on the coast, but after being attacked by pirates

was removed inland. It was thrice sacked by English buccaneers—in 1642, 1654 and 1702. The late 18th century witnessed the development of sugar in this area on a scale that led Trinidad to become by the middle of the 19th century Cuba's fifth city, with more than 14,000 inhabitants. But it did not recover from the civil war and the shift of the sugar industry to other areas Its traditional architecture makes it one of the most interesting tourist centres in Cuba.

TRINIDAD, a city of southern Colorado, U S., on Purgatory river, at an altitude of 5,963 ft., 14 mi from the New Mexico line; the county seat of Las Animas county. It is on federal highways 85, 87 and 350, and is served by the Colorado Southern, the Colorado and Wyoming, the Denver and Rio Grande Western and the Santa Fe railways The population was 12 206 in 1950 and 13,223 in 1940. It is in the midst of beautiful mountain scenery and picturesque canyons, with Fisher's peak (9,586 ft.), the highest in the Raton range, 5 mi to the south The city is a shipping point for livestock and for the large quantities of coal (1,500,000 tons annually) mined in the vicinity.

Trinidad was incorporated as a town in 1876 and as a city in 1879. In the early days it was a frequent resort of the scout "Kit" Carson.

TRINIDAD, the most southerly and, next to Jamaica, the largest of the British West Indian islands Politically, Trinidad and Tobago (*q.v.*) constitute a single colony. Trinidad is 16 mi. E of the coast of Venezuela, between 10° 3′ and 10° 50′ N and 60° 55′ and 61° 56′ W. Average length, 50 mi ; breadth, 37 mi.; area, 1,863 sq.mi Geographically and biologically it is a part of South America, from which it is separated by the Gulf of Paria. Off the northwest coast of Trinidad lie several islands, of which Chacachacare, Huevos, Monos and Gaspar Grande are the most important; Patos, westernmost of the islands, was ceded to Venezuela in 1942 Under its "destroyer bases" agreement with Great Britain in 1940, the United States acquired 99-year lease rights for naval and air bases in Trinidad Several areas were taken over and occupied beginning in 1941, but by 1950 all of these had been relinquished except the naval base at Chaguaramas, although the United States retained full rights to re-establish bases in the event of war or grave emergency.

Both in the north and south of Trinidad there are ranges of hills running east and west, prolongations of the Venezuelan coast ranges Of these, the northern is the more elevated, its highest point being Mt. Aripo (3,085 ft.). A small ridge runs through the centre of the island, from Manzanilla point to San Fernando, with the isolated Mt. Tamana (1,010 ft). All hills are densely wooded There are four mineral springs and several mud volcanoes, but the two most striking natural features are the Maracas falls and the Pitch lake. The Maracas falls, 312 ft high, are situated at the head of a valley of the same name, to the northeast of Port-of-Spain. The Pitch lake lies some 38 mi. S E. of the capital, by water, in the ward of La Brea. It is circular in form, about 3 mi in circumference, and 104 ac. in extent. The asphalt wells up in low bulging masses, separated from one another by narrow channels, in which the rain forms pools Near the centre of the lake the pitch is always liquid and can be observed bubbling up When the sun is hot the lightest footfall leaves an impression, and the pitch emits a strong odour. The soil of the surrounding district is charged with asphalt, but is very fertile, while the road to the neighbouring port of La Brea, running over a bed of asphalt, moves slowly toward the sea like a glacier. The lake is worked by a company which exports the asphalt to the United States, paying royalty to the local government. Asphalt ordinarily accounts for around 3% of all exports.

The mountain range which runs along the north coast is formed of clay slates, micaceous and talcose schists and crystalline and compact limestones, constituting the group of unknown age called the Caribbean series. The rest of the island is composed of Cretaceous, Tertiary and Quaternary strata. The Cretaceous beds rise to the surface in the centre and are flanked to north and south by later deposits. The relations of the various divisions of the Tertiary formation are still somewhat obscure, but they are grouped by J. B. Harrison into (1) Nariva and San Fernando beds = Eocene and Oligocene; (2) Naparima marls = Miocene; and (3) Moruga series = Pliocene and Pleistocene. The Naparima marls consist of a lower division containing *Globigerina* and an upper division with Radiolaria and diatoms and are clearly of deep-sea origin The bitumen of the Pliocene and Pleistocene deposits appears to have been formed by the decomposition of vegetable matter. Salses or mud volcanoes occur upon the island

Trinidad is the third largest producer of petroleum in the British Commonwealth. The first well was drilled at Aripero in 1867, but no shipments were made until 1911. In 1950 production was 20,600,000 bbl. Most of this oil was refined by the island's two refineries, which were also refining an increasing volume of crude oil from Colombia and Venezuela.

Trinidad has a rich soil well adapted to the cultivation of tropical products. For many years cacao was the most important crop, but sugar eventually supplanted it. In 1949 production rose to a new high of 159,135 tons, the previous peak having been 154,569 tons in 1936 It declined slightly to 146,508 tons in 1950 Around 23,000 tons annually is consumed locally, the remainder being exported.

Sugar and its by-products have an annual value of more than B W I $20,000,000 In 1950 the industry gave employment to 21,434 persons at season's peak, with a minimum of 15,617, compared with an average of 16,300 employed by the oil industry Coconuts are third in agricultural importance Coffee, tonka beans, citrus fruits and bananas are raised The manufacture of Angostura bitters is important

Petroleum accounts for around 75% of all export values, with sugar and sugar products following In 1950 imports reached a total of B W I $160,250,000 in value Exports were B.W.I $167,500,000, not including approximately B W I $10,000,000 of re-exports. An important ship supply trade (B.W I $19,000,000 in 1949) usually accounts for more than 15% of export values The heaviest trade is with the United Kingdom, with Canada, the United States and Brazil also important. Trinidad has a large carrying trade with neighbouring republics and is an important distributing centre for much of the West Indies.

Government accounts were kept in sterling until 1935, when the decimal system replaced it. British currency is legal tender but the official monetary unit is the British West Indian (B.W.I.) dollar, valued at B W I. $4 80 to the pound sterling.

The 1946 census showed the entire colony's population to be 557,970, a 35.2% increase in 15 years, with Trinidad itself having 530,809. In 1950 the population of Trinidad was 635,843 (official estimate). Nearly one-third of the inhabitants are of East Indian extraction, constituting the largest unit of that racial element in the western hemisphere Of the rest, the upper classes are of British, French and Spanish blood, while the lower are of Negro and mixed Negro origin, with a few Chinese. English is spoken generally, though in the north a French patois prevails and in several districts Spanish is still in use. Port-of-Spain (1950 pop., 105,744), the capital, is on the west coast. It is the leading port of the British West Indies and handles virtually all the island's external trade. Formerly, large ships had to anchor in an open roadstead because of the shallowness of the harbour proper, but in 1941 a deep-water project was completed, including a 3,700-ft. wharf wall, a 13,000-ft. entrance channel and a basin 4,000 ft. by 500 ft. A new 1,800-ton slipway was opened in 1946 In addition to the city of Port-of-Spain there are two other municipalities, both of them rated as boroughs: San Fernando (pop. 32,867), on the Gulf of Paria about 30 mi. from Port-of-Spain, and Arima (pop. 9,194), 16 mi. inland and east of Port-of-Spain.

Trinidad's seasons are regular, wet from May to January except for a short break in October, and dry from late January to mid-May. The temperature varies only slightly, with a daylight average of 84° F. and a night average of 64° F. Annual rainfall averages 64 in. at Port-of-Spain and from 50 in. to 120 in. at other points.

A government railway system of 118 mi. links Port-of-Spain with other parts of the island. There are 1,091 mi of main roads and 781 mi. of local roads. The island is served by British, Canadian, United States, Venezuelan, Dutch, Brazilian, Argen-

tine, Colombian and Spanish air lines. Between 4,000 and 5,000 ships (with a total net registered tonnage of 10,859,396 in 1950) touch annually.

The colony underwent several changes in governmental structure during the first half of the 20th century, all designed to permit greater popular participation in government affairs. Under the constitution of 1950, there is a governor (appointed by the crown) and a legislative body consisting of an executive council of 9 (5 chosen by elected members of the legislative council from among their own number) and a legislative council of 5 members appointed by the governor, 3 ex officio and 18 elected by universal suffrage.

The colony's revenues exceeded expenditures in all the post-World War II years through 1950, but in 1951 they were estimated at B.W I $52,056,050 and B W.I. $54,882,725, respectively. The public debt was B.W.I. $42,124,085 in 1950.

In 1950 a five-year economic program, calling for B.W I. $38,885,275 expenditure on public works, was launched. The largest single outlay was $14,000,000 toward completion of an island-wide water scheme which it was estimated would eventually cost $23,724,000. Other projects included highway development, slum clearance and erection of school buildings. The program's costs were to be met in part by advances from the Colonial Welfare and Development fund.

Elementary education is free, but is compulsory only in Port-of-Spain, San Fernando and San Juan. In 1950 there were 306 primary schools, 12 of them being new in the course of the year. Their total enrolment was 115,309. Most of these schools (about two-thirds) are denominational, including Moslem and Hindu, receiving government subsidies. The remainder are government operated. Fees are charged at the intermediate and secondary schools. Colleges for training teachers for elementary schools comprised government and Roman Catholic institutions at Port-of-Spain and the Naparima Training college at San Fernando. Several high schools in Trinidad, and one in Tobago, were affiliated with the Queen's Royal college at Port-of-Spain. The government awarded annually three four-year scholarships for students to proceed to universities overseas.

In 1921 the Imperial College of Tropical Agriculture was established in Trinidad, at St. Augustine, about 8 mi. E of Port-of-Spain; it was incorporated by royal charter in 1926. Its purposes are to provide training in the science and practice of tropical agriculture for students intending to become tropical planters, agricultural administrators or specialists in agricultural science and technology; it also conducts research relating to a wide range of tropical crops, and advises other British possessions in the Caribbean area with respect to agricultural problems.

Trinidad was discovered by Columbus in 1498. A Spanish governor was appointed in 1532, and before the end of the 16th century San José de Oruna (site of the modern town of St. Joseph), 7 mi. inland from Port-of-Spain, became the capital. San José de Oruna was burned by Sir Walter Raleigh in 1595, and the island was raided by the Dutch in 1640 and by the French in 1677 and 1690. Foreigners of all nations were encouraged to settle in Trinidad by advantages offered in 1783, and a large influx of people included many French families driven from Haiti and elsewhere by events of the French Revolution. In 1797, during war between Great Britain and Spain, a British expedition under Sir Ralph Abercromby sailed from Martinique to reduce the island Trinidad capitulated without a fight on Feb 18, 1797, and it was formally ceded to Great Britain by the treaty of Amiens in 1802

TRINIDAD, an uninhabited island in the South Atlantic, 680 mi. E. of the coast of Espiritо Santo, Braz., in 20° 30′ S, 29° 20′ W., 4 mi long by 2 mi. broad.

TRINITARIANS, a religious order founded in 1198 by St. John of Matha and St. Felix of Valois, for the liberation of Christian prisoners and slaves from captivity under the Moors and Saracens The two founders went to Rome and there obtained the approbation of Innocent III, 1198. The rule was the Augustinian, supplemented by regulations of an austere character. The habit was white, with a red and blue cross on the breast. The Trinitarians are canons regular, but in England they were often spoken of as friars. The first to go on the special mission of the order were two Englishmen, who in 1200 went to Morocco and returned thence to France with 186 liberated Christian captives. Vast sums of money were collected by the Trinitarians; but they were called upon, if other means failed, to offer themselves in exchange for Christian captives. Many thousands were liberated by their efforts. In the 17th century a reform called the Barefooted Trinitarians was initiated, which became a distinct order and is the only one that survives. There are now less than 500 members. Their headquarters are at San Crisogono in Rome. They devote themselves to the ransoming of negro slaves, especially children, and a great district in Somaliland has been since 1904 entrusted to them as a field for missionary work.

Bibliography.—The chief modern book on the Trinitarians is Deslandres, *L'Ordre français des Trinitaires* (2 vols., 1903). Sufficient information will be found in Max Heimbucher, *Orden u. Kongregationen* (1907), ii. §57; and in the *Catholic Encyclopaedia*, article "Trinitarians."

TRINITY. The Christian doctrine of the Trinity can be best expressed in the words "The Father is God, the Son is God, and the Holy Ghost is God, and yet they are not three Gods but one God . . . for like as we are compelled by the Christian verity to acknowledge every Person by himself (*singillatim*) to be God and Lord, so we are forbidden by the Catholic religion to say that there be three Gods or three Lords" (*Quicunque vult*). Though this doctrine was one of the first to be dealt with by modern methods of "comparative religion" (as long ago as when Gibbon wrote, "200 B.C, The Logos taught in Alexandria, A.D. 97, Revealed by St. John")—and though it is natural to ask its relation to certain triple arrangements of Pagan deities, to Jewish doctrines of "Wisdom" and the "Word," to the Hegelian triad "The Idea: Nature: Spirit"—it is probably less well adapted to this treatment than other Christian doctrines. At any rate the first step is to discover what, in using this *prima facie* paradoxical language, the Christian Church believed itself to be asserting.

Here a common misunderstanding must be cleared away. "The Creed"—it has been suggested (see *Hibbert Journal*, xxiv. No. 1) —"means that there is only one being that can, with strict theological correctness, be called 'God,' viz., the Trinity as a whole; but each of the three persons can be called 'God' in a looser sense." This suggestion is offered as a short method of "rendering consistent" the statements of the Creed But the paradox is not thus lightly to be got rid of. Plainly the Church did not regard itself as lowering the conception of the Father, so that He should become merely one Component of a Divine Whole. "The Father," says St. Thomas Aquinas, "is as great as the whole Trinity," and explains that in such matters "greatness signifies perfection of nature and pertains to essence" (*Summa Theol.* i., xxx. 1, xlii 4).

Fundamental Conceptions.—This conception of the Trinity is systematically developed by theologians, Greek, Latin and Protestant. "The whole perfection of the Divine nature is in each of the persons. The essence and dignity of the Father and the Son is the same, but is in the Father according to the relation of Giver, in the Son according to the relation of Receiver" (*S.T.* i., xlii 4). Writers in the 4th and 5th centuries had compared the relation of the Father to the Son with the relation of the "flame to its light," of the "spring to the stream," of the "seal" to its "impress." "Think," says St. Augustine (*Sermo ad Catechumenos*, sec. 8) "of fire as a father, light as a son. See: we have found coevals: and it is easy to see which begets which." The meaning of these comparisons is plain. They teach that the whole Divine nature or essence is in each of the Three Persons. The impress, for example, is a *full* reproduction of the character of the seal. They teach also that the Divine persons are inseparable. We are dealing both with a "generical" and a "numerical" unity (*cf.* Aug., *F. and S*, sec. 4; *Modern Churchman*, vol. xv. 12, 675–7; Webb, *God and Personality*, 69n).

Thus, side by side with language declaring that Father and Son are each in the full sense God, there is other language—not *intended* to be inconsistent with the former—which implies that the Son is "necessary to the completeness of the Godhead." The Son, we are told, is not "external" to the Father (Athan., *Discourse I.*, ch. v.), does not "accrue" to the Father from without, but is "of the Substance of the Father." If the Son, it is argued,

were not eternal, the Father would not always be Father, and this absence of fatherhood, it is implied, would be a defect (*cf.* the words *consortium, solitarius, S.T* i, xxxi., 2 and 3). What is the value of these speculations? They cannot be understood apart from a knowledge of the context in which they grew up. This context may be summed up in a sentence Christians, who were willing to die for Monotheism, deliberately held Jesus to be worthy of full Divine worship; and offered the phrase *Consubstantialem patri* as the intellectual justification of this attitude. In contact with the "Spirit" (who was held to speak in the heart of the individual Christian) they believed themselves to be in contact with God. In contact with Jesus as Master, they likewise found themselves in contact with God; but with no divided allegiance, since they conceived the Universe—in spite of its manifest evils—as the work of the Father of Jesus Christ, and so the embodiment of the same Holy Will which expressed itself most clearly in Jesus and in the Holy Spirit

The doctrine, then, is primarily religious; and if we define God—as in practice religion does—as "That which has an absolute claim upon our obedience" or as "the Supreme Object of our reverence," the paradoxical element in the doctrine is at least diminished. The ultimate Object of the Christian's reverence is—as reflection will show—the Christian ideal of holiness. A being who fell short of this standard, however omnipotent or self-existent he might be, would not receive the Christian's worship. Conversely, this standard would have an equal claim upon our reverence—since its claim to our obedience is conceived as being absolute—whether or not it were embodied in a person. Jesus is worshipped because the Christian "identifies" Him with His Call—His Law. Reverence and subjection to Him are reverence and subjection to it (John xiv. 21, etc) Is there, then, any insuperable difficulty in the notion of a threefold personal embodiment of the one Divine Will and Character, an embodiment so complete in each case that contact with the Divine Person is contact with God?

Claims of Unity.—The answer to the foregoing question turns upon the claims of unity. The unity of the world is sometimes represented as based upon its presence to, and its existence in, a single Divine Mind. Religion, however, is interested primarily in the unity of the moral ideal, of the ideal of perfection generally. "The Monotheism of Israel," it has been well said, "was primarily moral seriousness" Religion is concerned also with a faith—which is the basis of its trust and hope—in the necessity of the complete realization of the good in the universe as seen in God; with a faith in that "perfection of the Universe" which St. Thomas regarded as God's chief purpose in creation (i. 50, 3). A Universe which has unity as the complete realization of this single ideal, has the unity which chiefly concerns religion. This ultimate unity of subordination to a single principle is not necessarily identical with the unity which comes from being included within the mind of a single Divine Beng. Nor is it obviously identical with the theologian's "numerical unity of substance" (*see e.g.*, Tanqueray, *Syn. Theol. Dog.*, ii. 575–576). The Unity, then, of the Object of our supreme reverence and trust is not plainly inconsistent with the existence of personal distinctions (in the modern sense of the word) within the Godhead. It was probably an afterthought to regard the doctrine of the Trinity as providing a more satisfactory conception of "personality in God" than could grow up under a "unipersonal" theology. Yet Trinitarianism has some points of superiority over a theory which may compel us to conceive God as waking up at the Creation from "an eternity of idleness" (Shelley, *Queen Mab*, vii. *cf. Journal of Theol Studies*, iv. 376). Love—it may be argued—can only be at its highest perfection in the "love of God for God"—in a love in which the that loves and He that is loved are wholly adequate to one another. A faith in God's perfection would thus tend to a belief in the "plurality of persons in the Godhead"

Amplifying Conceptions.—It has been similarly argued that in conceiving the "not-self with which God contrasts Himself" as "wholly internal to His essence" while the unity (the Holy Spirit) "within which the relation of the two falls is not, as in us, a dark mystery at the back of our life but something which 'proceeds from both' " we have "the best notion that we can frame of Being at its highest" (Webb, *J T.S.*, Oct 1900) Such an argument leads not merely to a plurality but to a trinity of Divine persons, and supports the Western doctrine of the procession of the Spirit from the Father and the Son, *tanquam ab uno principio et unica spiratione* (Council of 1274) It agrees also with the conception of the mutual indwelling of the Three Persons (Tanqueray, *S.T.D.*, ii., 664–665). Again, the argument—if joined with the belief that "whatever we conceive the Divine life to be, our life cannot be outside it"—is in accordance with the Scriptural conception that mankind is within the Eternal Son, that the Church is His "body" or His "fulness." Such a conception would lead us beyond any mere "trinity of manifestation"; since it implies that, though in knowing each Person of the Trinity we are knowing God, yet to know God as Trinity is a real addition to our knowledge, and further, that the personal relations within the Trinity are necessary to His full glory, since they make possible to God something better than mere self-contemplation.

The doctrine, then, we may conclude, arose primarily from the conviction that worship of Jesus is consistent with Monotheism. But if, secondarily, the doctrine when formed is defended as offering the best attainable conception of the Divine perfection, it follows that our sense of what is good and fitting, our aesthetic and religious instinct for perfection, and likewise those qualities in the doctrine which moved Dante (*Parad.*, x. 1–6) to give it poetic expression, are all relevant to its discussion. (*See* PANTHEISM, ATHEISM)

TRINITY HOUSE, CORPORATION OF. A fraternity of seamen connected from early times with the river Thames and described in the charter of incorporation granted in the name of the Holy Trinity by King Henry VIII on May 20, 1514, as the Shipmen of Mariners of England. Its present charter, granted by King James II on July 8, 1685, describes it as the "Guild, Fraternity, or Brotherhood of the Most Glorious and Undivided Trinity and of St. Clement in the Parish of Deptford Stronde in the County of Kent." The first master appointed was the founder of the corporation, Sir Thomas Spert, Controller of the Navy to King Henry VIII. Deptford having been made a royal dockyard by Henry VIII, and being the station where outgoing ships were supplied with pilots, the corporation rapidly developed By an Act of Parliament, 8. Queen Elizabeth, the corporation was granted power to erect seamarks at its own costs, and in 1594 it received the very valuable grants of ballastage in the river Thames, and the rights to erect and place beacons and buoys up to that time held by the Great Admiral of England. The charter was regranted by successive sovereigns, King James I made considerable changes and added a number of "Elder Brethren" as distinct from the remaining brethren who were designated "Younger Brethren", whose sole rights consisted of having a vote in the election of the master and wardens.

During the Commonwealth the constitution of the corporation was suspended and the work was conducted by nominees of Parliament, but on the restoration the charter was given back but subsequently surrendered to King Charles II towards the end of his reign, and a new charter was granted by King James II under which the corporation now functions.

The original home of the corporation was at Deptford, but in the seventeenth century it was moved to Water Lane, London, where it remained until 1795 when it was transferred to its House on Tower Hill where it still remains. The corporation by virtue of letters patent granted by the Crown from time to time had

erected lighthouses and established light vessels and buoys, for the maintenance of which it was empowered to collect tolls, and in 1836 Parliament passed an Act giving the corporation power to purchase from the Crown, as well as from sundry private proprietors, all their interests in certain principal coast lights. From the earliest days the maintenance of the lights, buoys, etc., was met out of the tolls levied on shipping, any surplus being devoted to the relief of old and indigent mariners and their families, but in 1853 the control of the light dues or tolls was transferred to the Board of Trade, and the corporation was left with only its private and charitable income.

The corporation is now the general lighthouse authority for England and Wales, the Channel Islands and Gibraltar; it is also the principal pilotage authority for England and Wales, and its functions in both these respects are controlled by statute. The Elder Brethren act as nautical assessors in the House of Lords, the Admiralty Division of the High Court of Justice, and the Court of Session in Scotland. Other Trinity Houses established under ancient charters exist at Hull, Newcastle and Leith.

See W. H. Mayo, *Trinity House, London, Past and Present* (1905); C. R. B. Barrett, *The Trinity House of Deptford Strond* (1893).

TRINITY SUNDAY, the Sunday next after Whitsunday. A festival in honour of the Trinity had been celebrated locally at various dates for many centuries before Pope John XXII (1316–1334) ordered its general observance on the octave of Whitsunday. From Trinity Sunday onward all Sundays until the close of the ecclesiastical year are reckoned in the Church of England as "after Trinity," in the Roman Church as "after Pentecost."

TRINOVANTES, commonly *Trinobantes*, a powerful British tribe about 50 B.C.–A.D. 50 dwelling north and northeast of London, rivals and neighbours of the Catuvellauni. When Gaius Julius Caesar invaded Britain 54 B.C. they joined him against their domestic rivals. They were conquered by Rome in A.D. 43 and joined in Boadicea's revolt in 61. In the tribal division of Roman Britain given by Ptolemy their land included Camulodunum (Colchester), but nothing more is known of them. Their name plays a part in mediaeval legends and romances. There it was interpreted as Troy Novant, the "new Troy," and connected with the names of the Trojans Brutus and Corineus who were reputed to have given their names to Britain and Cornwall.

(F. J. H)

TRIOLET, one of the fixed forms of verse invented in mediaeval France, and preserved in the practice of many modern literatures. It consists of eight short lines on two rhymes, arranged a b a a a b a b, and in French usually begins on the masculine rhyme. The first line reappears as the fourth line, and the seventh and eighth lines repeat the opening couplet; the first line, therefore, is repeated three times, and hence the name. No more typical specimen of the triolet could be found than the following, by Jacques Ranchin (*c.* 1690):—

"Le premier jour du mois de mai
Fut le plus heureux de ma vie:
Le beau dessein que je formais,
Le premier jour du mois de mai!
Je vous vis et je vous aimais.
Si ce dessein vous plut, Sylvie,
Le premier jour du mois de mai
Fut le plus heureux de ma vie."

This poem was styled by Ménage "the king of triolets." The great art of the triolet consists in using the refrain-line with such naturalness and ease that it should seem inevitable, and yet in each repetition slightly altering its meaning, or at least its relation to the rest of the poem. The triolet seems to have been invented in the 13th century. The earliest example known occurs in the *Cléomadès* of Adenès-le-Roi (1258–97). The mediaeval triolet was usually written in lines of ten syllables, and the lightness of touch in the modern specimens was unknown to these perfectly serious examples. One of the best-known is that of Jean Froissart, "Mon coeur s'ébât en odorant la rose." The rules are laid down in the *Art et Science de Rhethorique* (1493) of Henry de Croi, who quotes a triolet written in words of one syllable. According to Jean Sarasin, who introduces the triolet as a mourner in his *Pompe funèbre de Voiture*, it was Froissart who "remit en vogue" the ancient precise forms of verse, "par ses balades, ses triolets et ses rondeaux, qui par sa mort (1648) retournaient dans leur ancien décri." N. Boileau-Despreaux threw scorn upon the delicate art of these pieces, but they continued to be written in France, though not by poets of much pretension, until the middle of the 19th century, when there was a great revival of their use. There are delightful examples by Theodore de Banville.

The earliest triolets in English are those of a devotional nature composed in 1651 by Patrick Carey, a Benedictine monk at Douai, where he probably had become acquainted with what Voiture had made a fashionable French pastime. The triolet was re-introduced into English by Robert Bridges, in 1873, with his—

"When first we met, we did not guess
That Love would prove so hard a master;
Of more than common friendliness
When first we met we did not guess.
Who could foretell this sore distress,
This irretrievable disaster,
When first we met?—we did not guess
That Love would prove so hard a master."

Since then the triolet has been cultivated very widely in English, most successfully by Austin Dobson, whose "Rose kissed me today," "I intended an Ode" and "In the School of Coquettes" are masterpieces of ingenuity and easy grace.

In French literature, triolets are innumerable; perhaps the most graceful cycle of them is "Les Prunes," attached by Alphonse Daudet to his *Les Amoureuses* in 1858. In Germany the triolet has attracted much attention. Those which had been written before his day were collected by Friedrich Rassmann in 1815 and 1817. But as early as 1795 an anthology of triolets had been published at Halberstadt and another at Brunswick in 1796 Rassmann distinguished three species of triolet: the legitimate form (which has been described above), the loose triolet, which only approximately abides by the rules as to number of rhymes and lines and single-strophe poems which more or less accidentally approach the true triolet in character. The true triolet was employed by W. Schlegel, F. Hagedorn, F. Ruckert, A. Platen and other romantic poets of the early 19th century. In many languages the triolet has come into frequent use to give point and brightness to a brief stroke of satire; the French newspapers are full of examples of this. The triolet has laboured under a suspicion of frivolity, but in the hands of a genuine poet the form possesses a delicate charm.

TRIPHENYLMETHANE, a hydrocarbon, $(C_6H_5)_3CH$, which gives its name to an important group of synthetic colouring matters which includes magenta, paramagenta (rosanilines), malachite green, brilliant green, patent blue, aurin and rosolic acid. (*See* Dyes, Synthetic.) It is a white crystalline solid melting at 92° C. and boiling at 358° C./760 mm. Its preparation is best effected by adding anhydrous aluminum chloride to a mixture of dry benzene and dry carbon tetrachloride; after 24 hours anhydrous ether is slowly added; and, after a further 24 hours, the mixture is treated with acidified ice water. The hydrocarbon is extracted with benzene and obtained from this extract by a distillation under reduced pressure, being purified by crystallization from ethyl alcohol (O. Kamm and J. F. Norris, *Organic Syntheses*, vol. iv, J. Wiley and Sons, 1925). Other modes of formation are as follows: (1) condensation of benzal (benzylidene) chloride, $C_6H_5CHCl_2$, with mercury diphenyl; (2) condensation of benzene with chloroform in presence of aluminum chloride; (3) from paramagenta (pararosaniline chloride) by successive reduction, diazotization and replacement of diazo-groups by hydrogen. The third process is of historical interest as it served to establish the connection between the hydrocarbon and the rosaniline colouring matters (O. and E. Fischer, 1881). Conversely, triphenylmethane can be nitrated and its trinitro-compound can be reduced to paraleucaniline, $CH(C_6H_4.NH_2)_3$, which on oxidation in acid solution yields pararosaniline chloride or paramagenta, $(NH_2.C_6H_4)_2C:C_6H_4:NH_2Cl$. Triphenylmethane on oxidation is found to give triphenylcarbinol, $(C_6H_5)_3C.OH$, a feebly basic hydroxide which on treatment with hydrogen chloride is converted into colourless triphenylmethyl chloride, $(C_6H_5)_3C.Cl$,

melting at 111° C. This chloride is the primary product of the foregoing condensation of benzene and carbon tetrachloride (*v. supra*). (G. T. M.)

TRIPOD, in classical antiquities, any "three-footed" utensil or article of furniture. The name is specially applied to: (1) a seat or table with three legs; (2) a stand for a cauldron in cooking, or for a camera, compass, theodolite, etc; (3) a sacrificial tripod or altar, the most famous of which was the Delphic tripod, on which the Pythian priestess took her seat to deliver the oracles of the god, the seat being formed by a circular slab on the top, on which a branch of laurel was deposited when it was unoccupied by the priestess. Another well-known tripod was the "Plataean," made from a tenth part of the spoils taken from the Persian army after the battle of Plataea. This consisted of a golden basin, supported by a bronze serpent with three heads (or three serpents intertwined), with a list of the states that had taken part in the war inscribed on the coils of the serpent. The golden bowl was carried off by the Phocians during the Sacred War; the stand was removed by the emperor Constantine to Constantinople, where it is still to be seen in the Atmeidan (hippodrome), but in a damaged condition, the heads of the serpents having disappeared. Tripods are frequently mentioned in Homer as prizes in athletic games and as complimentary gifts, and in later times, highly decorated and bearing inscriptions, they served the same purpose.

ROMAN BRONZE TRIPOD IN MUSEUM AT NAPLES

TRIPOLI, a city in Lebanon and the seat of administration of the sanjak of North Lebanon in French mandated territory until 1941, mod. *Tarabulus*. It is situated about 2 mi. inland from its port, El-Mina, to which it is joined by a tramway. Pop. (1943) 70,800. The city is the terminal of railroads connecting with Turkey and Egypt, has a modern port for seaplanes and is the terminal of one of the two pipe lines of Mosul oil. The chief industries are soap manufacture, sponge fishing, tobacco cultivation and fruitgrowing. It has an export trade in fruit (especially oranges), eggs and cotton.

History.—Tripoli is known only by its Greek name. Founded after 700 B.C, it became in the Persian period the capital for the Phoenician triple federation—Sidon, Tyre and Aradus. Each of the three had its own district in the "triple town," which at that time stood on the El-Mina peninsula. The Seleucids and Romans extended and embellished the city. The Moslems took possession in A.D. 638. In 1109 it surrendered to Raymund of St. Gilles, after a five-year siege. A great library founded by 'Ammar, the ruling family, and consisting, it is said, of 100,000 volumes, was consigned to the flames. When Sultan Kala'un of Egypt took the town in 1289 it was destroyed, and a new city arose on the present site. Tripoli was often a disputed possession of the rival princes of Aleppo and Acre. In 1834, during the Egyptian conquest of Syria, it was made a centre of administration. The British occupied it Oct. 13, 1918. It was incorporated in the state of Grand Liban on Aug. 31, 1920. In 1941 it was occupied by the British and Fighting French and became part of the independent republic of Lebanon on Nov. 26 of that year. (E. Ro.; X.)

TRIPOLI, the ancient Oea, capital and major urban settlement of Tripolitania, Libya. Prior to the establishment of an independent Libya it was under British military administration (from 1942), and before that served as capital of the Italian colony (1911) and province (1939) of Tripolitania, and the Turkish vilayet (1835) of Tripoli. It is situated on the North African coast at 32° 53′ 40″ N. and 13° 11′ 32″ E. on a promontory stretching out into the Mediterranean and forming a small crescent-shaped bay which shelters the harbour from the north winds. Including the 35,000 natives of the adjacent oasis, the population was about 108,000 (40,000 Italians) in 1938; 119,000 (est.), 1951. The crenellated enceinte walls by which the city was surrounded had the form of an irregular pentagon, but have now been, to a considerable extent, demolished They dated from Roman times, but the earliest portions actually preserved belonged to the Byzantine period, and the greater part to the 16th century. The citadel, dating from the time of the Spanish occupation, now serves as the residence of the governor, and there also is the archaeological museum The desert almost touches the western side of the city, while on the east is the verdant oasis of Mechia, where are still to be seen the tombs of the Karamanlian sultanas. The aspect of the city is picturesque, the houses (many possessing beautiful gardens) rise in terraces from the seashore. The Turkish quarter contains numerous mosques whose minarets and cupolas break the monotony of the flat-roofed and whitewashed houses. The Pasha mosque (originally a church built by the Spaniards) has an octagonal minaret, but the most beautiful is the Gurgi mosque (1833). Many of the streets are arcaded. Near the port stands a Roman triumphal arch, quadrifrontal in form, made entirely of white marble and richly embellished with sculpture. It was erected in A.D. 163.

The modern part of the city, to the southwest of the old town, contains a number of official buildings, a cathedral, the Victory monument, theatres, hotels, etc., most of them along the fine sea front called Lungomare Conte Volpi, in honour of the former governor (1921–25). There is also a large tobacco factory, productive salt works and breweries using barley grown locally and in Cyrenaica. In the 1920s harbour works of considerable magnitude were undertaken and Tripoli was made one of the most modern ports on the Mediterranean. Regular communications with Italy by sea and air were established as well as colonial coastwise shipping routes both west and east. Tripoli also became the focus of the few rail lines and the growing road system, planned to unite more completely the parts of Libya. Military buildings, artillery factories, supply bases, hangars and a hospital were also constructed at the port. Tripoli thus became the major base for German-Italian operations in the North African campaign of World War II. On Jan. 23, 1943, the city fell to the British.

The oasis of Tripoli is very fertile and beautiful; its total surface is about 25 sq.mi., and it contains about 4,000 houses, 8,500 wells and 1,000,000 trees At Sidi Mezri there is an important governmental agricultural experimental station.

The ancient Oea (one of the cemeteries of which has been discovered) was probably founded by Phoenicians from Sicily. It became a Roman colony after the fall of Carthage. It owed its importance in the middle ages and subsequently to the destruction of Sabratha and Leptis by the Arab invasion in the 11th century. In 1510 Tripoli was taken by Pedro Navarro; in 1530 it was granted to the Knights of St. John; but in 1551 it was lost again, and attempts to retake it, organized by Philip II of Spain and led by Andrea Doria, came to nothing, the expedition being defeated at Jerba. It subsequently became a nest of pirates, stamped out by U.S. naval action in 1801–05. (H. M. Kt.; H. V. B. K.)

TRIPOLI is a porous, friable, microcrystalline silica rock of sedimentary origin comprised chiefly of chalcedony and microcrystalline quartz. It does not include diatomite, although the name was chosen because of its superficial resemblance to tripolite, a diatomite from Tripolitania in North Africa. Some tripoli is a coherent residuum from leached limestone, dolomite or chert; other is probably leached, flocculated colloidal silica which has partly recrystallized. The friable variety is more typical. The chemical composition is usually more than 95% SiO_2, but the impurities may impart beneficial, desirable physical properties instead of being deleterious. Tripoli is used mainly as a polishing or buffing abrasive, wherein it excels because of its physical properties (particle shape and porosity), and also as a parting powder between moulding sand Commercial tripoli powder is finely pulverized, much of it being reduced below ten microns in diameter. Production in the U.S. is chiefly from Missouri and Illinois, less from Arkansas, Georgia and the Tennessee valley. Besides domestic consumption, large exports go to England chiefly and to other European, Asiatic and South American countries.

(W. D. Kr.)

TRIPOLITANIA, the western part of the kingdom of Libya, has an area of about 348,000 sq.mi. (only 96,472 if the desert

hinterland of the Fezzan be excluded) and is bounded on the east by Cyrenaica, on the north by the Mediterranean sea, on the west by Tunisia and, beyond the Fezzan, by Algeria and on the south, likewise beyond the Fezzan, by French West Africa and by French Equatorial Africa The population in 1951 was estimated as follows. Moslems 753,240; Italians 46,838; Jews 8,000; others, mainly Maltese and Greeks, 3,800; total 811,878. The chief towns, both coastal, are Tripoli (*q v.*; pop., 1951 est., 119,000) and Misurata (pop, 1951 est., 48,000).

Physical Features.—Tripolitania is essentially an undulating plateau, forming a northern part of the central Sahara desert. The surface rises generally southward, where, at the extreme southern frontier, it merges into the Ahaggar, Timmu and Tibesti uplands of the central Sahara. In the northeast, between Misurata and the Gulf of Sirte, the land rises gradually from sea level without much discontinuity; but westward there is first a coastal plain, known as the Jefara, that is backed to the south by a line of northward-facing scarps, successively from east to west the Jabal Misurata, Jabal Tahuna, Jabal Garian and Jabal Nefusa. This latter feature, formed by subsidence along fracture lines trending from east to west with downthrow to the north, is often referred to simply as the Jabal It does not run parallel to the coast but strikes inland from the coast due westward between Misurata and Homs (Khums), giving the Jefara a triangular shape, with its broadest part in the west.

The Jabal reaches a general elevation of 2,000 ft. and is marked in places by outpourings of lava (*e.g.*, at Takut, due south of Tripoli). Beyond the crest of the Jabal lies the Hammada al-Hamra (Red desert), a stony plateau about 1,700 ft. above sea level, that covers 40,000 sq.mi. The Hammada is uninhabited, but the presence of numerous well-developed and now dry river valleys indicates that climatic conditions were once very different. There are a few ridges running east-west, the most imposing being the Jabal as-Suda (Black mountain), about 1,000 ft. higher than the plateau. About 400 mi. S. of the Mediterranean coast, the Hammada gives place abruptly to a series of depressions aligned east-west, which form the basin of the Fezzan. There water can be tapped at three distinct levels below ground—at 20 ft., 70 ft. and 700 ft.—and settlements occur in three main districts, Murzuk (the capital), Gatrun (south) and Sebha-Ubari (north). Away from these oases, there is the same alternation of seas of soft sand, gravel desert and volcanic masses. Two isolated oases lie in the extreme west of Tripolitania. Ghadames, an ancient centre 350 mi. S W. of Tripoli; and Ghat, a much newer settlement 250 mi S.W. of Murzuk. Both centres command trade routes skirting the main Hammada on the west and continuing southward between the Ahaggar and Timmu ranges toward the Niger and Lake Chad. For several decades previous to 1920 the only caravan routes from the Niger to Tripoli used the track via Ghat, disturbances in Bornu and the Tuareg country farther east having closed all others. The importance of both places has greatly declined.

Because of its open topography, with few screening hills, Tripolitania is affected by unmodified influences alternately from the Mediterranean and from the Sahara. Hence the climate is somewhat unstable, with rapid changes in temperature and unreliable, sporadic rainfall. Temperatures are generally high, with modification caused by the sea near the coast and by altitude in the Jabal. Day maxima in summer frequently exceed 100° F. or even 110° inland. Typical mean conditions for the different regions are: coldest month 54° F. (coast), 52° (Jefara), 47° (Jabal) and 51° (Hammada); warmest month 80° F. (coast), 86° (Jefara), 81° (Jabal) and 84° (Hammada). In summer, the whole of Tripolitania falls under the influence of the Azores anticyclone, and there is no appreciable rainfall. In winter, the northern half of the country is affected from time to time by small depressions that move eastward over the Mediterranean sea; but the northward-jutting promontory of Tunisia shelters Tripolitania from the main rain-bearing northwesterly winds, so that most of the country has only eight inches or less of annual rainfall. The Tripoli area and the Jabal lying to the south and east may receive 10 in. to 15 in. Figures of average rainfall can, however, be misleading, as rain may be entirely restricted to a few weeks, or even days, in each year. Severe droughts occur roughly at ten-year intervals, with, at times, successive seasons of drought. A special feature is the *ghibli*, a violent dusty wind from the south that can suddenly raise temperatures to more than 105° F. and cause enormous damage to growing crops.

The flora of Tripolitania is mainly Saharan, with the date palm and tamarisk highly characteristic. Acacia, asphodel, sapanwood and mastic are found in the wadies, and wormwood forms clusters in the Hammada. Near the coast laurel, myrtle, oak and other evergreens are common, with rarer patches of cypress, pine and carob. Among the commoner animals are the hare, rabbit, hyena, fox, jackal and marmot, while reptiles include the horned viper and gecko. Birds include the vulture, hoopoe, wood pigeon and dove. (W. B. Fr.)

History.—Tripolitania, also commonly called Tripoli simply, was originally a Phoenician colony. The wars between the Libyans and the ancient Egyptians do not come properly into its history. (*See* EGYPT.) Before the colonization of the neighbouring territory to the east by the Greeks (*see* CYRENAICA) the Phoenicians appear to have founded the cities of Sabratha, Oea and Leptis Oea, which stood between the other cities, became the capital of the country and was named Tripolis (the "Three Cities"). These towns commanded the trade of the central Sudan, and caravans regularly crossed the Sahara, there at its narrowest. The early history of Tripolitania was similar to that of Cyrenaica: Cyrenaica passed from the Greeks to the Ptolemies and from them to the Romans; Tripolitania, adjoining Carthaginian territory on its west, fell under the sway of Carthage and, following its fortunes, became eventually a Roman province.

In the 5th century A.D. both Tripolitania and Cyrenaica were conquered by the Vandals, whose power was destroyed in the 6th century by the Byzantine general Belisarius. In the middle of the 7th century North Africa was overrun by the Arabs, and Christianity gave place to Islam. From this period dates the decay of a civilization which had lasted about 1,000 years. Tripolitania became subject to the successive rulers of Tunisia. It was pillaged in 1146 by the Normans of Sicily. In 1321 the Beni Ammar established an independent dynasty, which lasted, with an interval during which two sovereigns of the Beni Mekki reigned (1354–69), until 1551, when Tripolitania was reconquered by the Tunisians. In 1510 Ferdinand the Catholic of Spain took the city of Tripoli, and in 1530 it was given to the Knights of St. John, who were expelled in 1551 by the Turkish corsairs Dragut and Sinan. Thus the country fell to the Turks, though after the death of Dragut the connection with Constantinople seems to have weakened. The Tripolitan pirates soon became the scourge of the Mediterranean; half the states of Europe seem at one time or other to have sent fleets to bombard the capital of the country, nor was piracy stopped until after the French occupation of Algiers in 1830. In 1714 Ahmed Pasha Karamanli achieved practical independence. He and his descendants governed the country as a regency, the claims of the Porte being recognized by the payment of tribute, or "presents."

In the early part of the 19th century the regency was twice involved in war with the United States. In May 1801 the pasha demanded from the U.S. an increase in the tribute ($83,000) which the government had paid since 1796 for the protection of its commerce from piracy. The demand was refused and a naval force was sent from the U.S. to blockade Tripoli. The war dragged on for four years, and the Americans in 1803 lost the frigate "Philadelphia," Capt. William Bainbridge and the whole crew being made prisoners. The expedition undertaken by William Eaton (*q.v.*) had the object of enthroning an exiled pasha, elder brother of the reigning sovereign, who had promised to accede to all the wishes of the United States. Eaton, at the head of a motley assembly of 500 men, marched across the desert from Alexandria and with the aid of U.S. ships took Derna. Soon afterward (June 3, 1805) peace was concluded, the reigning pasha relinquishing his demands but receiving $60,000 (about £12,000) as ransom for the "Philadelphia" prisoners. In 1815, in consequence of further outrages, Captains Bainbridge and Stephen Decatur again visited Tripoli with a squadron and forced the pasha to

comply with the U.S. demands.

In 1835 the Turks took advantage of a civil war to reassert their direct authority. They administered the country as an ordinary vilayet (province) under a pasha. Turkish rule was marked by occasional, spasmodic and mainly ineffective efforts to develop the country. When in 1881 the French seized Tunisia the Turks were alarmed and greatly strengthened their garrison in Tripolitania. Disputes followed as to the extent of the Tripolitanian hinterland, which the French endeavoured to circumscribe. It was not only the French that the Turks had to fear: Italy had looked upon Tunisia as its heritage and, baulked in that direction, now fixed its eyes upon Tripolitania and Cyrenaica; and understandings were reached with other European powers interested. For another generation, however, the Turks remained undisturbed and under the impetus of the pan-Islamic movement penetrated farther south, a Turkish garrison even occupying the oasis of Bilma in 1910. Meanwhile Germany was making endeavours to secure economic and, as a result, political predominance in both Tripolitania and Cyrenaica. This led to action by Italy; war was declared upon Turkey in Nov. 1911 and both Tripolitania and Cyrenaica were declared to be under the full sovereignty of Italy. (For the war *see* ITALO-TURKISH WAR.) However, when the first treaty of Lausanne was signed in Oct. 1912 the Italians held only the coastal region and they met with considerable opposition from the natives (Berbers and Arabs) in their occupation of the interior. But by Aug. 1914 every place of importance in the vilayet, including Fezzan, was in Italian hands. Meanwhile in the coastal districts the Italians had with great energy begun a big program of public works, while toward the Arabs and Berbers they adopted a policy of confidence and trust.

In Cyrenaica the war continued, the Turks having incited the Senussites to continue the struggle. (*See* SENUSSI.) In Sept. 1914 the Fezzani, many of whom adhered to the Senussite sect, rose in revolt. Turkish, German and Senussi propaganda was very active throughout Tripolitania, and the declaration of war by Italy upon Austria (May 28, 1915) was the signal for a general rising. After some hesitation the Italians, in view of the situation in Europe, abandoned the whole country, with the exception of the seaports of Tripoli and Homs. Another seaport, Zuwara, was reoccupied in Aug. 1916. Meanwhile a brother of the Senussi chief ruled in Fezzan; Sulaiman al-Baruni, a Berber chieftain who had given much trouble in 1912–13, reappeared (Sept. 1916) with a firman from the sultan of Turkey appointing him governor general of the vilayets of Tripoli, Tunis and Algiers; and Ramadan ash-Shitawi, another powerful chieftain, established a so-called republic of Tripoli and ruled at Misurata, which place became a German submarine base. There was, however, little cohesion and much jealousy among the opponents of Italy.

A campaign under the direction of the governor, Count Giuseppe Volpi, during 1922–23 restored Italian authority as far east as Misurata. It was extended southward to the Hammada al-Hamra in 1924, eastward over the Sirte desert in 1928 and southward again over the Fezzan in 1929–30. In Jan. 1935 the French government under Pierre Laval ceded to Italy a strip of territory 700 m. long and 40–90 mi. broad along the northern margin of the Tibesti massif. On Jan. 1, 1934, Tripolitania and Cyrenaica had been united to form the colony of Libya, and this was incorporated into the metropolitan kingdom of Italy on Jan. 9, 1939.

The Italian population of Tripolitania rose from 18,000 in 1921 to 90,000 in 1940, nearly half of these living in the capital while large agricultural colonies were settled in the comparatively fertile coastal area.

With the expulsion of the axis forces from North Africa in the spring of 1943, Tripolitania came under British military administration with local Arab and Italian councils, while the southern Fezzan oases had been occupied by the Free French and remained under French administration. The political situation was more complex than in Cyrenaica because of the large Italian minority and also because the Moslem population was less united in its views, since only a minority of Tripolitanian Moslems belonged to the Senussite sect. However, on Nov. 21, 1949, the United Nations general assembly decided that Tripolitania should form part of an independent and sovereign state of Libya. Accordingly, the British and French, who had progressively transferred authority to the embryo state, completed the transfer on Dec. 24, 1951, when the emir Mohammed Idris el-Mahdi es-Senussi became King Idris I of Libya. (*See* LIBYA.)

See Gordon Casserly, *Tripolitana* (London, 1943); Lord Rennell of Rodd, *British Military Administration in Africa, 1941–47* (London, 1948) (F. R. C., G. E. K.)

Economic Conditions.—Agriculture occupies at least 80% of the population, but, because of severe environmental limitations, production is low. It is estimated that only 11% of the land is potentially productive. Four-fifths of this productive land is fit only for grazing, and of the remaining fifth only 960,000 ac are used for static agriculture, 3,950,000 ac. being partly unused, partly occupied by shifting agriculture. Barley is the chief crop, being best suited to the severe conditions (average annual production under British administration, 66,000 metric tons), and there is some wheat (7,000 tons annually) and millet. There are 3,500,000 olive trees (yielding 9,000 tons of oil in 1951), of which 2,500,000 were planted by the Italians. Dates are important, forming a staple food in the southern oases, but quality is much inferior to that of Tunisian dates. There would seem to be about 1,500,000 palms in the north and as many as 10,000,000 in the Fezzan, giving an annual production of at least 30,000 metric tons. The Italians planted 300,000 citrus trees, and 80% more were planted after 1945; quality is high, and the export of oranges and tangerines had met with some success by the end of 1951. Other crops are almonds (1,800,000 trees and 2,000 tons in 1951), figs, peaches, apricots, peanuts, castor beans, henna, tobacco, vegetables and vines. There were 20,000,000 vines (mostly Italian-owned) in 1951, yielding more than 660,000 gal of wine annually. Animal husbandry is of great importance, and in 1950 livestock numbers were sheep 305,000, goats 324,000, camels 63,000, donkeys 33,000, cattle 31,000, horses 5,400. Industrial activities are small, many being carried on as local crafts. The main activity consists in the processing of agricultural and fishing products; olive- and castor-oil pressing, the canning of tunny and sardines, brewing and macaroni making. Textiles are mainly produced at home, but there are a few carpet and weaving factories in Tripoli and Misurata. Other activities are the collection of esparto grass, which grows wild in the Jabal and Jefara (18,000 tons in 1950; value £120,000), and fishing for tunny, sardines and sponges (1,500 tons of fish and 25 tons of sponges in 1950). Total exports in 1950 amounted to £2,350,000, imports to £4,600,000. An annual budgetary deficit was met by grants-in-aid from the British government during the period of British administration.

Development under the Italians.—The Fascist government (*see History*, above) spent about £20,000,000 in developing Tripolitanian agriculture. Two main types of farming grew up, concessions, which were moderately large farms financed by private firms; and demographic settlements organized on a communal basis. The concessions were a kind of small plantation, employing much Arab labour, the communal settlements were planned and subsidized by the state, and occupants (Italian immigrants) worked first as semilabourers and then as part owners and were finally to become full owners (after about 20 years) on liquidation of debt charges. No Arabs were employed. In 1949 there were still 7,400 Italians living in private concessions (covering an area of 314,000 ac.) and 11,000 in public settlements (240,000 ac.). Thus 60% of the land under static farming was in Italian hands when Tripolitania was incorporated into the predominantly Arab-Berber kingdom of Libya. The concessions were approximately self-supporting, but the settlements had depended on state subsidies.

Railways comprise 122 mi. of narrow-gauge line centred on Tripoli.

TRIPOLITSA, officially TRIPOLIS, a town of Greece, capital of the nomarchy of Arcadia, 22 mi. S.W. of Argos. The name refers to the three ancient cities of Mantineia, Pallantium and Tegea, of which Tripolitsa is the modern representative. It does not stand on any ancient site. Before the War of Independence it was the capital of the Morea and the seat of a pasha, with about 20,000 inhabitants; but in 1821 it was sacked by the insurgents, and in 1825 its ruin was completed by Ibrahim Pasha. The town was later rebuilt; German troops captured it in April 1941. Pop. (1951 census) 17,585.

TRIPOLYE (KOMSOMOLYE), a town of the Ukrainian Soviet Socialist Republic, U.S.S.R., on the Dnieper river, 35 mi. south of Kiev, with which it has steamer communication. It is famous for its painted pottery of late Neolithic date; its site and others near by were explored by Chwojka and the name

Tripolye was given to the culture there represented This highly developed civilization probably dates from about 2750 B.C. Two types of pottery have been discovered, Tripolye A the grooved type, being the more common. Tripolye B, or painted pottery, is thought to be an imported product and both are considered to be contemporary Tripolye is mentioned in 1093 and later was inhabited by refugees from Kiev, after the capture of that city by the Mongols In the 17th century Tripolye was a fortress, and the remains of its walls still stand, as do two old churches built in the Ukrainian style. During the 1917–20 civil war it was the headquarters of the bandit chief Zeleny, who drowned 100 victims in the Dnieper. A battle ensued between the Communist Youth party (Komsomol) and the bandits and the town was re-named Komsomolye in memory of the Communist victims.

TRIPTOLEMUS, an agricultural hero of Eleusis, first priest of Demeter, and founder of the Eleusinian mysteries. His name is of doubtful meaning ("he who ploughs or toils thrice"; *i.e.*, diligently?); in some legends he is the inventor of the plough. In the best known legend (Apollodorus, i.) Triptolemus was the son of Celeus, king of Eleusis, and Metaneira. Demeter, during her search for her daughter Persephone, arrived at Eleusis in the form of an old woman. Here she was hospitably received by Celeus, and out of gratitude would have made his son Demophon immortal by anointing him with ambrosia and destroying his mortal parts by fire; but Metaneira, happening to see what was going on, screamed out and disturbed the goddess. Demophon was burnt to death, and Demeter, to console his parents, took upon herself the care of Triptolemus, instructed him in everything connected with agriculture, and presented him with a wonderful chariot, drawn by dragons, in which he travelled all over the world, spreading the knowledge of her gifts. In another account (Hyginus, *Fab.* 147) Triptolemus is the son of Eleusinus, and takes the place of Demophon in the above narrative, but does not die. In the Homeric hymn to Demeter, Triptolemus is simply one of the nobles of Eleusis, who was instructed by the goddess in her rites and ceremonies. The Attic legend represented him as one of the judges of the underworld. He is often represented in art, and formed the subject of a play (now lost) of Sophocles. His altar and threshing-floor were shown on the Rarian plain near Eleusis; hence he is sometimes called the son of Rarus.

See Preller-Robert, i., 767, and the classical dictionaries.

TRIPTYCH, a painting, carving or other decorative design, executed on three compartments or panels, so constructed that the two wings may fold on hinges over the centre-piece (Gr. τριπτυχος, three-fold). The backs of the wing-pieces are often also painted, carved or otherwise decorated. The subject of the side-pieces are usually appropriate and subsidiary to that of the centre. The triptych is most frequently designed as an altar-piece. An earlier use of the term is for a set of three wooden or ivory writing-tablets, hinged or otherwise fastened together, the central tablet being waxed on both sides for the impression of the *stilus* or writing implement, the outer tablets only on the inside. The three tablets thus formed a small book.

TRIPURA (formerly called *Hill Tippera*), a feudatory State of India, adjoining the British district of Tippera, in Bengal. Area, 4,049 sq.mi.; pop. (1941) 513,010; estimated revenue Rs. 2,971,000 (including revenue from estates in British India). Tripura comprises six parallel ranges of hills running from north to south, at an average distance of 12 m. apart. The hills, of which the highest is 3,200 ft. above sea-level, are covered for the most part with forest and bamboo jungle, while the low ground abounds with trees of various kinds, canebrakes and swamps. The forests shelter wild elephants, bison, tigers, leopards and deer. The principal crop and food staple is rice. Half the population consists of Tiparas, a tribe of Mongolian origin. The capital is Agartala (pop 1941, 17,693), where there is an Arts college.

Tripura represents the remnant of an ancient kingdom which at various times extended in the north to Kamrup and in the east to Arakan Ralph Fitch, who travelled through the country in 1585, noted that "the king of Tippara had almost continual wars with the Arakanese." The country now included in the Tippera district was conquered by the Mughals and annexed in 1733, but Tripura still remained under its own line of rulers. When the East India company obtained the *diwani* or financial administration of Bengal in 1765, they placed a Rajah on the throne, and, since 1808, each successive ruler has received investiture from the British government. The present ruler is H. H. Maharajah Manikya Bir Bikram Kishore Deb Barman Bahaden, who succeeded in 1923.

The District Magistrate of Tippera is ex-officio Political Agent for the State, and the governor of Bengal acts as Agent of the Governor-General for supervising the administration.

TRISECTRIX: *see* CURVES, SPECIAL.

TRISTAN or **TRISTRAM,** one of the most famous heroes of mediaeval romance. In the earlier versions of his story he is the son of Rivalin, a prince of north-west Britain, and Blanchefloir, sister to King Mark of Cornwall Rivalin is killed in battle, and Blanchefloir, after giving birth to a son, dies of grief. The boy is brought up as his own by Roald, or Rual, seneschal of the kingdom, who has him carefully trained in all chivalric and courtly arts. With the possible exception of Horn, Tristan is by far the most accomplished hero in the whole range of knightly romance; a finished musician, linguist and chess-player, no one can rival him in more knightly arts, in horsemanship or fencing. He has besides, the whole science of *vénerie* at his fingertips In fact, Tristan is the "Admirable Crichton" of mediaeval romance; there is nothing he cannot do, and that superlatively well—it must be regretfully admitted that he is also a most accomplished liar. Being kidnapped by pirates, Tristan is carried to Cornwall where he finds his way to the court of his uncle, King Mark, who is at first unaware of his identity, but, on learning it, joyfully accepts him as nephew and heir He defeats the Irish giant, Morholt, who comes to claim the tribute payable every third year by Cornwall, but is desperately wounded in the encounter. Set adrift in a boat, Tristan is carried by the waves to Ireland, where he is healed by the queen, sister to Morholt. Later on he returns to ask the hand of the princess Iseult for his uncle, King Mark, and, having slain a dragon which is devastating the country, succeeds in his quest. On the homeward journey Tristan and Iseult, by misadventure, drink of the love-potion prepared by the queen for her daughter and King Mark. Henceforward the two are bound to each other by an imperishable love which dares all dangers and makes light of hardships. The greater part of the romance is occupied by plot and counter-plot; Mark and the courtiers seeking to entrap the lovers, who by their wiles escape the snares laid for them. Finally, the two are discovered under circumstances which admit of no evasion, and Tristan is obliged to flee to Brittany. There, believing himself to be forgotten, he weds Iseult of the White Hand, daughter of the duke, but makes her his wife only in name. Wounded by a poisoned weapon he sends to Iseult of Ireland to come and heal him. If she accedes to his request the ship on which she embarks is to have a white sail, if she refuses, a black. Actuated by jealousy, his wife, who has discovered his secret, seeing the ship approach on which Iseult is hastening to her lover's aid, tells him that it carries a black sail. Tristan, turning his face to the wall, dies, and Iseult, arriving too late to save her lover, yields up her life in a final embrace.

Whether or not this beautiful story reposes upon a genuine historic tradition, the legend of Tristan and Iseult was one of the most popular themes of mediaeval romance; it was translated into many tongues, and the episodes are preserved in miniatures, carvings and embroideries. The earliest form of the story is still a matter of debate. Prof. Zimmer held that the main incidents were of historic origin, dating from the period of the Viking rule in Ireland. The name of Iseult's father, Gormond, is certainly Scandinavian, and she herself is noted for her golden hair; she is a northern, not a Celtic, princess The name of Tristan, on the

other hand, has been referred to the Pictish Drustan, and the story is now generally admitted to be of insular origin. Some think that the story was first told in the form of short episodic *lais*, which were later on woven into longer poems. On the other hand that distinguished scholar, M. Bédier, maintains that there was but one poem at the root of all the varying versions of the *Tristan* story, and that that work, composed in the 12th century by an unknown Anglo-Norman poet, was of such force that it determined for all time the form of the tradition. There certainly was an important *Tristan* poem, composed in the 12th century by an Anglo-Norman named Thomas, which was translated into German, English and Scandinavian. Only fragments now remain, but they are sufficient to show that the original was a work of outstanding merit. The German translation, by Gottfried von Strassburg, which seems to have followed the original closely, is a very beautiful poem and one of the classics of the middle ages.

Besides the version of Thomas we have a fragment by a certain Béroul, also an Anglo-Norman, and a German poem by Eilhart von Oberge, both of which derive from a common source. There also exists in two mss a short poem, *La Folie Tristan*, relating how Tristan, disguised as a fool, visits the court of King Mark. This poem is valuable, as, relying upon the sufficiency of his disguise, Tristan audaciously gives a *résumé* of his feats and of his relations with Iseult, in this agreeing with the version of Thomas. The "Gerbert" continuation of the *Perceval* contains the working over of a short *Tristan* poem, called by him the *Luite Tristan;* the latter part, probably a distinct poem, shows Tristan, in the disguise of a minstrel, visiting the court of Mark.

Finally, in consequence of the popularity of the cyclic version of the Arthurian romances, the original *Tristan* story was worked over in prose form, and incorporated with the final version of the Arthurian legend, where it served to swell the already unwieldy bulk of the romantic *corpus* to an impossible extent. Little of the primitive story is here preserved, and its original tragic beauty is obscured by an interminable series of "banal" adventures. It was in this form that Malory knew it. Fortunately for the present generation the genius of Richard Wagner, inspired by the text of Gottfried von Strassburg, has restored the story to its earlier form, and enshrined it in imperishable music.

Kolbing, *Die nordische und die englische Version der Tristan saga* (1877, 1888), *La Folie Tristan* (edit J. Bédier, 1907); *Tristan Menestrel*, from the *Perceval* (edit. J. Bédier and J. L. Weston, *Romania*, vol. xxxv., 1906). Gottfried's *Tristan und Isolde* has been several times published; the best editions are those of Bechstein (1890) and Golther (1889). There is an English prose rendering by J. L. Weston (*Arthurian Romances*, No. II.). A detailed analysis of the contents of the prose romance, compiled from the mss of the Paris library, was published by E. Löseth, *Le Roman en prose de Tristan* (1890). For a study of the sources see Gertrude Schoepperle, *Tristan and Isolt* (2 vols., 1890), and for a bibliography of the extensive *Tristan* literature, J. D. Bruce, *The Evolution of Arthurian Romance* (1923). (J. L. W.)

TRISTAN DA CUNHA, the general name for a group of three small volcanic islands belonging to Great Britain, situated in the south Atlantic, the summit of the largest being in 37° 5′ 50″ S., 12° 16′ 40″ W. They are midway between the Cape of Good Hope province of the Union of South Africa and South America. The islands rise from the submarine elevation which runs down the middle of the Atlantic.

Tristan, the largest and northernmost island, has an area of 16 sq.mi., is nearly circular in form, about 9 mi in diameter, and has a volcanic cone (6,760 ft.), usually capped with snow, in the centre. Precipitous cliffs, 1,000 to 2,000 ft., rise from the ocean on all sides, except the north-west, where there is an irregular plateau of about 12 sq.m., 100 ft above the sea. A stream crosses the northern end of the plateau, falling over the cliff edge in a fine cascade. The crater of the central cone contains a fresh-water lake about 150 yd. in diameter. This and other crater lakes are said never to be frozen over.

Inaccessible island, the westernmost of the group, is about 20 m. from Tristan. It is quadrilateral in form, the sides being about 2 m long, with cliffs about 1,000 ft., its highest point (1,840) is on the west. At the base of the cliffs in some places are narrow fringes of beach.

Nightingale island, the smallest and most southern of the group, is 10 m from Inaccessible island. Its area is not more than 1 sq. m. Its coasts are surrounded by low cliffs, from which there is a gentle slope up to two peaks (1,100 ft. and 960 ft. high). There are two small islets—Stoltenhoff (325 ft.) and Middle (150 ft.)—and several rocks adjacent to the coast.

The rocks of Tristan da Cunha are basalt, porphyritic basalt, dolerite, augite-andesite, palagonite, volcanic tuff and ashes. A block of gneiss in the crater indicates a continental foundation of the island. The caves in Nightingale island indicate that it has been elevated several feet. On almost all sides the islands are surrounded by a broad belt of kelp, the gigantic southern seaweed (*Macrocystis pyrifera*), through which a boat may approach the rocky shores even in stormy weather. There is no good anchorage in rough weather.

The prevailing winds are westerly. December to March is the fine season. The climate is mild and on the whole healthy, the temperature averaging 68° Fahr in summer, 55° in winter—sometimes falling to 40°. Rain is frequent; hail and snow fall occasionally on the lower grounds. The sky is usually cloudy. The islands have a cold and barren appearance. The tide rises and falls about 4 ft.

History.—The islands were discovered in 1506 by the Portuguese admiral Tristão da Cunha. Thereafter the islands (which were uninhabited) were occasionally visited by outward bound ships to the Indies. Attempts to form settlements were made by the Dutch in 1656, and by the English East India company a few years later, but the first permanent inhabitant was one Thomas Currie, who landed on the island in 1810. At this time American whalers frequented the neighbouring waters and, in the same year, an American named Lambert and a man named Williams made Tristan their home, but they were drowned while out fishing in May 1812. Currie was joined by two other men and they busied themselves in growing vegetables, wheat and oats, and in breeding pigs. Because of the fear that the islands might become a base for rescuing Napoleon from St. Helena, a temporary garrison was placed on Tristan, the group being formally annexed to Britain on Aug. 14, 1816. The following year the troops were withdrawn, and when they left, William Glass, his wife and two children and two masons were left behind, and shipwrecked mariners, coloured women from Cape Colony, and British, Dutch, Italian and Asiatic settlers have since made their home there. The settlers grew wheat (since made impossible owing to the ravages of rats), raised cattle, sheep and pigs, grew apples and peaches, and engaged in seal fishing. They had of necessity to make their settlement on the plain on the north-west of Tristan; here a number of substantial stone cottages and a church were built. It is named Edinburgh in memory of a visit in 1867 by the duke of Edinburgh. Several scientific expeditions have visited Tristan, the first being that of the "Challenger" in 1873, and the last one before outbreak of World War II being that of the Norwegian, Erling Christophersen, in 1938. In 1880 the population was 109; by 1897 the figure had fallen to 64, but by 1939 the inhabitants numbered 180. The inhabitants have declined repeated invitations to leave the island. They manage their own affairs under the direction of a headman (first appointed in 1933), who is chairman of the island council. The inhabitants are moral, without intoxicating liquors, religious, hospitable to strangers, well mannered and industrious, healthy and long-lived. The spiritual and educational welfare of the islanders is the responsibility of successive chaplains who have volunteered for the work. Life on Tristan is a hard one; the potato is the chief food, and fuel is very scarce. The men are daring sailors, and in small canvas boats of their own building voyage to Nightingale and Inaccessible islands. In 1938 the islands of Tristan da Cunha, Inaccessible, Nightingale and Gough were made dependencies of the colony of St. Helena.

Gough Island.—Gough island or Diego Alvarez lies in 40° 20′ S., 9° 44′ W., and is 220 mi. S.S.E. of Tristan da Cunha. It is of volcanic origin, is rugged and mountainous, the highest peak rising to 4,380 ft. The island is about 8 mi. long by 4 mi. broad. Pre-

cipitous cliffs, from 200 to 1,000 ft. high, characterize the coast They are divided by picturesque valleys. Streams fall over the cliffs into the sea in fine cascades. Three species of plants are found only on Gough, one of them named *Callitriche Christensens* for its finder, Lars Christensen. The island also has unique animals; it is the breeding place of the giant wandering albatross; and it is the most northerly point at which the giant petrel of the Antarctic is found. There are vast numbers of penguins and crayfish, and valuable guano deposits. It is also the home of numerous seals. Originally called Diego Alvarez, it derives its other name from a Captain Gough who visited it in 1731. It has been claimed as a British possession since the annexation of Tristan da Cunha in 1816, and with the Tristan group became a dependency of the colony of St. Helena in 1938

The island has been visited by several scientific expeditions, and on a few occasions it has harboured the crews of shipwrecked vessels. It has no permanent population.

BIBLIOGRAPHY.—D. M. Gane, *Tristan da Cunha* (1932); J. Brander, *Tristan da Cunha* (1940); E. Christophersen, *Tristan da Cunha* (1940); A. B. Crawford, *I Went to Tristan* (1941).

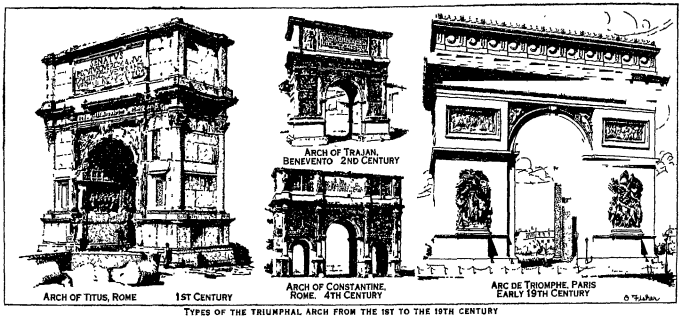
TRITON, the Greek merman, son of Poseidon and Amphitrite. According to Hesiod (*Theog.* 930), he dwelt with his parents in a golden palace in the depths of the sea. The story of the Argonauts places his home on the coast of Libya. When the Argo was driven ashore on the Lesser Syrtes the crew carried the vessel to Lake Tritonis, whence Triton, the local deity, guided them across to the Mediterranean (Apollonius Rhodius iv. 1552). He was represented as human down to the waist, with the tail of a fish, but ancient artists portray other and more fantastic seacreatures as well. His special attribute was a twisted seashell, on which he blew to calm or raise the waves Various stories (as Virgil, *Aen.*, VI., 171, Pausanias, IX., 20, 4–5) represent him as jealous or violent.

See F. R. Dressler, *Triton und die Tritonen* (Wurzen, 1892); Preller, *Griechische Mythologie* (4th ed. 1894).

TRITUBERCULATA or **PANTOTHERIA,** a group of very small insect-eating mammals from the Jurassic rocks, characterized by the sharp-cusped lower molar teeth with a posterointernal heel (tuberculo-sectorial type). Some of them, such as *Amphitherium*, are, perhaps, the ancestors of all modern mammals except the platypus and echidna (Monotremata, *q.v.*). *See* MAMMALIA; MULTITUBERCULATA; PALAEONTOLOGY.

TRIUMPH, the highest honour bestowed in Rome upon a victorious general (Lat. *triumphus*). It was only granted on certain conditions, relaxed in special cases. Only those who held the office of dictator, consul, or praetor were entitled to the distinction; the war must have been brought to a definite conclusion, resulting in an extension of the boundaries of the state; the victory must have been gained over a foreign enemy. The power of granting a triumph rested with the senate Special legislation was necessary to keep the general in possession of the *imperium* on his entry into the city. Without this, his command would expire and he would have no right to a triumph. He remained outside the city limits until the ordinance was passed; Lucullus on his return from Asia waited outside Rome three years.

The triumph, a solemn procession, starting from the Campus Martius, passed through the city to the Capitol. The streets were adorned with garlands, and the procession was greeted with shouts of *Io triumphe* At its head were the magistrates and senate, followed by trumpeters and then by the spoils, (arms, standards, statues, etc., representations of battles, and of the towns, etc., of the conquered country). Next came the victims destined for sacrifice, especially white oxen with gilded horns. They were followed by the prisoners kept to grace the triumph. The chariot of the victorious general (*triumphator*) was crowned with laurel and drawn by four horses. The general was attired like the Capitoline Jupiter in robes of purple and gold; in his right hand he held a laurel branch, in his left an ivory sceptre surmounted by an eagle Above his head the golden crown of Jupiter was held by a slave, who reminded him in the midst of his glory that he was a mortal man. Last came the soldiers shouting *Io triumphe*. On reaching the temple of Jupiter on the Capitol, the general placed the laurel branch on the lap of the image of the god, and offered the thank-offerings. A feast of the magistrates and senate concluded the ceremony. Under the empire only the emperors celebrated a triumph, because the generals commanded under the auspices of the emperors as lieutenants (*legati*); the only honour they received was the right of wearing the triumphal insignia (the robes of purple and gold and the wreath of bay leaves) on holidays The last triumph recorded is that of Diocletian (A D 302) A naval triumph was sometimes allowed for victories at sea, the earliest being that celebrated by C. Duilius for his victory over the Carthaginians in 260 B.C.



See Marquardt, *Römische Staatsverwaltung* (1884); Mommsen, *Römisches Staatsrecht* (1887); J. E Sandys, *Companion to Latin Studies* (1921).

TRIUMPHAL ARCH, originally an arch built to commemorate a victory of a Roman general, but more commonly used, in a broader sense, for any monumental arch built for purely commemorative or even decorative purposes. The term is also used for the great arch between the nave and apse or the nave and transepts of an early Christian basilica. It is probable that temporary structures spanning a road or street were built by many peoples of antiquity to celebrate the homecoming of a victorious army, but it was the Romans who first made such arches permanent monumental structures, broadened their use for general memorial purposes, and even applied them to the monumental gates of cities and towns. Obviously the building of such a structure as the developed Roman arch would occupy too much time to admit of its being used for the actual triumphal procession that it celebrated; it was, therefore, originally, probably a reconstruction in stone of an earlier, temporary archway.

Although no existing triumphal arches are earlier than the empire, it is known that there was, in the Forum, close to the regia, an arch commemorating the victory of Fabius Maximus Allobrogicus over the barbarians of Savoy in 121 B.C Augustus built a triumphal arch on the Via Sacra, commemorating the victory of Crassus over the Parthians. From that time on there was hardly an emperor who did not build a triumphal arch somewhere in Rome The greater number of these have perished, but those of Titus (completed under Domitian *c.* A.D. 80), of Septimius Severus (203–205) and that of Constantine (312), which incorporates much sculpture taken from the earlier arch of Trajan, still remain in good preservation. Many smaller monumental arches also exist in Rome. Both emperors and private citizens built them in all the important centres of the empire. Monumental gateways of triumphal arch type exist in many places in Syria, like that probably of the time of Hadrian at Palmyra, and certain city gates were given the importance of a triumphal arch, especially that of Autun, France (probably 3rd century A.D) and the Porta Nigra at Trier (4th century).

In the earlier arches, the arch is the most important element, usually with simple stretches of wall on either side. The orders appear only as minor decorative features, either under the arch impost, as at Saintes, or as flat pilasters, carrying a crowning entablature, and placed at the corners of the structure, as at S. Chamas. Only in the arches of Augustus, as at Susa and Aosta do engaged columns appear, and even then, still as minor decorative elements. It was in the arch of Titus, at Rome, that the later definite arrangement was worked out, in which the columns project boldly, on high pedestals, and carry an entablature that casts a strong shadow. Moreover, arch spandrils are sculptured, and the interior faces of the passage bear remarkable high relief panels, showing the seven branch candlestick and the other trophies of the capture of Jerusalem

In the triple arch of Septimius Severus, the attic projects out over the end columns, the inscription runs through from end to end, so that the central columns are left without apparent work to do. In the arch of Constantine, on the other hand, the free-standing columns have become, like the pilasters of the early examples, purely decorative features, and each supports a colossal statue, so that despite the crudity of much of the workmanship, this arch gives the most satisfactory effect of any

TYPES OF THE TRIUMPHAL ARCH FROM THE 1ST TO THE 19TH CENTURY

of the later arches in Rome. The Arch of Trajan at Timgad reveals another interesting attempt to relate free-standing columns to the body of an arch by connecting the two columns of each outer pair with a curved pediment, the attic over the central arch running up to a higher level. The triumphal arch of the early Christian basilica is chiefly remarkable as the position for some of the richest and most beautiful of the wall mosaics that were the chief form of interior decoration. (*See* BASILICA; BYZANTINE AND ROMANESQUE ARCHITECTURE; MOSAIC.)

There is an interesting early Renaissance triumphal arch at Naples (1453–70), to commemorate the entrance of Alphonso I into Aragon, designed by Pietro di Martino The most interesting Renaissance and modern triumphal arches are, however, of later date. The Porte Saint-Denis (1672–73), by Blondel and the Porte Saint-Martin (1674–75), by Bullet, both in Paris, depart from the Roman scheme and substitute trophies and reliefs for the orders which the Romans used. Of the more Roman type is the Arc de Triomphe du Carrousel, Paris (1805), by Percier and Fontaine, based on the arch of Septimius Severus. The Sieges Thor at Munich (1843–50), by Gaertner and Metzger, and the Marble arch in London, designed in 1828 by John Nash for an entrance to Buckingham palace and moved to its present position in 1851, are both closely imitated from the Arch of Constantine. The triple arch and screen at Hyde Park corner, London (1828), by Decimus Burton, is a freer design, but still in the Roman manner.

Another noteworthy modern arch is the Washington arch, New York city, by McKim, Mead and White, originally constructed in temporary materials in 1889 in celebration of the 100th anniversary of Washington's inauguration, later reconstructed in marble and completed 1895. By far the largest of all triumphal arches and the most beautiful of modern examples is the Arc de Triomphe de l'Étoile at Paris (begun 1805 from designs by Chalgrin, but not completed till 1836) It is remarkable for its architectural proportions and the great scale and almost stark grandeur of its sculpture, which emphasizes its great width of 147 ft. and height of 160 ft. Under the arch is the tomb of the "Unknown Warrior," over which burns the continuous "Flamme du Souvenir." (T. F. H.)

TRIVANDRUM, a city of southern India, capital of the state of Travancore-Cochin, 2 mi. from the seacoast. Pop. (1941) 128,365. It is the residence of the maharaja, and contains an observatory, a museum and zoological gardens Its chief fame centres upon an old temple in the fort, a great resort of pilgrims, round which the city grew up. The city contains the maharaja's law college, a Sanskrit college, a woman's college, technical and training schools and a hospital and medical school

TRIVIUM, in mediaeval educational systems, the curriculum which included grammar, rhetoric and logic (Lat for crossroad, *i.e.*, where three roads meet, from *tres*, three, and *via*, road). The trivium and the quadrivium (arithmetic, music, geometry and astronomy) together made up as the seven liberal arts

TRNAVA, a town in Slovakia, on the river Trnava, was transferred from Hungary to Czechoslovakia by the treaty of Trianon, 1920. It is a market town for a rich agricultural region. Manufactures include sugar refining, starch, beer, shoes and, oldest of all, cloth, fertilizers are also prepared. Pop (1930), 23,971

TRNOVO [TIRNOVO], a city and capital of a department in Bulgaria; 124 mi. E.N E of Sofia, on the Yantra river, on the Trans-Balkan railway, which joins the Sofia-Varna line at Gorna-Orehovitsa, 8 mi. N. of Trnovo. Pop. (1934) 14,100. The city is remarkably situated. The Yantra runs in a deep gorge, doubling first left, then right, round two promontories which stand like high fortresses, surrounded by water on three sides The first of these, the Tsarevitsa, is connected with the rest of the town by a high causeway, in part a bridge; the other, the Trapesitsa, is entirely isolated. The inhabited town covers the two sides of the rooflike ridge which terminates in the Tsarevitsa. On the latter are a ruined tower, known as Baldwin's tower, where the Frank emperor is supposed to have been imprisoned, and, behind it, the somewhat unimposing remains of the palace of the Asens (*q.v.*). Few of these ruins have been excavated The Trapesitsa contains the fragments of several mediaeval churches in the Byzantine style

Trnovo is believed to have been a Roman fortress, it was the birthplace of Tsar Sisman, and the home of the second Bulgar empire, proclaimed there in 1185 by the brothers Peter and Ivan Asen, who were boyars of the Tsarevitsa and Trapesitsa. It was capital of Bulgaria 1186–1394, when it was adorned with great splendour; most of the relics were destroyed in the earthquake of 1911. It was the seat of the Bulgarian patriarchate from 1232 to its abolition in 1767. Trnovo was taken by the Turks on July 17, 1394. It remained, however, a commercial centre It was captured by Russia in 1877. Prince Alexander of Battenberg was there proclaimed Bulgarian prince (1879). There the Bulgarian constituent assembly sat and the independent kingdom of Bulgaria was proclaimed in the Church of the Forty Martyrs (Oct. 5, 1908) (*see* BULGARIA: *History*). (C. A. M.)

TROAD: *see* TROY AND TROAD.

TROCHEE or CHOREE, literally the "running" or "dancing" foot (– ⏑) (Gr. τρέχειν, to run, and χορός, a band of dancers). Trochaic metre is of several kinds, usually described by the number of *metra*, or groups of two trochees, which they contain,

as the dimeter:

Rōma Rōma, | cernĕ quantă
Comrades, leave mĕ | here a little

consisting of two *metra* or four trochees. The commonest form, especially in ancient drama, is the *tetrameter catalectic* or *septenarius* (four *metra* or eight trochees, lacking the final syllable), as

Rōmă Rōma, | cernĕ quantă | sit dĕum benignĭtas
Comrades, leave mĕ | here a little, | while as yet 'tis | early morn.

TROCHOPHORE or **TROCHOSPHERE,** the names applied to the free-swimming larval form of the segmented worms or Annelida (*q.v.*) and to the very similar (first) larval stage of the Lamellibranchia (bivalves) and Gastropoda (univalves) (*qq.v.*) among the Mollusca (*q.v.*).

TROCHU, LOUIS JULES (1815–1896), French general, was born at Palais (Belle-Ile-en-Mer) on March 12, 1815. He served as a captain in Algeria and as a colonel throughout the Crimean campaign. He commanded a division in the Italian campaign of 1859. In 1866 he was employed at the ministry of war in the preparation of army reorganization schemes, and he published anonymously in the following year *L'Armée française en 1867*, a work inspired with Orleanist sentiment, which brought him into bad odour at court. He left the war office on half-pay, and was refused a command in the field at the outbreak of the Franco-German War. After the earlier disasters in 1870, he was appointed by the emperor first commandant of the troops of Châlons camp, and soon afterwards (Aug. 17) governor of Paris and commander-in-chief of all the forces destined for the defence of the capital, including some 120,000 regular troops, 80,000 mobiles, and 330,000 National Guards. He put Paris in a state of defence, and showed himself a master of the passive defensive. At the revolution of Sept. 4, he became president of the government of national defence. His "plan" for defending the city failed; the successive sorties were unsuccessful, and when capitulation became inevitable he resigned the governorship of Paris on Jan. 22, 1871 to General Vinoy, retaining the presidency of the government until after the armistice in February. He was elected to the National Assembly by eight departments, and sat for Morbihan. In July 1872 he retired from political life, and in 1873 from the army. He published in 1873 *Pour la vérité et pour la justice*, in justification of the government of national defence, and in 1879 *L'Armée française en 1879, par un officier en retraite.* He died at Tours on Oct. 7, 1896.

TROELSTRA, PIETER JELLES (1860–1930), Dutch Socialist leader, was born at Leeuwarden and educated for the legal profession at the University of Groningen, but early abandoned it for politics and journalism. He adopted Socialist opinions and becoming dissatisfied with the leadership of Domela Nieurenhuis, under whom Dutch Socialism had assumed an extremist complexion bordering on anarchism, he founded the Social Democratic Workers' Party in 1894 for the constitutional achievement of Socialism. In 1913, the Liberal party offered the Socialists three seats in a government which would include in its programme universal suffrage and old age pensions. This Troelstra refused, on the assumption that the entrance of the Socialists into the government would strengthen the opposition to universal suffrage. His point of view was approved by the conference of the party. At the elections of 1918, as a result of the introduction of universal suffrage, the Socialists scored important gains, and their parliamentary influence on the German revolution. There followed a remarkable speech in the Chamber, called upon the government to treat with a view to the formation of a new state. The leading members of his party regarded Troelstra's pressure as premature, but it was brought to bear upon the government which resulted in the eight-hour day and other reforms. Troelstra's influence with the proletariat increased rapidly, until in 1925, owing to failing health, he retired from politics.

TROGIR or **TRAU,** a seaport of Dalmatia, Yugoslavia. Pop. (1931) 23,525. The town is built upon an island connected with the mainland by a bridge. The Venetian loggia is a fine specimen of a 16th century court of justice; and the cathedral is one of the glories of Dalmatia. It is Hungarian Gothic, and founded in 1200, was only completed in 1450. Trau has some trade in fruit and wine, the fertile soil producing vines, figs, pomegranates and olives. The chief industries are the weaving of *rascia*, a coarse blue serge, and metal work.

Tragurium, by which name it was known to the Romans, was probably colonized about 380 B.C. by Syracusan Greeks from Lissa, and its name is sometimes derived from τράγηλος, a place near Syracuse. In 998 it submitted to Venice; but in 1105 it acknowledged the supremacy of Hungary, while retaining its municipal freedom, and receiving, in 1108, a charter which is quoted by Lucio. After being plundered by the Saracens in 1123, it was ruled for brief periods by Byzantium, Hungary and Venice. In 1242 the Tatars pursued Bela IV of Hungary to Trau, but were unable to storm the island city, which remained in the possession of Hungary till 1413. The Italians attempted to take possession of the town at the close of World War I, but were driven out by the inhabitants, 99% Slavs. After Germany's Balkan successes in World War II, Italy occupied the port (1941).

See T. G. Jackson, *Dalmatia, the Quarnero, and Istria* (Oxford, 1887); E. A. Freeman, *Sketches from the Subject and Neighbour Lands of Venice* (London, 1881); and G. Lucio, *Memorie istoriche in Trago, ora detto Trau* (Venice, 1673).

TROGLODYTES, "cave-dwellers," a name applied by ancient writers to different tribes in various parts of the world. Strabo speaks of them in Moesia, south of the Danube (vii. 318), in the Caucasus (xi. 506), but especially in various parts of Africa from Libya (xvii. 828) to the Red Sea. The troglodyte Ethiopians of Herodotus (iv. 183) in inner Africa, very swift of foot, living on lizards and creeping things, and with a speech like the screech of an owl, have been identified with the Tebus of Fezzan. According to Aristotle (*Hist. An* viii. 12) a dwarfish race of Troglodytes dwelt on the upper course of the Nile, who possessed horses and were in his opinion the Pygmies of fable. But the best known of these African cave-dwellers were the inhabitants of the "Troglodyte country" (Τρωγλοδυτική) on the coast of the Red Sea, as far north as the Greek port of Berenice, as recorded by Diodorus (iii. 32) and Photius (p. 454 Bekker) from Agatharchides of Cnidus, and by Artemidorus in Strabo (xvi. 776).

They were a pastoral people, living entirely on the flesh of their herds, or, in the season of fresh pasture, on mingled milk and blood. But they killed only old or sick cattle (as indeed they killed old men who could no longer follow the flock), and the butchers were called "unclean." They gave the name of parent to no man, but only to the cattle which provided their subsistence. They went almost naked; the women wore necklaces of shells as amulets. They practised circumcision or an operation of a more serious kind. The dead body, its neck and legs bound together with withies of the shrub called *paliurus*, was set up on a mound, and pelted with stones amidst the jeers of the onlookers, until its face was completely covered with them. A goat's horn was then placed above it, and the crowd dispersed with manifestations of joy.

TROGON, the name of birds forming the family Trogonidae. The trogons are birds of moderate size, the smallest hardly bigger than a thrush, the largest less bulky than a crow. The bill is wide at the gape, which is beset by recurved bristles. They seize most of their food on the wing. Their flight is short, rapid and spasmodic. Their feet are weak and of a unique structure, the second toe, which in most birds is the inner anterior one, being reverted; in all other birds that have two toes before and two behind, the outer toe is turned backward. The plumage is beautiful and characteristic, and the glory of the group culminates in the quezal (*q.v.*). The plumage is further remarkable for the absence of down and for the large size of its contour-feathers, which are extremely soft and so loosely seated as to come off in scores at a touch. The tail is a characteristic feature, the rectrices being often curiously squared at the tip. The nidification of these birds is in holes of trees, wherein are laid without any bedding two roundish eggs, generally white, but certainly in one species (quezal) tinted with bluish green.

The trogons form a very well-marked family of Coraciiform

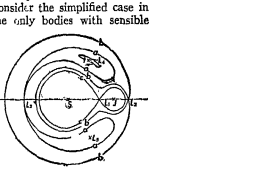
birds placed near the colies (*see* COLY) and swifts (*q.v.*). The remains of one have been found in the Miocene of France. This discovery seems to account for the remarkable distribution of the trogons at the present day. While they chiefly abound in the tropics of the New World, they occur too in the tropical parts of the Old. About sixty species are recognized, which J. Gould in the second edition of his *Monograph* of the family (1875) divides into seven genera

TROGUS, GNAEUS POMPEIUS, Roman historian from the country of Vocontii in Gallia Narbonensis, nearly contemporary with Livy, flourished during the age of Augustus. The name Pompeius was adopted by his grandfather, who received the citizenship from Pompey. Trogus' books on natural history are frequently quoted by Pliny; his principal work, however, was *Historiae Philippicae* in 44 books, so called because the Macedonian empire founded by Philip is the central theme of the narrative. This was a general history of the world, or rather of those portions of it which came under the sway of Alexander and his successors. Of this great work, we possess only the epitome by Justin, the *prologi* or summaries of the 44 books, and fragments. But even in its present mutilated state it is often an important authority for the ancient history of the East. Ethnographical and geographical excursuses are a special feature of the work.

Fragments edit. by A. Bielowski (1853); *see* also, A. H. L. Heeren, *De Trogi P. fontibus et auctoritate* (prefixed to C. H. Frotscher's edition of Justin), A. Enmann on the authorities used by Trogus for Greek and Sicilian history (1880); A. von Gutschmid, *Über die Fragmente des Pompeius Trogus* (1857); M. Schanz, *Geschichte der römischen Litteratur* (2nd ed., 1899), ii., where all that is known of Trogus is given; and article *JUSTIN*.

TROIA, a town and episcopal see of Apulia, Italy, in province of Foggia, 1,440 ft. above sea level, 7 mi N.W. of the station of Giardinetto-Troia, which is 16 mi. S.W. of Foggia. Pop. (1936) 7,037 (town), 7,334 (commune). It is on the site of the ancient Aecae, 12 mi. S. of Luceria, on the Via Traiana. Troia was itself founded in 1017 by the Greek prefect Basilius Bugianus. The cathedral dates from 1107, but the upper part of the façade with its rich sculptures, fine rose-window and polychromatic decoration, the choir apse and the interior were restored early in the 13th century. The bronze doors, partly in relief and partly in niello (1119–1127) were cast in Benevento by Oderisus.

TROILUS, in Greek legend, son of Priam (or Apollo) and Hecuba. In the *Iliad* (xxiv., 257) he is already slain before the action of the poem commences. According to a non-Homeric tradition (*e.g.*, Virgil *Aen.* i. 474), when a mere boy he fell by the hand of Achilles. In another account he was dragged to death by his own horses. His death formed the subject of a lost tragedy by Sophocles. The story of Troilus and Cressida (Caxton, Chaucer, Shakespeare, etc.) is entirely mediaeval.



TROITSK, the name of several Russian settlements, the most important of which is the town of Troitsk in the Uralsk Area, in 54° 4′ N., 61° 35′ E., on the Ui, a tributary of the Tobol. Pop. (1926) 29,643. A fort was erected here in 1743, which became a centre for trade with the Kirghiz steppe and Turkestan. A branch railway now links the town with Chelyabinsk and Sverdlovsk, and it is on the great Siberian road It has tanneries and flour-mills, the latter supplying the Ural mining district.

TROITSKOSAVSK, a town of Asiatic Russia, in the Buriat-Mongol A S S R., in 51° 28′ N., 106° E., on the Kyakhta river near its junction with the navigable Selenga, which forms a waterway from Asiatic Russia to Mongolia. Two miles south of it is Russian Kyakhta, on the frontier, which adjoins Chinese Kiakhta or Mai-mai-Chên, a walled town with a large marketplace, and 10 mi. N., at the confluence of the Kyakhta and Selenga, is Ust-Kyakhta. It was formerly the great route by which Chinese tea entered Russia; and its December fair, when Russian leather, furs and wool were exchanged for tea, was very important. From 1689 to 1727 the trade was a government monopoly, but from then till 1860 trade was thrown open to private merchants and as all trade across the Chinese frontier was by law compelled to pass through it, the town increased greatly in importance. In 1860, however, the whole frontier was declared open, and Kyakhta declined; the Transbaikal railway further diminished its importance The combined population of Troitskosavsk and Kyakhta was only 12,000 in 1938. Gold and osmiridium are found in the district, and salt is worked. A railway is projected to link Verkhne-Udinsk with Kyakhta, and this might restore the prosperity of the town, as there is a great market for leather in Mongolia, which has no tanneries; raw hides are often sent via this route to be dressed and re-exported. The altitude is 2,600 ft., and the climate severe (average January temperature, −18·4° F, average July, 67·1° F, and of the annual rainfall of 11 in., 7·5 fall in July and August). The town was a storm centre in the post 1917 period, and was the scene of the massacre of 800 Bolshevik prisoners in 1920 by order of the Cossack ataman Semyonov.

TROJAN PLANETS, a group of asteroids revolving around the sun in the same period as Jupiter. Achilles, the first member of the group, was discovered on Feb. 22, 1906, by Prof Max Wolf in the course of a systematic search for new asteroids that was carried on by photography at the Königstuhl observatory, Heidelberg.

The orbit was calculated by Dr. Berberich at the Berlin Rechen-institut; he found that its period was almost exactly that of Jupiter. Thereupon Prof. C V. L. Charlier, of Lund observatory, noting that Achilles was about 55½° in front of Jupiter, as seen from the sun, suggested it was an example of one of the particular cases of planetary motion deduced by Joseph Louis Lagrange in 1772. Until 1906 these results had been of mathematical interest only.

Lagrange's work dealt with the general problem of three bodies. For the present purpose we may consider the simplified case in which the sun and Jupiter are the only bodies with sensible masses, the orbit of Jupiter being considered circular. The figure represents schematically a co-ordinate system rotating with Jupiter's period in which the sun, S, and Jupiter, J, will occupy fixed positions. A planet located in any of the three points L_1, L_2 or L_3 on the line joining S and J, or at either of the points L_4 or L_5, which form equilateral triangles with S and J, if started with an appropriate velocity, will then continue to occupy the same position relative to the sun and Jupiter. The straight-line solutions are unstable and of little practical importance, though it has been suggested that the *Gegenschein* or counterglow, may be due to particles in the neighbourhood of a point L_2 connected with the sun and the earth. The greater practical significance of the equilateral solutions is due to the fact that these solutions are stable in the sense that small oscillations about these positions exist provided that the ratio between the masses of S and J is greater than 25·96. This condition is certainly satisfied by the sun and Jupiter, where the mass ratio is approximately 1,047. The oscillations about the triangular points fall into two classes; (1) an oscillation, called the libration, with a period of about 148 years for small amplitudes, increasing with the amplitude; (2) oscillations with approximately the same period as that of Jupiter's revolution, about 11.86 years.

Libration path of a Trojan planet and limiting orbits related to this type of planetary motion. The sun, S, and Jupiter, J, occupy fixed positions. A planet located in any of the three points L_1, L_2, L_3, or at L_4 and L_5 (which form equilateral triangles with S and J), will then continue to occupy the same position relative to the sun and Jupiter. If started with an appropriate velocity. The sequence of orbits is shown schematically

Oscillations of this second type correspond to the eccentricity and inclination of the asteroid. In the case of Achilles these are approximately 0·15 and 11° respectively. If the oscillations of class (2) are ignored, the path of Achilles may be represented by the small elongated arc *s* about the equilateral point L_4.

Achilles did not long remain the sole example of this type of motion. Within a year two additional asteroids of this group were found. By subsequent discoveries the membership of the group stood at 12 in 1944, the latest addition having been made in 1937. All were discovered at the Königstuhl observatory. Of the 12 known members, 7 asteroids—588 Achilles, 624 Hector, 659

Nestor, 911 Agamemnon, 1,143 Odysseus, 1,404 Ajax, and 1,437 Diomedes—are in the neighbourhood of the triangular point L_4 which is 60° ahead of Jupiter (greater longitude). Five asteroids —617 Patroclus, 884 Priamus, 1,172 Aeneas, 1,173 Anchises and 1,208 Troilus—are about 60° behind Jupiter.

The name Trojan planets or Trojan asteroids is derived from the circumstance that the members of this group have received names taken from the *Iliad* of Homer. Unfortunately, the obvious plan of giving Greek names to those on one side, Trojan names to those on the other, was not followed, but it would cause confusion to change now. As a group they belong among the fainter known asteroids. A comparison in size with other equally faint asteroids requires making allowance for the greater distance of a Trojan planet from the sun and the earth. If equality of reflecting power is assumed it is found that a Trojan planet appears as faint as an asteroid having only one-fourth its diameter, but located within the principal ring between the orbits of Mars and Jupiter. Notwithstanding their faintness, therefore, the Trojans rank among larger asteroids.

The first investigations on the mathematical theory of the motions of the known Trojans were by L. J. Linders (1908). The most complete analysis of the problem yet made is by Prof. E W. Brown (1923) and later by E. W. Brown and C. A. Shook (1933). Of considerable interest is the effect of the attractions by Saturn upon the motion of a Trojan asteroid. Brown found that perturbations in the motion of Jupiter with a period which is long compared with the libration period are impressed upon the Trojan planet; and that the action of Jupiter prevents it from having very large direct perturbations of very long period due to other planets.

Sequence of Orbits.—The Trojan asteroids that have been discovered show amplitudes of the libration up to about 20°. Brown developed methods for dealing with such cases and those of still larger amplitude. He investigated the problem further in its simplified case in which it is assumed that Jupiter's orbit is circular. The orbits considered are those that lie in the same plane as the orbit of Jupiter, and that are free from the eccentricity type of oscillation. The sequence of orbits is illustrated schematically in the figure.

Beginning with a planet at either L_4 or L_5, one obtains orbits of moderate amplitudes, such as t in elongated paths surrounding L_4 or L_5. For greater amplitudes the path becomes less and less symmetrical, extending farther away from J than toward J. This type of orbit ends in an orbit a that has a cusp in the point L_3. Beyond this limiting type the orbits have the shape of a horseshoe, surrounding L_3, L_4, and L_5, and coming to a conclusion in the orbit b which has a cusp at L_2.

Extending the sequence, there are two continuations: (1) orbits that lie wholly outside b and which are therefore simple periodic orbits surrounding both masses S and J, and (2) orbits of an hourglass shape that lie between b and c. Again, c is a limiting type, with a cusp in L_1, beyond which the orbits separate into orbits surrounding S only or orbits surrounding J only.

All the orbits considered here are members of one single family of periodic orbits, namely, those that correspond to the circular solution in the problem of two bodies. It is interesting and significant that the curves show such great similarity with the "curves of zero velocity" in the restricted problem of three bodes (*see* Celestial Mechanics).

Unfortunately, the limiting cases that separate the different types of motion present great difficulties in analytical treatment. Therefore no certain information exists concerning the possibility that the action of other planets, and especially Saturn, may cause a Trojan to change into a non-Trojan or, conversely, change an orbit circling around the sun or Jupiter, or both, into a Trojan type.

TROJAN WAR: *see* Troy and Troad.

TROLLE, HERLUF (1516–1565), Danish naval hero, was born on Jan. 14, 1516, at Lillo. At the age of nineteen Trolle went to *Vor Frue Skole* at Copenhagen, subsequently completing his studies at Wittenberg, where he adopted the views of Melanchthon, with whom he was in intimate correspondence for some years. His marriage with Brigitte, the daughter of Lord Treasurer Mogens Gjöe, brought him a rich inheritance, and in 1557 he took his seat in the senate. Both Christian III. and Frederick II. had a very high opinion of Trolle's trustworthiness and ability and employed him in various diplomatic missions. Trolle was, indeed, richly endowed by nature, and his handsome face and lively nature made him popular everywhere. His one enemy was his wife's nephew, Peder Oxe, the subsequently distinguished finance minister, whose narrow, grasping ways, especially as the two men were near neighbours, did not contribute towards family harmony. In 1559 Trolle was appointed admiral and inspector of the fleet, and in 1563 he superseded the aged Peder Skram as admiral in chief. On May 10 he put to sea with twenty-one ships of the line and five smaller vessels and, after uniting with a Lübeck squadron of six liners, encountered, off the isle of Öland, a superior Swedish fleet of thirty-eight ships under Jacob Bagge. Supported by two other Danish ships Trolle attacked the Swedish flagship "Makalös" (Matchless), then the largest flagship in northern waters, but was beaten off at nightfall. The fight was renewed at six o'clock the following morning, when the "Makalos" was again attacked and forced to surrender, but blew up immediately afterwards, no fewer than 300 Lubeck and Danish sailors perishing with her. The Swedish admiral was captured, and the remnant of the Swedish fleet took refuge at Stockholm. Despite the damage done to his own fleet and flagship "Fortuna" by this victory, Trolle, on Aug. 14, fought another but indecisive action with a second Swedish fleet under Klas Horn, and kept the sea till Oct. 13. Trolle spent the winter partly at his castle of Herlufsholm completing his long cherished plan of establishing a school for all classes, and partly at Copenhagen equipping a new fleet for the ensuing campaign. On June 1, 1565, he set sail with twenty-eight liners, which were reinforced off Femern by five Lubeck vessels. Klas Horn had put to sea still earlier with a superior fleet and the two admirals encountered off Fehmarn on June 4. The fight was severe but indecisive, and both commanders finally separated to repair their ships. Trolle was severely wounded in the thigh and shoulder, but he insisted on being the last to receive the surgeon's attention. He died of his wounds at Copenhagen on June 25.

TROLLHÄTTAN, a town of Sweden in the district (*län*) of Älfsborg, 45 mi. by rail N by E. of Gothenburg. Pop. (1943), 18,570. It lies on the left (east) bank of the Göta at the point where that river descends 108 ft. in the course of nearly a mile by the famous falls of Trollhättan (six in number) and several rapids. The scenic setting of the falls is not striking, but the great volume of water, nearly 18,000 cu.ft. per second, makes the falls imposing. The narrowed river here surrounds several islands, on either side of one of which (Toppö) are the first falls of the series, Toppó and Tjuf. These are 42 ft. in height. The water-power is used in rolling-mills, a cellulose factory and other works. The electric works supply power to Gothenburg and other Swedish towns. (*See* Göta.)

TROLLOPE, ANTHONY (1815–1882), English novelist, was born in London, April 24, 1815. He came of a family which engaged in literary pursuits. His father, Thomas Anthony Trollope (1774–1835) was a learned but unbusinesslike barrister, who spent much time on an *Encyclopedia Ecclesiastica* and gave up law for farming, with ruin as the result. His mother, Frances Milton Trollope (1780–1863) went with her husband to Cincinnati to retrieve their fortunes by running a fancy-goods shop, and coming back disappointed achieved notoriety and roused violent resentment by her caustic book, *Domestic Manners of the Americans* (1832). She afterwards wrote some fifty novels and books of travel, and maintained the family by her literary earnings, her best novel being *The Vicar of Wrexhill* (1837) and *The Widow Barnaby* (1839), a fair second. (See *Frances Trollope, her Life and Literary Work*, 1895, by her daughter-in-law.) Her

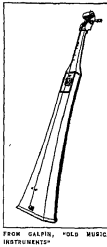
eldest son, THOMAS ADOLPHUS TROLLOPE (1810–92), was a popular writer of novels and miscellaneous works, largely on Italian subjects, his adopted home being in Florence. His second wife, FRANCES ELEANOR TROLLOPE, also a novelist, collaborated with him in *Homes and Haunts of Italian Poets* (1881)

Anthony, who was the third son, gave an unvarnished account of his unhappy youth in his *Autobiography* (which was edited by his son Henry M. Trollope in 1883), an extraordinarily candid book that had a disillusioning effect on too fervid admirers by giving away the secrets of his workshop It probably caused the long eclipse of his fame, which has recently been followed by a striking renewal. During the family impecuniosity, he was a day-boy at Winchester and Harrow, and suffered pangs through his shabby and dirty appearance, and the unpopularity and general discouragement which were the result. He reached the verge of manhood almost as ignorant as if he had had no schooling at all, yet he tried to start in life by taking the post of classical usher in a private school in Brussels. But he received the offer of a clerkship in the General Post Office, London, and after a farcical pretence at an examination was appointed (1834). For the seven years of his service here, his salary was small, he was in debt, troubled with awkward love-affairs, and often in hot water with his superiors. Then he was transferred to Ireland (1841) as a surveyor's clerk, with a moderate salary but liberal allowances and the duties of a sort of travelling inspector The change brought out a business capacity hitherto unsuspected He enjoyed a comfortable income, he had time in spite of a busy life to indulge freely in hunting, he consorted with people of all classes and began to stock his memory for the long-cherished purpose of trying his hand at fiction, and in 1844 he married an English lady, Rose Heseltine, whom he had met in Ireland, and established himself in a house at Clonmel.

Trollope's first two novels, *The Macdermots of Ballycloran* (1847) and *The Kellys and the O'Kellys* (1848), failures though they proved, are examples of his thoroughness in making himself acquainted with a given sphere of life, as he was afterwards to do with clerical society, political life, and legal affairs, and also of his aptitude for developing a good story casually heard. The first is dark and pathetic, the second has many sparkling scenes; neither is the work of a Carleton or Banim, but both steer clear of the mere stage Irishman of Lever and Lover. Trollope persevered, but a historical novel, *La Vendée* (1850) deservedly fell flat.

A chance visit to Salisbury Close gave him his idea for *The Warden* (1855), the simple, touching, but humorous story of a precentor in a cathedral town, who out of sensitiveness to public criticism resigns the well-paid office of warden to an ancient charity. Mr. Harding and his blustering son-in-law Archdeacon Grantly reappear, with other clerical dignitaries, their wives, families and friends, including the famous "Bishopess," Mrs Proudie, the unctuous and pushful Mr. Slope, and the epicurean Dr. Stanhope and his disreputable children, in *Barchester Towers* (1857). The "Barsetshire Chronicles" were thus launched, bringing their author praise and, in due time, substantial profit. Trollope was now inspector of rural deliveries for the south-west of Ireland, with a roving commission that suited his tastes, scope for improvements on which he prided himself, and plenty of time for hunting. He is said to have been the inventor of the pillar-box His ability and his experience of Post Office business led to his being sent on a mission to the West Indies (1858), which gave him material for a travel-book, *The West Indies and the Spanish Main* (1859). Other official journeys took him to Egypt (1858), the United States (1861), Australia and New Zealand (1871–72), and South Africa (1878), and resulted in further gossipy narratives and several tales He got himself transferred to England (1859), taking charge of the eastern postal district and settling in a house at Waltham Cross. He retired from the Post Office (1867), out of annoyance at being passed over for promotion. Trollope was instrumental in starting the *Fortnightly Review* (1865), edited the *St. Paul's Magazine* (1868), rather disastrously, and was a contributor to *Cornhill*, *Blackwood* and other periodicals. He stood for Beverley (1868), but only acquired useful experience for future novels of political life.

All this time he was steadily writing fiction. The first of his books to bring him remuneration was *The Three Clerks* (1858), a poor novel of the Civil Service which sold for £250. But before long, he tells us in the *Autobiography*, he was earning on the average £4,500 a year, and in one instance he received £3,525 for a single book. An enormous output—for, besides more than fifty novels he wrote much else, and believed that no writer had made a larger contribution to letters in an equal space of time—was rendered possible by a methodical apportionment of the 24 hours. He rose regularly at 5 30 A.M., wrote steadily for two hours and a half, at the rate of 250 words every quarter of an hour, and thus calculated each book as so many days' work, which was carefully checked off as it proceeded. Yet he found leisure to hunt three times a week during the season, played whist daily, and had plenty of time for social enjoyments. He lived in London for about eight years (1872–80), and then removed to the village of Harting, under the Sussex Downs. He was staying in town when he died of paralysis, Dec. 6, 1882.



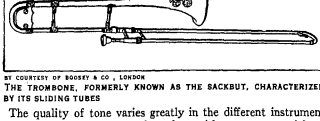
Trollope was a big, bluff, vociferous person, whose blustering and overbearing ways offended some, but whose John Bull philistinism did not conceal an essential honesty and good nature and a tender heart. He thought *Pride and Prejudice* the greatest novel in the language, and he idolized Thackeray; but he was as far from the exquisite art of the one writer as from the perfect mastery and irony of the other. With perhaps too much fidelity to the usual and commonplace, he depicted the great middle class as it was in mid-Victorian times. He was a "character-monger" of first-rate quality, who showed his personages moving in their own little spheres, and as he widened his circle of characters took in a larger sweep until he embraced almost as large and diversified a world as that surveyed by Thackeray. Among the characters that stand out, along with the two or three already mentioned, Mr. Crawley, the grimly pathetic hero of *The Last Chronicle of Barset*, the wicked but delightful Signora Neroni, Lucy Robarts, the best of many admirable heroines (unless Lady Glencora be preferred to that place), her husband, Mr. Plantagenet Palliser, afterwards Duke of Omnium, Lady Lufton, and that shrewd and downright person Miss Dunstable, with such different examples of the unattractive in life turned to artistic account as Mr. Sowerby and Mr. Chaffanbrass—these make a notable gallery and are only a selection from the catalogue Other characters show uncertainty of touch and a failure of motivation. Trollope was best at a sort of coarse or at any rate very broad comedy, but he also had a command of real pathos. Tragedy was outside his scope. He revelled in mankind's idiosyncrasies, but shirked the closer scrutiny into the byways of conscience, just as he was shy of the spiritual questions which must, surely, have played some part in the lives of his clerical personages. George Eliot, his contemporary, would have dealt with Mr. Harding and Mr. Crawley in a totally different way.

Besides *The Warden* and *Barchester Towers*, the Barchester series comprises:—*Dr. Thorne* (1858), *Framley Parsonage* (1864), *The Small House at Allington* (1864), and *The Last Chronicle of Barset* (1867). The best of Trollope outside that series, besides such as are named above, are probably *Orley Farm* (1862), *Can You Forgive Her* (1864), *Phineas Finn* (1869) and its sequel *Phineas Redux* (1874), *The Claverings* (1867), *The Belton Estate* (1866), *He Knew He was Right* (1869), *The Vicar of Bullhampton* (1870), *The Eustace Diamonds* (1873), *The Way We Live Now* (1875), *The American Senator* (1877), *The Duke's Children* (1880), *Ayala's Angel* (1881) and *Mr. Scarborough's Family* (1883). Trollope's *Autobiography* was edited by his son (1883). The best biography is T. H. S. Escott's *Anthony Trollope, His Work, Associates and Literary Originals* (1913) which may be supplemented by Michael Sadler's *Trollope, a Commentary* (1927), H Walpole's *Trollope* ("English Men of Letters," 1928), Leslie Stephen's *Studies of a Biographer*, IV. (1902), Henry James's *Partial Portraits* (1888), and Professor Saintsbury's "Trollope Revisited" (*Essays and Studies by members of the English Association*, VI., 1920).

(E. A. Ba)

TROMBA MARINA or **MARINE TRUMPET**, an obsolete bowed instrument about 6ft. in length, with an outline somewhat recalling that of an elongated cricket bat. It consisted of a body and neck in the shape of a truncated cone resting on a triangular base. In the days of Michael Praetorius (1618) its

length was 7ft. 3in. and the three sides at the base measured 7in., tapering to 2in. at the neck. These measurements varied considerably, as did also the shape of the body and the number of strings. The bridge had the curious feature that a portion of its foot was left loose so that it vibrated against the belly with every movement of the bow, producing a trumpet-like timbre. It is to this feature, in conjunction with its general resemblance in contour to the marine speaking-trumpet of the middle ages, that the name of the instrument is doubtless due, though other derivations have been suggested In Germany, at the time when the trumpet was extensively used in the churches, nuns often substituted the tromba marine, whence the name *Nonnengeige*. The instrument, whose tone was not beautiful, fell into disuse during the first half of the 18th century.



FROM GALPIN, "OLD MUSICAL INSTRUMENTS"

THE TROMBA MARINA, AN OBSOLETE STRING INSTRUMENT

TROMBONE, an important member of the brass wind family of musical instruments formerly known as sackbut (*q.v.*). The trombone is characterized by the slide, consisting of two parallel cylindrical tubes, over which two other cylindrical tubes, communicating at their lower extremities by means of a short semicircular pipe, slips without loss of air. The outer tube, therefore, slides upon the inner, thereby altering the total length of tube and so modifying the pitch. When the slide is closed the instrument is at its highest pitch To the upper end of one of the inner tubes is fastened the cup-shaped mouthpiece and to the end of the other tube is fixed the bell-joint, on the proper proportions of which depend the acoustic properties of the instrument.

Sound is produced on the trombone, as on the horn, by means of the lips stretched like a vibrating reed across the cup mouthpiece from rim to rim; the acoustic principles involved are the same for both instruments By overblowing, *i.e.*, by the varying tension of the lips and pressure of breath, the harmonic series is obtained, which is effective between the second and the tenth harmonics, the fundamental being but rarely of practical use There are seven positions of the slide on the trombone, each giving a theoretical fundamental tone and its upper partials a semitone lower than the last, and corresponding to the seven shifts on the violin and to the seven positions on valve instruments. These seven positions, which give a complete chromatic compass of two octaves and a sixth, are found by drawing out the slide a little more for each one

BY COURTESY OF BOOSEY & CO., LONDON

THE TROMBONE, FORMERLY KNOWN AS THE SACKBUT, CHARACTERIZED BY ITS SLIDING TUBES

The quality of tone varies greatly in the different instruments and registers. The alto trombone has neither power nor richness of tone, but sounds hard and has a timbre between that of a trumpet and a French horn. The tenor and bass have a full rich quality suitable for heroic, majestic music. The contra-bass trombone, formerly little in request in the concert hall, is required for some modern orchestral music.

Besides the slide trombone, which is most largely used, there are the valve trombones, and the double-slide trombones. The former in which the slide is replaced by three pistons permit more brilliant execution than the slide instruments, but their tone is inferior. In the double-slide trombone the sliding branches are doubled and their length accordingly halved, thereby making the instrument more compact and lessening the length of the shifts, though demanding greater nicety in the adjustment of the slide

The evolution of the trombone from the buccina is referred to in the article on the sackbut (*q.v.*), the name by which the earliest draw or slide trumpets, and subsequently the trombones, were known in England

Of all wind instruments the trombone has perhaps been least modified in form; changes have occasionally been attempted, but for the most part with only trifling success. The application of ventils or pistons was made for the first time in 1818, in Germany, but instruments of this kind, though extensively used, have never superseded the original sliding type

TROMP, the name of two famous Dutch admirals

1. MARTIN HARPERTZOON TROMP (1597–1653) was born at Brielle, South Holland At the age of eight he made a voyage to the East Indies in a merchantman, but was made prisoner and spent several years on board an English cruiser. On making his escape to Holland he entered the navy in 1624, and in 1637 was made lieutenant-admiral. In February 1639 he surprised, off the Flemish coast near Gravelines, a large Spanish fleet, which he completely destroyed, and in the following September he defeated the combined fleets of Spain and Portugal off the English coast—achievements which placed him in the first rank of Dutch naval commanders. On the outbreak of war with England Tromp appeared in the Downs in command of a large fleet and anchored off Dover. On the approach of Blake he weighed anchor and stood over towards France, but suddenly altered his course and bore down on the English fleet, which was much inferior to his in numbers In the engagement which followed (May 19, 1652) he had rather the worst of it and drew off with the loss of two ships. In November he again appeared in command of eighty ships of war, and a convoy of 300 merchantmen, which he had undertaken to guard past the English coast. Blake resolved to attack him, and, the two fleets coming to close quarters near Dungeness on Nov. 30, the English, after severe losses, drew off in the darkness and anchored off Dover, retiring next day to the Downs, while Tromp anchored off Boulogne till the Dutch merchantmen had all passed beyond danger. The statement that he sailed up the Channel with a broom at his masthead in token of his ability to sweep the seas is probably mythical. In the following February (1653), while in charge of a large convoy of merchantmen, he maintained a running fight with the combined English fleets under Blake, Penn and Monk off Portland to the sands of Calais, and, though baffling to some extent the purposes of the English, had the worst of the encounter, losing nine ships of war and 30 or 40 merchantmen. On June 3, he fought an indecisive battle with the English fleet under Richard Dean in the Channel, but the arrival of reinforcements under Blake on the following day enabled the English to turn the scale against him and he retired to the Texel with the loss of seventeen ships. Greatly discouraged by the results of the battle, the Dutch sent commissioners to Cromwell to treat for peace, but the proposal was so coldly received that war was immediately renewed, Tromp again appearing in the Channel towards the end of July 1653. In the hotly contested conflict which followed with the English under Monk on the 29th Tromp was shot by a musket bullet through the heart. He was buried with great pomp at Delft, where there is a monument to his memory

2 CORNELIUS VAN TROMP (1629–1691), the second son of the preceding, was born at Rotterdam on Sept. 9, 1629 At the age of 19 he commanded a small squadron charged to pursue the Barbary pirates. In 1652 and 1653 he served in Van Galen's fleet in the Mediterranean, and after the action with the English fleet off Leghorn on March 13, 1653, in which Van Galen was killed, Tromp was promoted to be rear-admiral. On July 13, 1665 his squadron was, by a hard stroke of ill-fortune, defeated by the English under the duke of York. In the following year Tromp served under De Ruyter, and on account of De Ruyter's complaints of his negligence in the action of Aug. 5, he was deprived of his command. He was, however, reinstated in 1673 by the stadtholder William, afterwards king of England, and in the actions of June 7, and 14, against the allied fleets of England and France, manifested a skill

and bravery which completely justified his reappointment In 1675 he visited England, where he was received with honour by King Charles II. In the following year he was named lieutenant-admiral of the United Provinces He died at Amsterdam on May 29, 1691, shortly after he had been appointed to the command of a fleet against France Like his father he was buried at Delft

See H. de Jager, *Het Geslacht Tromp* (1883); and T. de Liefde, *Great Dutch Admirals* (trans 1873).

TRØSO, a seaport of Norway, capital of the *fylke* (county) and *bispedømme* (diocese) of the same name on the northwestern coast. Pop. (1946) 11,146. It stands on an islet between Kvalø and the mainland. The town has fish oil factories and tanneries, and makes boots and shoes, there are boats for whaling The buildings, many of wood, include the town hall and a museum. Sealskins and other furs, dried and smoked fish and whale and seal oil are exported, and the herring fishery is productive. The port was occupied by German troops in April 1940.

TRONDHEIM or TRONDHJEM, a city and seaport of Norway; chief town of the diocese of Trondheim and the county of Sør-Trøndelag, 384 mi by rail N of Oslo. Pop. (1946) 56,522 It lies on the Trondheim fjord on a peninsula between the fjord and the river Nid. The cathedral is the finest church in Norway, and the scene of coronation of the Norwegian kings Building was begun in the 11th century and continued through the 12th and 13th centuries. Repeatedly the church was burned, but as often restored. In the 20th century it was expanded and enriched with Vigeland sculptures. The port ordinarily maintains communications up and down the coast and with Hull, Newcastle, Hamburg, etc ; trade is chiefly in timber, wood pulp, oil, fish and copper. In the town are shipbuilding, fish-curing, sawmills and machine works. Olaf Tryggvessön founded the town of Nidaros here in 996, building a church and a royal residence. (For a brief time from 1930 the town was renamed Nidaros.) It became an archbishopric (1152) and was the capital to 1380. It was an important pilgrimage centre, but suffered many sieges Declining after the Reformation period, its commerce and population grew rapidly again in the 20th century, aided by new port facilities and the railway from Oslo (1921). Here is Norway's great technical school. Trondheim was one of the first ports attacked by the Germans in 1940, and although taken and held, it became a centre of popular resistance to the invaders.

TROON, a small burgh, seaport and watering place of Ayrshire, Scotland. Pop. (est. 1938) 8,666. Area 2 sq.mi. It is 6 mi N.W. of Ayr, and 35 mi. S W. of Glasgow by the L M S. railway. It has a fine natural harbour with a breakwater 3,000 ft. long, and two graving docks. Shipbuilding is the leading industry, coal the chief export and iron the chief import

TROPHY (Gr. *τρόπαιον*), a memorial of victory set up on the field of battle at the spot where the enemy had been routed. It consisted of captured arms and standards hung upon a tree (preferably an olive or an oak) and booty heaped up at its foot, dedicated to the god to whom the victory was attributed. If no suitable tree was at hand, a lopped trunk was fixed in the ground on an eminence. The tree or trunk bore an inscription containing the names of the god and the combatants, a list of the booty and the chief incidents of the battle. In the case of a naval victory the trophy, composed of the beaks of ships, was set up on the nearest beach and consecrated to Poseidon It was regarded as a sacrilege to destroy a trophy, since it was dedicated to a god.

To facilitate reconciliation with their conquered foes, neither the Macedonians nor the Romans in early times erected such trophies. The Romans showed a preference for setting up the memorials of victory in Rome rather than on the field of battle: such were the trophies of Marius recording his victories over Jugurtha and the Cimbri and Teutones. In imperial times their place was taken by columns or triumphal arches (*see* ROMAN ARCHITECTURE; TRIUMPHAL ARCH).

TROPICAL AGRICULTURE. From the humid tropics come the world's bananas, pineapples, coconuts, coffee, cacao (chocolate) and tea; most of the sugar; jute, abacá (Manila hemp) and ramie fibre; quinine, strychnine, rotenone and other medicinal and insecticidal materials; black and white pepper, cloves, nutmegs, mace, cinnamon and other spices; tapioca (sago); kapok; palm, coconut and sesame oils; and much of the rice The tropics are also the source of many of the fine cabinet woods such as mahogany, teak, Spanish "cedar," rosewood and ebony. Other important tropical forest products are rubber, gutta percha and balata, rattan; chicle, the basis of chewing gum, shellac, and the varnish gums copal and dammar

Tropical fruits and root crops extensively utilized and much prized in the regions where grown, such as papaya, durian, mangosteen, mango, breadfruit, yams and cassava (manioc), either do not ship well or for other reasons are little known outside the tropics Better known are the more widely adaptable tropical or subtropical crops of cotton, corn (maize), sweet potatoes, tobacco, citrus fruits, sisal and henequen.

In different parts of the tropics the total amount as well as the distribution of the rainfall throughout the year varies widely The sunshine is very bright, and the maximum temperature of the day often is affected more by the presence or absence of clouds than by the position of the sun at midday, for at noon the year around the sun is never far from the zenith In humid tropical lowlands the temperature in the shade is usually between 70° and 90° F , even at night it seldom falls [illegible] F per day is often much [illegible] F The high humidity,

[illegible]

tant and much prized temperate zone plants do not thrive no matter how temperate the mountain-top climate, because for flowering and fruiting these plants must have dormant periods as well as seasonal changes in the relative length of day and night.

Indigenous or subsistence methods of production of tropical crops vary widely, depending upon local traditions and food habits, the fertility of the soil, the density of the population and the degree to which trading for rice culture is possible. On well-drained soils the simplest crop production method is to modify the wild forest slightly by thinning and clearing the underbrush, to leave wild fruit or other trees, or to provide shade for such crops as abacá, coffee or ginger, which may be planted under the forest trees.

Usually misunderstood by travellers from the temperate zone is shifting cultivation (*kaingining*, Tagalog), or the production of annual food, fibre or tobacco crops in temporary clearings (*kaingins*) in the forest Early in the dry season the brush and forest trees, which have served as the cover crop on the land selected, are cut and burned. The forest had exterminated the weeds, restored the physical condition of the soil, and some of the nutrients liberated for the crop plants by the burning had been brought up by the forest tree roots from deep below the surface. After the first showers of the rainy season have moistened the soil, the seed of the crop plants is dibbled into the unstirred soil. An occasional weeding, and protection against birds and other animals, is the only care given. Since the soil is not stirred, erosion is kept at a minimum even though the very steep slopes are *kaingined*. Usually only one or two crops are raised in a clearing before the weeds and other pests become serious, or the fertility declines. Then the land is abandoned to forest. Often *kaingining* is the only method by which annual subsistence crops can be produced on infertile upland soils. As long as there is abundant land, *kaingining* is a practicable and usually justifiable method of crop production, requiring much human labour per unit of crop, but no draught animals, nor tools other than a heavy knife and a planting stick. However, where the pressure of population increases, and the land must be cleared again and planted before the forest cover

crop has choked out the weeds and restored the structure, coarse grasses and other weeds in the *kamgon* cannot be kept under control Then annual grass fires prevent the natural return of the forest, and the land will no longer yield crops by this method Plowing or other means of controlling the grass and maintaining satisfactory tilth must be employed, and since forest ash is no longer added to the soil, manures must often be applied to provide the nutrients necessary for the shallow-rooted annual crop plants

Where the land can be flooded for some months annually, lowland rice can be grown. If the soil is plowed and harrowed while flooded, and the rice seedlings transplanted into the mud, relatively good yields can be obtained even from very infertile soils This is an important factor in supporting the high density of the population in southeastern Asia, where rice is the principal food crop The world market price for rice, or other crops produced by the small farmer in the tropics, is no criterion of the costs of production, the farmer sells his excess crops for what they will bring

Black and white pepper, vegetables and tropical fruits are often grown by intensive Chinese gardening methods which require laborious soil management, draining, fertilization and other practices

On the less steep lands in Central America, the plow and other animal-drawn implements are employed for maize and other subsistence crop production In India a crude plow is used in the production of wheat, sorghum, cotton and other crops. But in other tropical regions the use of the plow is often limited to the preparation of lowland flooded rice fields, for not only is it not necessary to plow *kamgins*, but the general practice of spreading the seed by planting a mixture of different crops in the same field, reduces the utility of animal-drawn implements

Tropical Animal Husbandry.—Neither draught animals nor animal manures are used in *kamgoing* in the forestry methods of rubber or fruit production. Nevertheless, livestock are important in subsistence agriculture in the tropics. Water buffaloes and cattle are used for draught and as pack animals, and in certain regions are valued for their milk and their manure Moreover, their sale is often the chief source of cash for subsistence farmers In some regions hogs are also important. Horses, mules and donkeys are used for riding and for pack animals, while in some regions elephants are used in logging and as pack animals Goats in certain regions are the chief source of meat. Chickens are valued for fighting as well as for eggs and for meat Ducks are raised in great numbers in certain regions, while the pond culture of fish is deservedly important.

By comparison with temperate zone livestock, animals in tropical regions are usually considerably smaller and of far from ideal conformation Growth is slow, and yield of milk is low; eggs are small and the annual number laid is low. Nevertheless, the livestock of tropical regions are relatively resistant to several of the more serious endemic diseases and parasites and are able to exist on the relatively poor pastures and other local feeds, without being fed concentrates Since highly-bred, temperate-zone livestock rapidly decline under such conditions, and generally succumb to the diseases unless most carefully attended by a competent veterinarian, practically all importations of highly-bred temperate-zone livestock into the tropics have been failures. In Hong Kong, air-conditioned barns were used at one time for imported dairy cows The most promising line of improvement of tropical livestock is by selection and breeding of the best from the native breeds. In some cases crossbreeding with temperate-zone strains is effective, providing hardiness and disease-resistance can be retained while improving the desired milk or meat yield and other characteristics

Plantation Agriculture.—Tea, cacao, coffee, Hevea rubber, oil palms and sugar cane are often grown in large plantations financed and supervised by Europeans Where plantation agriculture has been a success, it has primarily been because of: (1) the utilization of specialized processes requiring technical control and heavy investments for machinery and equipment (tea and sugar); or (2) carefully worked out and specialized rapid transportation and cold storage and marketing facilities, as in the banana industry; or (3) some accident, as in the absence of the leaf disease in the far east, high-yielding strains (clones) of Hevea rubber were easily selected and propagated Where, as a result of engineering and agricultural research, intensive crop production and disease-control methods have been applied, as in the overhead irrigation and spraying of banana plantations from high-pressure piping installations, and soil rejuvenation by silt deposition, additional advantages may be gained which more than offset the heavy overhead expenses of plantation enterprises.

Although the natives have always grown their tree and shrub crops as "forest" crops, it was long the practice of plantations to employ European-style clean culture, soil-stirring, horticultural methods for the production of tea, coffee and rubber Such exploitive methods, particularly ill-suited to tropical soils exposed to heavy rainfall, have, to an increasing degree, been replaced by appropriate permanent cover crop, shade tree and mulching methods, combined with the use of commercial fertilizers. Such practices greatly retard erosion and maintain production at a satisfactory level.

Scientific research of high quality has been supported generously by individual plantation corporations and associations of planters, particularly in the Hawaiian Islands and in the Netherlands Indies, and by increasing the yields and the quality of the products has proven a profitable investment. The relatively less well-staffed and equipped government-supported experiment stations and extension activities in tropical regions have ministered mainly to the needs of the peasant farmers producing subsistence crops

To an increasing degree, native farmers located near plantation processing and shipping facilities are producing improved varieties of coffee, tea and sugar cane developed by the experiment stations, and selling their crop fresh to the central factory for processing and marketing More and more Hevea rubber is also being produced by peasant farmers in small plantings. (R. L. PR.)

TROPICAL MEDICINE. Tropical medicine, by definition, is the practice of medicine in the warm climates The scope of tropical medicine includes the majority of those ills that affect the human race in temperate climates, and in addition, a small group of disease entities that are in some manner dependent for their existence on factors peculiar to a tropical environment Aside from this small group of inherently tropical entities, the major health problems are diseases intimately associated with the uniformly low levels of sanitation, education and economic well-being prevalent in many tropical regions Thus the infectious diseases and the nutritional deficiencies assume major importance; malignancy and chronic degenerative diseases, although present, are of relatively little consequence from the public-health standpoint.

Concepts of tropical medicine frequently overemphasize those diseases that are exotic in the more highly developed temperate regions and tend to minimize the role of cosmopolitan diseases such as tuberculosis, pneumonia and syphilis, which in the tropics are major causes of mortality and morbidity. That the criteria for defining a disease as tropical are often rather arbitrary is indicated by the fact that certain diseases so regarded have, in the past, been prevalent in the temperate zones Thus, malaria, acknowledged to be the most important tropical disease, was prevalent in the northern United States during the 19th century. Samuel Pepys and Daniel Defoe vividly described the 17th-century outbreaks of plague in England and France. In the 18th century, outbreaks of cholera, dengue and yellow fever occurred in Boston and Philadelphia.

Tropical medicine, as taught in medical schools, includes a few diseases prevalent only in tropical areas, and in addition considers a larger group of entities that are exotic in the more developed countries in temperate regions In practice, the specialty of tropical medicine deals with all diseases prevalent in the tropics and with the complex interrelationships between man and disease in the tropical environment This involves knowledge of human ecology, of the various sociologic, economic, anthropologic, and demographic factors affecting the distribution of disease, as well as knowledge of general medicine and its ancillary sciences

Development of the Specialty of Tropical Medicine.—The evolution of the science of tropical medicine has been a corollary of progressive colonization and commercialization of the tropics Measures originally developed to safeguard the health of travellers and colonial officials in tropical areas were modified and directed toward improving the health of the native populace. Preventive medicine with reference to the individual was supplanted by the concept of tropical public health with emphasis on improvement of health standards of the community

The 50-year period from 1875 to 1925 witnessed the elucidation of the causative agents and modes of transmission of many tropical diseases Alphonse Laveran's discovery of the parasites of malaria in the blood of man preceded by 17 years the report of Ronald Ross in 1897, describing malaria oocysts in anopheline mosquitoes. In 1878 Patrick Manson had focused attention on mosquitoes with the observation that the larval stages of the nematode parasite, *Wuchereria bancrofti*, the cause of tropical elephantiasis, develop in this insect. Walter Reed and his coworkers demonstrated mosquito transmission of yellow fever in 1901. These pioneering achievements at the turn of the century were followed by the discovery of the trypanosomes which produce African sleeping sickness and Chagas' disease, with the demonstration that tsetse flies transmit the former, and reduviid bugs, the latter entity. Kala-azar and oriental sore were established as infections with species of protozoa belonging to the genus *Leishmania* and sandflies were incriminated as vectors The complex and biologically interesting life cycles of various trematodes para-

sitic in man were defined These flat worms, which produce serious diseases including schistosomiasis, require a fresh-water snail as the first intermediate host. Certain species require an additional host, such as a fish or crab, before the parasite becomes infective for man.

Later, the aetiological agents of additional diseases were discovered It seemed that the list of important tropical infections of man produced by the helminths, protozoa and bacteria was nearing completion by mid-20th century. It was probable, however, that a number of diseases caused by filterable viruses or rickettsiae, as yet unknown, remained to be defined

The development of methods of prophylaxis and treatment followed the advance of medical science in general Effective vaccines were prepared, of these, yellow fever vaccine developed in the laboratories of the International Health division of the Rockefeller foundation is an outstanding example Notable achievements in chemotherapy were made Chloroquine and chlorguanide largely replaced quinine in the treatment of malaria Vermifuges were developed for most of the intestinal helminths Organic compounds were synthesized for the therapy of amoebiasis, schistosomiasis, kala-azar, trypanosomiasis and filariasis Certain sulfonamide compounds were found to be highly effective in the treatment of bacillary dysentery The advent of the antibiotics provided specific agents for the therapy for the rickettsial diseases, as well as invaluable aids in the treatment of yaws, plague, tropical ulcer and amoebiasis.

Measures to combat the vectors of tropical disease have required the combined efforts of scientists possessing a variety of skills. Brief mention of certain aspects of the evolution of techniques used in the control of malaria will serve to illustrate the debt of tropical public health to its ancillary sciences. The pioneering mosquito-control programs instituted in 1901 by the army surgeon W. C. Gorgas and J. A. LePrince in Havana, and by Malcolm Watson in the Federated Malay States, focused attention on drainage and the engineering aspects of the problem. Entomological studies demonstrated that different anopheline mosquitoes vary in their ability to transmit malaria. The habits and breeding requirements of the important vectors were defined With this information mosquito control was directed against individual species and the widely accepted principle of "species sanitation" evolved Mosquito larviciding programs, employing first petroleum products and later Paris green, were used effectively. Biological control techniques, as for example the alteration of the salinity of a mangrove swamp, found practical application. Modification of agricultural practices such as the introduction of intermittent irrigation of rice fields proved of value An extreme example of the complexities of species sanitation was encountered in the cacao plantations of Trinidad, where *Anopheles bellator* was found to breed in collections of water in the leaves of epiphytes growing on the plantation shade trees; control hinged on the development of a selective herbicide for the epiphytes. The introduction of DDT (dichloro-diphenyl-trichloroethane) during World War II, and the demonstration of its residual toxicity for adult mosquitoes when sprayed on surfaces, focused attention on destruction of mosquitoes in houses by the use of residual sprays, and stimulated research on the development of insecticides With all these techniques available, consideration of "species eradication" became feasible. (For "suppressant" drugs used in the treatment of malaria, *see* MALARIA.)

Problems in Control.—Climatic conditions in the tropics directly affect the distribution of disease by providing habitats optimal for parasitic agents or their vectors Little scientific information was available at mid-20th century regarding the direct effect of the hot climates on native peoples, although the indirect effects are obviously manifold. With the exception of alluvial deposits, the soils of the humid tropics are leached and generally of low fertility. In sparsely populated areas native agriculture is therefore migratory in type, and housing and sanitation accordingly primitive. In densely populated areas, intensive cultivation and fertilization of the soil is mandatory. Lacking other sources of fertilizer, the use of human excrement as manure, with its accompanying health hazards, then becomes a biologic necessity Nutritional deficiencies in the tropics are a reflection of climatic, as well as of economic and sociologic factors. Native diets generally are deficient in animal protein and certain minerals and vitamins. In densely populated areas, a higher yield of food per unit of land is usually obtainable from agriculture than from animal husbandry; in addition, climatic conditions adversely affect the raising of livestock, and facilities for transportation and refrigeration of animal products are not available

It has long been recognized that a malarious community is an impoverished community This statement is equally applicable to other endemic chronic tropical diseases The extent of mutually interrelated and self-perpetuating poverty, disease and ignorance in many tropical areas is almost beyond the comprehension of an individual accustomed to life in the developed temperate regions In 1951 it was authoritatively estimated that the annual income per person in southeast Asia was about $30, and in south Asia, $55. The average life expectancy in these areas was in the neighbourhood of 30 years, and approximately one-half of the children died before attaining 10 years of age Such regions lacked both the trained personnel and the financial resources necessary for the application of modern techniques of environmental sanitation

To correct these deficiencies, assistance on an international scale was required. The activities in the International Health division of the Rockefeller foundation, initiated in 1914, provided a successful example of this type of endeavour The expenditure of relatively small sums of money on the training of personnel and for the control of diseases such as yellow fever, hookworm and malaria has benefited mankind throughout the tropics

International public health also received great impetus from the formation of the World Health organization At the first World Health assembly in 1948 malaria was one of the diseases selected for immediate attention Malaria control teams formed by WHO and composed of scientists of varying nationalities, began operation in many countries Other problems were attacked in a similar manner The rapid development of international co-operation in the field of tropical public health following World War II reflected increasing acceptance of the view that alleviation of the human misery in the underdeveloped regions is an essential step toward attaining a stable and peaceful world

Improvement of health standards in the tropics in the absence of the concomitant development of education, agriculture and industry may paradoxically augment, rather than alleviate, human misery In terms of natural resources, many areas are becoming over-populated to an alarming degree. The population of Java increased by 10,000,000 during the decade ending in 1940, at which time the population density was about 1,000 per square mile. By 1950 the population of India was increasing by approximately 6,000,000 per year, which in terms of food meant an additional annual requirement of 1,000,000 tons In Puerto Rico the accelerated population growth associated with the introduction of environmental sanitation was strikingly demonstrated The population in 1948 was increasing at a rate that, if maintained, would result in a doubling of the number of people on this small island in 24 years No brief can be held for denying underdeveloped regions the benefits of tropical medicine On the other hand, knowledge that its successful practice will eliminate infectious disease as a check on the growth of population cannot be disregarded.

TROPICAL STORMS. Severe cyclonic disturbances of the atmosphere in low latitudes are called tropical storms. In the western Atlantic they are known regionally as hurricanes and in the western Pacific as typhoons. It is the fury of the weather associated with tropical storms that distinguishes them from the many minor weather disturbances that more commonly produce periods of greater than normal rainfall in the tropics. They are, roughly, 50 to 500 mi. in diameter.

Description.—Tropical storms frequent the tropical oceans between latitudes of approximately 5° and 30° of both hemispheres. Their characteristics are not entirely uniform, but depend somewhat on age, size, and latitude of the storms They are cyclonic whirls (*See* CYCLONE.) The winds near the centre form an almost circular vortex, with a slight inward motion toward the centre near the ocean surface. As a result of the effect of the earth's rotation (*see* MOTION, LAWS OF), the rotation of the vortex is clockwise in the southern hemisphere and counterclockwise in the northern

A cyclonic whirl is called a hurricane or typhoon if the surface winds exceed 75 m.p.h (Beaufort force 12) The area covered by such high winds may have a diameter of only 10 mi when the storm is in its early stage. In fully grown storms the diameter is rarely less than 50 mi. and may attain 150 mi The diameter of the entire area affected in some measure by a large storm may exceed 500 mi Even the largest tropical storms, however, have an area which is only one-half or less the area covered by the average cyclones of middle and high latitudes. An outline of the wind and weather distribution connected with a mature storm is given in fig. 1.

Winds.—While the areal extent of tropical cyclones is small compared with storms outside the tropics, the violence of the weather within the disturbed zone is usually far greater. This is the most spectacular fea-

ture of tropical storms Sustained winds in excess of 100 m p h. are common near the centre, and winds higher than 150 m p h. have occurred. Since mature storms usually lie within the broad easterly trade winds, the distribution of the hurricane winds around the centre tends to be asymmetrical On the poleward side of the cyclones the trade winds reinforce the wind field produced by the disturbances themselves;

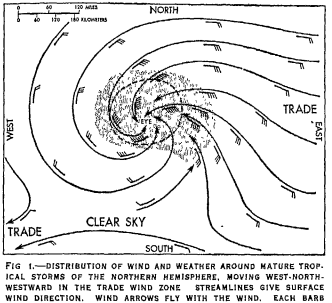

FIG 1.—DISTRIBUTION OF WIND AND WEATHER AROUND MATURE TROPICAL STORMS OF THE NORTHERN HEMISPHERE, MOVING WEST-NORTH-WESTWARD IN THE TRADE WIND ZONE STREAMLINES GIVE SURFACE WIND DIRECTION. WIND ARROWS FLY WITH THE WIND. EACH BARB REPRESENTS TWO BEAUFORT FORCES. DASHED LINE SURROUNDS AREA WITH WINDS HIGHER THAN BEAUFORT FORCE 12 SHADED AREA OUTLINES REGION OF HEAVY RAINFALL

on the equatorward side they counter this wind field. Thus, the high winds around centres located in the trades extend a far greater distance poleward than equatorward. In a mature storm of the northern hemisphere, for instance, hurricane winds may extend for only 30 to 40 mi. south of the centre but they will occur for twice that distance to the north.

Pressure.—Coincident with the rise of wind speed from the edge of the storm inward, the atmospheric pressure as measured by the barometer drops Tropical storms are low pressure centres, and the lowest sea level pressures observed on earth occur in or near the eye of hurricanes Up to 1946, the lowest official pressure on record was registered at Key West, Fla , on Sept. 2, 1935, with a reading of 26 35 in of mercury. This low pressure existed in a storm of small diameter, indicating that the intensity of a tropical storm does not depend on its areal extent There are many other instances to substantiate this conclusion The drop of the barometer can be exceedingly rapid as the winds increase to hurricane strength, and its rise after passage tends to be equally rapid

Clouds and Rainfall.—The interior of a tropical storm is filled with a great mass of cumulonimbus clouds (*see* CLOUD) from which heavy rain is falling Only in the eye is there a lightening of the clouds; here many times the sky is even entirely clear. The distribution of the rainfall around the central core often is not symmetrical, paralleling the winds During the formation of a storm cumuliform clouds and showers

[illegible] intensity. Precipitation in excess of 20 in. in one day has occurred on several occasions along the southern coast of the United States and in various parts of the tropics. At Baguio in the Philippines 42 in fell within 24 hr in 1911 For a rough estimate, a rainfall of 10 to 15 in. should be expected during the passage of a fully developed cyclone over coastal regions.

Dangers to Flying.—The dangers caused by turbulence as well as other dangers to flying in and near tropical storms are not quite so prohibitive in most instances as was supposed prior to 1940 After 1944, military bombing aircraft have carried out regular reconnaissance flights in tropical cyclones at a height of about 1,000 ft or less. Most missions succeeded in flying through and around the centres, spending at times several hours in the zone of very rough weather Others have flown over hurricanes at great heights It appears that most dangerous clouds can be topped at 30,000 ft and occasionally at much lower elevations.

Sequence of Events at Fixed Location.—Young, developing disturbances will give little or no advance indication of their arrival, except to the meteorologist who has wind measurements from the upper parts of the atmosphere at his disposal.

A mature cyclone is preceded by a distinct ocean swell with a frequency two or four times less than that of normal waves In the Gulf of Mexico, for example, waves normally reach the shore about every four to five seconds The presence of a hurricane may be suspected if they arrive only every 12 to 15 sec and if the swell is correspondingly higher At sea, moreover, the direction of the swell indicates the direction in which the storm is located, since the swell travels outward from the central area It can precede the centre by 500 mi. and more, a great distance compared with the diameter of the hurricane winds

The drop of the barometer often does not begin until 12 hr before the arrival of the storm centre. Appearance of a sheet of cirrus clouds (*see* CLOUD), gradually thickening, frequently supplies an earlier warning. In addition, the inhabitants of the tropics often rely on other abnormalities of the local weather, such as brilliant, red sunsets and winds from unusual directions, as precursory signs of a cyclone None of these indications are entirely reliable, however, and may fail badly. On Sept. 13, 1945, a hurricane of great intensity was approaching the southeastern Bahamas. Nevertheless, the fishermen of South Caicos island went out in their boats. They did not believe that there was a hurricane because the usual warning signs were missing. More than 50 of them drowned.

The arrival of the storm area itself begins with a gradual picking up of the wind and increasing gustiness, followed by a thickening of low clouds in the sky and intermittent squally showers. Sometimes the main wall of cumulonimbus clouds can be seen approaching in the distance It is called the bar of the storm

When a storm is observed from a point that is not on the path of the centre itself, it will be noted that the hurricane winds gradually change

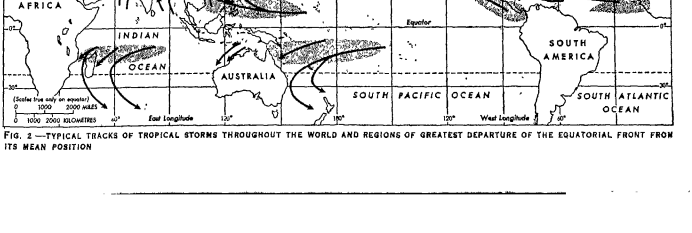

FIG. 2.—TYPICAL TRACKS OF TROPICAL STORMS THROUGHOUT THE WORLD AND REGIONS OF GREATEST DEPARTURE OF THE EQUATORIAL FRONT FROM ITS MEAN POSITION

direction. They will not let up materially, however, until the cyclone passes Should the eye travel over the observation point, however, it will be noted that the winds drop from hurricane strength to light breezes within a few minutes. At the same time the rain ceases and the clouds lighten. After passage of the eye the winds and the precipitation resume with full force, but the winds come from the opposite direction

The duration of the hurricane winds depends on the size of the storm and its rate of movement If the high winds extend over 100 mi and the storm moves 20 m.p.h., then the gales will last for ten hours If the cyclone advances at 15 m.p.h., the winds will last for twice that, seven hours. The same consideration applies to the eye The central calm may remain for only a few minutes or stay for one to two hours

Origin.—The development and maintenance of any vortex of the dimension of a tropical storm depend on the effect of the earth's rotation (*see* METEOROLOGY) As the component of this rotation is zero on the equator, tropical cyclones cannot develop in its immediate vicinity. Areas of strong squalliness and heavy rainfall appear near the equator, but tropical storms have not been observed between latitudes 5° N and S. On the poleward margin of the tropics, conditions favourable for the development of tropical cyclones occasionally exist even beyond latitude 30° Formation between latitudes 20° and 30° is fairly common, especially in the western Atlantic ocean and in the Gulf of Mexico.

All tropical storms develop over water Long before the turn of the 20th century some authors drew attention to the fact that most of them develop along a narrow zone of air convergence, where the trades of both hemispheres meet This zone, which girdles the globe, has been variously called doldrums, intertropical front and equatorial front. It is not of uniform strength around the globe, and it changes its position and intensity with the seasons of the year, following the sun with a lag of two to three months The equatorial front penetrates to about latitude 15° N between July and October and to latitude 10° to 15° S. from January to March or April These months, then, represent the principal cyclone seasons of the respective hemispheres In the northern hemisphere, the peak month of activity usually is September

The distance by which the equatorial front moves away from the equator in the course of a year is not uniform around the globe but is greatest in the regions indicated in fig. 2 The formation of tropical storms is most frequent in those places where the zone deviates far from the equator Where there is little or no seasonal variation of its position cyclonic developments are rare or nonexistent. The zone appears in the transition periods between summer and winter in the Arabian sea and the western part of the Caribbean sea. Over those parts of the tropical oceans, therefore, the cyclone frequency is greatest about June and October, with a lull in midsummer There is also a tendency toward two peaks of cyclone activity in the Bay of Bengal

Tropical storms can develop also in the absence of the equatorial front, although they do so less frequently The storms of the western North Atlantic and the Gulf of Mexico are the outstanding examples of formation without equatorial front However, cyclonic development will not take place near the equatorial front or near other disturbances of the tropics, unless a broad-scale atmospheric circulation pattern is present in the low and high atmosphere that is favourable for formation. The high atmospheric observations taken over the oceans during World War II have shown that tropical weather is greatly dependent on the atmospheric flow in middle latitudes In order to predict the formation of a tropical storm in the West Indies region, for instance, a weather forecaster must have knowledge of weather conditions over all of the North Atlantic ocean and the United States, besides the information as to conditions over the tropics themselves.

Those regions of the earth where tropical storms form principally are shaded in fig. 2 The greatest frequency should be found over those parts of the tropical oceans where the equatorial front is strong and has large seasonal departures from its average position and where, moreover, the average atmospheric flow in middle and high latitudes is favourable. In the western North Pacific ocean these conditions are fulfilled to a higher degree than anywhere else. On the average, about 20 tropical storms form in that area each year. Although statistics are lacking, the cyclone frequency of the South Indian ocean is thought to be almost as high. Compared with these large areas, other hurricane areas of the world have few storms In the western North Atlantic, the Caribbean, and the Gulf of Mexico the mean annual frequency is about six. The deviations from this average, however, are very large. In 1933, 21 tropical cyclones appeared in the area just mentioned; in 1929 and 1930 there were only 2 each The South Atlantic is the only ocean where tropical storms are unknown. The equatorial front does not penetrate far enough southward

Movement.—Within the tropics, storms that have attained maturity usually drift westward with the prevailing trade wind. While the speed of the winds within the disturbances frequently exceeds 100 m.p.h., the rate of movement of the disturbances themselves is about 15 m.p.h. on the average It may deviate, however, by five m.p.h or more from this mean figure in individual cases Besides the westward movement there is also a tendency for most storms to approach the poleward limit of the tropics gradually. When they reach this limit near latitude 30°, they leave the tropical easterlies and come under the influence of the prevailing westerlies of higher latitudes Their direction of motion then reverses and they are said to recurve. After the recurvature they drift eastward while continuing to approach the high-latitude regions. During the recurvature the speed of the cyclones is lowest, and they frequently become almost stationary for 12 to 24 hr After recurving, their speed increases rapidly and they may be moving at 50 to 60 m.p.h when they reach the polar zone

The general path of tropical storms just outlined has a large number of exceptions because of constant changes of the broad-scale atmospheric currents and their effect on the tropics Weather observation networks extending over large portions of the globe and experienced forecasters are necessary to predict the path of individual storms These predictions become especially difficult when a storm lies between the broad-scale easterlies and westerlies (*see* WINDS, GENERAL CIRCULATION OF) so that it is temporarily controlled by neither of these currents

End of Storms.—Dissipation of tropical storms over the tropical oceans is rare. Most disturbances eventually enter the middle and high [illegible] pation is far slower than over rugged country

Damages.—The loss of life and property on tropical islands and coastal areas of continents is caused by the direct and indirect effects of the high winds and the excessive rains.

Winds.—The pressure exerted by the air on solid objects, for instance houses, is proportional to the square of the wind speed. Thus an increase of the wind from 40 to 50 m.p.h. produces far less added danger to buildings than a rise from 90 to 100 m.p.h. Moreover, the resistance capacity of many types of structures appears to become exhausted rapidly when the winds exceed 75 to 80 m.p.h. In industrial and city areas, the danger to industrial and electrical installations is great. Short circuits in the midst of a raging storm and the explosion of gasoline tanks have led to uncontrollable fires Much damage also results from the impact of flying debris

Storm Waves—Some of the most disastrous losses of life and property have been caused by a sudden rising of the ocean and widespread inundations of low-lying, poorly protected coastal areas. The abrupt increase of the water level, referred to as the storm wave, is caused by the action of the wind on the water. The storm wave appears so quickly and is carried with tremendous force so far inland that often there is no time for the coastal inhabitants to rescue themselves or their belongings

Rainfall—The heavy rainfall often accompanying tropical storms frequently causes landslides in mountainous and hilly areas Because of the great and sustained intensity of the precipitation, the runoff of the water is extreme and produces rapid and excessive rises of the water level of the rivers along which the human settlements and most valuable agricultural activities are usually concentrated.

The damaging power of tropical storms is not confined to the tropics. Occasionally, storms moving up against Japan, China and the northeastern coast of the United States have struck with a violence equal to that of storms within the lower latitudes.

Storm Warning Services.—Forecasting of the appearance of tropical storms was attempted long before the start of the 20th century. These activities were begun largely by the Society of Jesus whose members developed a high forecasting standard, notably in the West Indies and the Philippines With the gradual *expansion of governmental* weather services after 1900, the forecasting work passed more and more into official hands, aided also by the *military weather services during* World War II. From 1935, for instance, the United States weather bureau has maintained special hurricane forecast centres which advise the public concerning the position, intensity, and probable movement of hurricanes and indicate what type of precautions are necessary.

(*H. RR.*)

TROPIC BIRD, a genus (*Phaethon*) of sea birds of the order Steganopodes with webbed feet and long forked tails. The flight is by rapid strokes of the wing. The yellow-billed tropic bird (*P. flavirostris*) has the widest range, inhabiting the Atlantic, Indian and Pacific oceans, and breeding on trees in various islands, including the Bermudas. It lays a single pinkish-white egg, mottled with brownish-purple. The plumage is white, with black patches. *P. aethereus* is larger and lacks the yellow bill. It does not occur in the western part of the Indian ocean. *P. rubricauda* is still larger and has a red tail and a roseate tinge to the rest of the plumage. It is confined to the Pacific and Indian oceans. The tropic birds form the family *phaethontidae*.

TROPINE (Tropanol), $C_8H_{15}NO$, the amino-alcohol portion which is formed, together with tropic acid, when the ester linkage

in atropine (*q v.*) or hyoscyamine is hydrolyzed with acids or alkalies. It forms white, hygroscopic crystals melting at 63° C and does not rotate the plane of polarized light Its synthesis (Richard Willstatter, 1901) furnished proof of the structure of the parent alkaloids Tropine has no medical uses but is employed in the manufacture of homatropine (*see* ATROPINE) and similar mydriatic agents. Tropine is closely related to ecgonine, the basic portion of cocaine (*q v*). (L. F St.)

TROPISM, a term introduced by plant physiologists by 1835, grew to designate the bending of a plant in relation to some definite stimulus like that furnished by gravity (geotropism) or light (phototropism) The turning continues until the plant is so oriented that symmetrically placed parts are equally stimulated As outlined in ANIMAL BEHAVIOUR (*q v*), tropism has retained essentially this same meaning except that it also includes the orientation of sessile animals Jacques Loeb initiated and developed the transfer of concepts centring about tropisms from plant physiology to animal behaviour. He believed that, despite the more complicated reaction system of animals, plants and animals behave fundamentally alike. The tropism theory of orientation as applied to higher animals postulates that these bilaterally symmetrical organisms give a quantitatively different reaction of the locomotor appendages or tissues on opposing sides in direct proportion to the strength of stimuli received by the corresponding receptors After being oriented, a motile organism is held on its path by balanced thrusts of its locomotor apparatus, much as a rudderless boat is guided and propelled by laterally operated oars or by a tail-like sculling oar at the stern." This tropism theory of oriented response—also called the muscle-tonus theory—is an incomplete explanation of oriented behaviour. The term tropism has been expanded to include all aspects of unlearned, reflex actions of whole organisms that appear to result from the direct interaction of physical forces in the environment with physiological processes within the organism. Taxes (taxis, singular), as well as tropisms in the restricted sense, were called tropisms with the implication that the reacting organism is mechanically forced to behave as it does Loeb skilfully developed this mechanistic conception of behaviour; after 30 yr of study he wrote (1918). "Motions caused by light or other agencies appear to the layman as expressions of will and purpose on the part of the animal, whereas in reality, the animal is forced to go where carried by its legs For the conduct of animals consists of forced movements." (Jacques Loeb, *Forced Movements, Tropisms, and Animal Conduct*, J B. Lippincott Co., 1918.) According to this theory, behaviour is not primarily adaptive, the male moth is not trying to find a mate, and fishes do not will to swim upstream, they are mechanically forced to do so. Loeb applied this interpretation very widely and (1918) suggested that, with the enlargement resulting from memory, the tropism theory might include human conduct Largely because of its close association with unproved theories, some students avoid the word tropism entirely; others use it descriptively, without theoretical implications, for orientation reflexes of sessile organisms

TROPPAU: *see* OPAVA

TROPPAU, CONGRESS OF, a conference of the allied sovereigns or their representatives to discuss a concerted policy with regard to the questions raised by the revolution in Naples of July 1820. At this congress, which met on Oct. 20, 1820, the emperors Alexander I of Russia and Francis I of Austria were present in person; King Frederick William III of Prussia was represented by the crown prince (afterward Frederick William IV). The three eastern powers were further represented by the ministers responsible for their foreign policy: Austria by Prince Metternich, Russia by Count Capo d'Istria, Prussia by Prince Hardenberg. Great Britain, on the other hand, which objected on principle to the suggested concerted action against the Neapolitan Liberals, sent no plenipotentiary, but was represented by Lord Stewart, ambassador in Vienna. France, too, had given no plenary powers to her representatives.

In a series of conferences—to which the representatives of Great Britain and France were not admitted, on the excuse that they were only empowered to "report," not to "decide"—was drawn up the famous preliminary protocol signed by Austria, Russia, and Prussia on Nov 19 The main pronouncement of the "Troppau protocol" is as follows "States which have undergone a change of government due to revolution, the results of which threaten other States, *ipso facto* cease to be members of the European Alliance, and remain excluded from it until their situation gives guarantees for legal order and stability. If, owing to such alterations, immediate danger threatens other States the powers bind themselves, by peaceful means, or if need be, by arms, to bring back the guilty State into the Great Alliance."

No effort was made by the powers to give immediate effect to the principles enunciated in the protocol; and after its promulgation the conferences were adjourned, it being decided to resume them at Laibach in the following January (*see* LAIBACH, CONGRESS OF).

TROSSACHS, THE (Gaelic, "the bristled country," a crude allusion to its physical features), a defile in the southwest of Perthshire, Scotland It is a narrow, beautifully wooded glen, of no great depth, extending from Loch Achray to Loch Katrine, and continued thence by a strip on the northeastern shore to a point above the now submerged Silver Strand opposite to Ellen's Isle—a total distance of 2¼ mi It is situated 8 mi. W of Callander and 5 mi N of Aberfoyle, between the steep green slopes of Ben Venue (2,393 ft) on the southwest and the precipitous crags of Ben A'an (1,326 ft) on the northeast. The region has been famous for its beautiful scenery since the appearance of Sir Walter Scott's *The Lady of the Lake* and *Rob Roy*, with their vivid descriptive passages.

TROTSK (Gatchina, Krasnogvardeisk), a town in the Leningrad region of the Russian S.F S.R., in 59° 33′ N., 30° 7′ E, situated among lakes and pine forests on the Izhora river It was originally a Swedish estate presented by Peter I to his sister. Catherine II gave it to Prince Orlov, and a castle and grounds were constructed by the Italian architect, Rinaldi, in 1770. Later it became a military camp, and, toward the end of the 18th century, a summer residence of the tsars. Near the palace is the priory built by Lvov in 1797 for the Knights of Malta, of which order Paul I was grand master. In the civil wars following 1917, Gatchina was used as a base by L G Kornilov and A. F Kerensky in 1917, and N N Yudenich in 1919. In 1923 it was renamed after Trotsky Later it was renamed Krasnogvardeisk

See *Guide to the Soviet Union* (Moscow, 1925) in English

TROTSKY, LEV DAVIDOVICH (1879–1940), Russian politician, whose real name was Bronstein, was born near Elizavetgrad, the son of middle-class Jews. He was educated at the Peter and Paul *Real Schule* in Odessa and at the university of that town. He was arrested as a revolutionary in 1898, and soon after exiled to eastern Siberia. In 1902 he escaped to England by means of a forged passport in the name of Trotsky (which name he used thenceforward). In London, despite his youth, he soon became an important member of the small body of social democrats which included Plekhanov and Lenin He collaborated with the latter and others in the publication of *Iskra* (Spark), the most famous of the Russian revolutionary newspapers. In 1905 he returned to Russia, was elected a member of the St Petersburg Soviet of Workers' Deputies and was chairman of the meeting at which the whole soviet was arrested He was exiled to Tobolsk but escaped immediately on his arrival in Siberia and went to Vienna, where he worked for the *Arbester Zeitung* and the *Pravda*. He also worked in a chemical factory. In 1910 he attended the Social Democratic congress at Copenhagen, defending a position of his own, midway between that of the bolshevists and that of the menshevists In 1913 he was in Constantinople as a war correspondent. The following year found him in Zurich and Paris, taking part in the publication of a revolutionary paper. He wrote a book on the origins of World War I, published in German, and was sentenced to eight months'

imprisonment But he opposed the War not only in Germany but in the Allied countries, and in 1916 was expelled from France. He was arrested by the Spanish authorities on crossing their frontier but was allowed to leave for America, where he edited the Russian revolutionary *Novy Mir* (The New World).

When the revolution broke out in March 1917 Trotsky's friends and subscribers to the paper collected the money for his journey to Russia He was, however, arrested by the British authorities and taken ashore at Halifax, where he was interned until the Russian Provisional government asked for his release. He arrived in Petrograd soon after Lenin He was the leader of a small party of social democrats and soon joined the Bolsheviks but did not actually become a member of the Bolshevik party until July 1917, when he was arrested for being concerned in the rising which took place in that month. He played a part hardly less important than that of Lenin in organizing the Bolshevik revolution in 1917 and became People's Commissar for foreign affairs in the new Soviet Government.

Trotsky was the most important figure in the Russian delegation during the negotiation of the Brest-Litovsk peace treaty. Believing that the moral effect of the revolution had already been such that the Germans would be unable to force their troops to move against Russia, he met the oppressive German demands with the statement that Russia would not sign a treaty on such terms but that she considered the War to be at an end and would demobilize her troops. The Germans thereupon continued their advance. Lenin had disagreed with Trotsky, considering that the risk was too great since at that time the Germans could easily have taken Petrograd After a series of debates, Trotsky announced that he now sided with Lenin and by a majority of one it was decided to sign an even more unfavourable treaty than that previously refused Trotsky was replaced by Chicherin as Commissar for foreign affairs and took over the Commissariat of war. In spite of opposition he made great use of officers of the old régime in organizing a new Red army The results obtained were used to justify the employment of "bourgeois" technical experts in the factories When he had made a new army that showed itself superior to those of the Whites his energies were used in preventing the complete collapse of the railways In 1920 he organized as "labour armies" the troops that were not needed for war.

Until the introduction of the new economic policy Trotsky urged industrial conscription, but wholeheartedly accepted the new policy which made such measures impossible During the Polish war of 1920, he opposed the disastrous advance on Warsaw but was overruled by Lenin In the autumn of 1923 he adopted a position that made it possible for the "old guard" of the Communist leaders to accuse him of canvassing for the support of the younger men. He was violently attacked by Stalin, Zinoviev and others. Many of his friends were shifted from their posts and he himself was on the way to the Caucasus to take a cure, when Lenin died. Throughout the revolution the names of Lenin and Trotsky had been coupled and the death of the one seemed to leave the other alone in the field. This was not really so. Seniority counts for much in the Communist party and the older leaders never forgot that Trotsky had only joined the party in 1917 The campaign to discredit him was continued. He lost his post as Commissar of war. When he returned from the Caucasus he was given work of small political significance, being made head of the committee for the development of electric power in Russia In 1925 he resigned from this post and was made head of the Central Committee for Concessions. In Nov 1927 he was expelled from the Communist party for his anti-party activities, and in Jan. 1928 he was exiled to Vierne in Turkestan. He was subsequently banished and went to Constantinople (1929).

In 1936 he made his home in Norway; in Jan. 1937 he went to live in Mexico He was (1936) accused of joining Zinoviev and Kamenev in a plot to murder Stalin but emphatically repudiated the charge. On Aug. 20, 1940 he was attacked in his suburban home at Mexico city by a "friend" whom the exile's intimates described as a Stalinist agent. He died the next day. (A.R.A.; X.)

TROTZENDORFF (or TROCEDORFIUS), **VALENTIN FRIEDLAND** (1490–1556), German educationist, called Trotzendorff from his birthplace, near Gorlitz, in Prussian Silesia, was born on Feb. 14, 1490, of parents so poor that they could not keep him at school Nevertheless he was sent to study at Görlitz, and became a schoolmaster there He resigned presently to study under Luther and Melanchthon, supporting himself meanwhile by private teaching He then became master in the school at Goldberg in Silesia, and in 1524 rector There he remained three years, when he was sent to Liegnitz He returned to Goldberg in 1531 and began that career which has made him the typical German schoolmaster of the Reformation period He made his best elder scholars the teachers of the younger classes, and insisted that the way to learn was to teach He organized the school in such a way that the whole ordinary discipline was in the hands of the boys themselves. Every month a "consul," twelve "senators" and two "censors" were chosen from the pupils, and over all Trotzendorff ruled as "dictator perpetuus" One hour a day was spent in going over the lessons of the previous day. The lessons were repeatedly recalled by examinations, which were conducted on the plan of academical disputations. Every week each pupil had to write two "exercitia styli," one in prose and the other in verse, and Trotzendorff took pains to see that the subject of each exercise was something interesting. The fame of the Goldberg School extended over all Protestant Germany, and a large number of the more famous men of the following generation were taught by Trotzendorff. He died on April 20, 1556

See Herrmann, *Merkwürdige Lebensgeschichte eines berühmten Schulmanns, V. F. Trotzendorffs* (1727); Frosch, *V F. Trotzendorff, Rektor zu Goldberg* (1818); Pinzger, *V F Trotzendorff* (with the Goldberg portrait, and a complete list of his writings, 1825), Koehler, *V F Trotzendorff, ein biographischer Versuch* (1848), G Bauch, *Valentin Trozendorf und die Goldberger Schule* (1921). The biographical facts appear to be derived from a funeral or memorial oration delivered by Balthasar Rhau in the university of Wittenberg on Aug 25, 1564, and published in an edition of Trotzendorff's *Rosarium* (1565).

TROUBADOUR, the name given to the poets of southern France and of northern Spain and Italy who wrote in the *langue d'oc* from the 12th to the 14th centuries. In Provençal the word is spelt *trobaire* or *trovador*, and is derived from the verb *trobar*, to find, or to invent (Fr *trouver*) The troubadour was one who invented, and originally improvised, poetry, who "found out" new and striking stanzaic forms for the elaborate lyrics he composed.

The earliest troubadour of whom anything definite is known is Guilhem IX. (b 1071), count of Poitiers and duke of Aquitaine, whose career was typical of that of his whole class, for "he knew well how to sing and make verses, and for a long time he roamed all through the land to deceive the ladies" The high rank of this founder of the tradition was typical of its continuation; by far the largest number of the troubadours belonged to the noble class, while no fewer than 23 of their number were reigning princes Among them is a king of England, Richard I., who is believed to have written in *langue d'oil* as well as in *langue d'oc*, and who has left at least one canzo, that written in prison, of remarkable beauty. These noble troubadours were distinguished by their wealth and independence from those who made their song their profession, and who wandered from castle to castle and from bower to bower. But whether dependent or independent, the poets exercised a social influence paralleled by nothing before it in the history of mediæval poetry They had great privileges of speech and censure, they entered into questions of politics, and above all they created around the ladies of the court an atmosphere of cultivation and amenity which nothing had hitherto approached. The troubadour was occasionally accompanied by an apprentice or servant, called a *joglar*, who provided a musical setting for the poet's words, and sometimes sang the songs

There were recognized about 400 troubadours, during the whole period in which they flourished, from Guilhem de Poitiers down

to Guiraut Riquier (*c.* 1230–94). Several ms. collections of biographies have been preserved, and from these we gain some idea of the careers of no fewer than 111 of the poets. The principal source of the lives of the troubadours is a collection, by various hands, made towards the middle of the 13th century. Of these Uc of Saint Cyr (*c.* 1200–40), himself a troubadour, was certainly one of the authors. Another, but unreliable, source of information is the *Vies des plus célèbres et anciens poètes provencaux*, published by Jehan de Notredame or Nostradamus, in 1575. Even the numerous genuine biographies are often embroidered with fantastic and whimsical statements which make a severe demand upon the credulity of a modern reader One late troubadour, Rambaud of Orange, left a commentary on his own poems, and Guiraut Riquier one on those of a fellow troubadour, Guiraut of Calanson (1280). This proves the poetry of Provence to have passed early into the critical stage, and to have been treated very seriously by those who were proficient in it This is further shown by the respect with which the Provençal poets are mentioned by Dante, Petrarch and others.

The verse form most frequently employed by the troubadours was the *sirventés*, a term which is earliest met with in the second half of the 12th century. The troubadours also employed the *ballada*, which was a song with a long refrain, not much like the formal ballade of the north of France; the *pastourella;* and the *alba* This last took its name from the circumstance that the word *alba* (dawn) was repeated in each stanza. This was a morning-song, as the *serena*, a later invention, was an evensong The *planh* was a funeral elegy, composed by the troubadour for the obsequies of his protector, or for those of the lady of his devotion. Most interesting of all, perhaps, was the *tenson*, which was a lyrical dialogue between two persons, who discussed in it, as a rule, some point of amorous casuistry, or matters of a religious, metaphysical or satirical nature. The troubadours were essentially lyrical (*see* Provençal Language and Literature).

The biographies of the troubadours, which throw an unparalleled light upon mediaeval literary life, may perhaps be most conveniently treated in connection with the courts at which each group of them flourished. It is in Poitou that we trace them first, where Guilhem, count of Poitiers, who reigned from 1087 to 1127, was both the earliest patron and the earliest poet of the school The daughter of Guilhem X carried on her grandfather's tradition This was Eleanor of Aquitaine, at whose court Bernart of Ventadour rose to eminence. This poet seems to have been the son of a kitchen-scullion in the castle of Ebles II, viscount of Ventadour. Eble, himself a poet, was early impressed by the talents of his serving-boy, and trained him to be a poet. The beautiful wife of Eble, the viscountess Agnes of Montluçon, encouraged the suit of the youthful Bernart, indeed, they had secretly loved one another from their childhood. The poems which this passion inspired are among the most admirable lyrics which have come down to us from the middle ages. The husband at last discovered the intrigue and exiled Bernart from Ventadour. The troubadour took shelter with Eleanor of Aquitaine, who became in 1152 the queen-consort of Henry II. of England, himself a protector of poets

Henry, eldest son of Henry II., was the patron of another eminent troubadour, Bertran de Born, viscount of Hautefort in Perigord Dante saw Bertran de Born in hell, carrying his severed head before him like a lantern, and compared him with Achitophel, who excited the sons of David against their father. This referred to the subtle intrigues by which the troubadour had worked on the jealousy existing between the three sons of the king of England. The death of Prince Henry (1183) produced from Bertran de Born two *planhs*, which are among the most sincere and beautiful works in Provençal literature The poet was immediately afterwards besieged in his castle of Hautefort by Richard Cœur de Lion, to whom he became reconciled and whom he accompanied to Palestine. He grew devout in his old age, and died about 1205.

There were poetesses in the highly refined society of Provençe, and of these by far the most eminent was Beatrix, countess of Die, whose career was inextricably interwoven with that of another noble troubadour, Rambaut III., count of Orange, who held his court at Courthézon, a few miles south of Orange. Rambaut said that since Adam ate the apple no poet had been born who could compete in skill with himself, but his existing lyrics have neither the tenderness nor the ingenuity of those of his illustrious lady-love. The poems of Beatrix are remarkable for a simplicity of form rare among the poets of her age. Marcabrun (*c.* 1129–95), from whose pen some 40 poems survive, was an innovator and a reformer, to him the severity of classical Provençal style is mainly due, and he was one of the first to make use of that complex form which was known as the *trobar clus* He posed as a violent misogynist—"I never loved and I was never loved." Marcabrun expresses great affection for "that sweet poet," Jaufre Rudel, prince of Blaye, whose heart turned, like the disk of a sunflower, towards the Lady of Tripoli. Little else than that famous adventure is known about the career of this ultra-romantic troubadour, except that he went as a crusader to the Holy Land, and that his surviving poems have so mystical a tone that Jaufre Rudel has been suspected of being a religious writer who used the amorous language of his age for sanctified purposes, and whose "Princess Far-away" was really the Church of Christ. Peire d' Alveona (Peter of Auvergne), like Marcabrun, was of mean birth, son of a tradesman in Clermont-Ferrand, but he was handsome and engaging, and being the first troubadour who had appeared in the mountain district, "he was greatly honoured and fêted by the valiant barons and noble ladies of Auvergne" It is believed that Peire's poems were produced between 1158 and 1180. He flourished at the court of Sancho III, king of Castile, and afterwards at that of Ermengarde, viscountess of Narbonne.

It is doubtless owing to the repeated praise which was given by Dante, in the *Inferno* and elsewhere, to Arnaut Daniel that this name remains the most famous among those of the troubadours He was a knight of Riberac, in Perigord, and attached himself as a troubadour to the court of Richard Cœur de Lion. Dante calls Daniel the "smith," the finished craftsman, of language, and it is evident that it was the brilliant art of the Provençal's elaborated verse which delighted the Italian. His invention of forms of verse (*see* Sestina), in particular, dazzled the great Italian. Dante was curiously anxious to defend Arnaut Daniel as being a better artist than his immediate rival, Giraut de Bornelh; critical posterity, however, has reversed this verdict. Giraut laments, in his poems, the brutality of the age and the lawlessness of princes. A troubadour of the same district of south-western France was Arnaut de Mareuil, to whom is attributed the introduction into Provençal poetry of the amatory epistle.

Peire Vidal of Toulouse was the type of the reckless and scatterbrained troubadour His biographer says that he was "the maddest man in all the world" His early life was a series of bewildering excursions through France and Spain At Marseilles he made a mortal enemy of Azalaïs, the wife of Viscount Barral de Baux, from whom he stole a kiss (1180). He committed a thousand follies; among others, being in love with a lady called Louve (she-wolf), the poet dressed himself as a wolf, and was hunted by a pack of hounds in front of the lady's castle Folquet of Marseilles was a troubadour of Italian race, the son of a merchant of Genoa; Dante met Folquet in paradise, and gives an interesting notice of him It is in the *sirventés* of Folquet that critics have seen the earliest signs of that decadence which was so rapidly to destroy Provençal poetry.

Gaucelm Faidit came from Uzerche, in the Limousin. He seems to have been a wandering minstrel of gay and reckless habits, and to have been accompanied by a light-o'-love, Guilelma Monja, who was the object of much satire and ridicule Another troubadour, Raimbaut of Vaquières, passed the greater part of his life at the same court of Montferrat; he devoted himself to the Lady Beatrix, sister of the marquis The most celebrated of the Italian troubadours was Sordello, born at Mantua, at the beginning of the 13th century, who owes his fame to the benevolence of later poets, from Dante to Robert Browning.

We have now mentioned the troubadours who were most famous in their own time, and on the whole modern criticism has

been in unison with contemporary opinion There are, however, still one or two names to be recorded The English historian of the troubadours, Dr. Hueffer, gave great prominence to the writings of Guillem de Cabestanh (or Capestang). This was a knight of Roussillon, who made love to Seremonda, countess of Castel-Roussillon. The lady's husband slew him in a paroxysm of jealousy and, having cut out his heart, had it delicately cooked and served to his wife at dinner When Seremonda had eaten her lover's heart, her husband told her what she had done, and she threw herself out of the window and was killed. Feeling grew so strong that the surrounding nobles, with Alfonso, king of Spain, at their head, hunted the murderer down and killed him. The bodies of the lady and the troubadour were buried side by side, in the cathedral of Perpignan, and became the objects of pilgrimage.

The great cause of the decadence and ruin of the troubadours was the struggle between Rome and the heretics. This broke out into actual war in June 1209, when the northern barons, called to a crusade by Pope Innocent III, fell upon the Albigenses and pillaged Béziers and Carcassonne. Most of the protectors of the troubadours were, if not heretics, indulgent to the heretical party, and shared in their downfall. The poets, themselves, were not immediately injured, but the darkness began to gather round them as the ruin of Languedoc became more and more complete, culminating with the siege of Toulouse in 1218. The greatest name of this period, which was the beginning of the end, is that of Peire Cardenal, of Le Puy. He was protected by Jacme I, king of Aragon, having apparently fled from Narbonne and then from Toulouse in order to escape from the armies of Simon de Montfort. He was the inventor of the moral or ethical *sirventés;* and the author of singularly outspoken satires against the clergy. Another troubadour of this time was Guilem Figueira, the son of a Toulouse tailor, an open heretic who attacked the papacy with extraordinary vigour, supported and protected by Raimon II. Figueira was answered, strophe by strophe, by a female troubadour, Gormonda of Montpellier. The ruin of the southern courts, most of which belonged to the conquered Albigensi party, continued to depress the troubadours, whose system was further disintegrated by the establishment of the Inquisition. The genial and cultured society of Provence and Languedoc sank rapidly into barbarism, and there was no welcome anywhere for secular poets

The last of the French troubadours was Guiraut Riquier (*c* 1230–94), who was born at Narbonne, and found protection at the Spanish court of Alfonso X, the Learned. Riquier, in a *sirventé* of about 1285, gives pathetic expression to his sense of the gathering darkness, which makes it useless and almost unbecoming for a troubadour to practise his art, while of himself he mournfully confesses. "Song should express joy, but sorrow oppresses me, and I have come into the world too late." Guiraut Riquier passed away about 1294, and left no successor behind him.

TROUBETZKOY, AMÉLIE RIVES, PRINCESS (1863–1945), U.S. author, was born on Aug. 23, 1863, in Richmond, Va A popular novelist of the 1890s, she created a literary sensation with her first novel, *The Quick or the Dead?* (1888), which originally appeared in a magazine. The theme, a young widow's conflict between her love for her dead husband and a new lover, considered a taboo subject, caused considerable furor and resulted in enormous sale of her book. Prince Pierre Troubetzkoy (q.v.) was her second husband; the marriage took place at her family's estate in Virginia in 1896 Princess Amélie was also a playwright, poet and essayist. Her writings include: *Seléné* (1905), *Augustine the Man* (1906), *The Golden Rose* (1908), *Pan's Mountain* (1910), *Hidden House* (1911), *The World's End* (1913), *Shadows of Flames* (1915), *The Ghost Garden* (1918), *As the Wind Blew,* poems (1922), *The Queerness of Celia* (1926) and *Firedamp* (1930). She died in Charlottesville, Va., on June 15, 1945

TROUBETZKOY, PIERRE, PRINCE (1864–1936), portrait painter of Russian parentage, was born on April 19, 1864, at Milan, Italy He received his education at the Collegio Calchi Taeggi in Milan and emigrated to the United States in his early thirties. One of his portraits of the British statesman, Gladstone, hangs in the National Gallery at Edinburgh and another in the National Portrait gallery, London Other examples of his work are to be found in Town hall, Dover, England, at the Instituto de Valencia de Don Juan, Madrid, and at the University of Virginia. He died on Aug. 25, 1936

TROUBRIDGE, SIR THOMAS, BART. (*c* 1758–1807), English admiral, was educated at St. Paul's school, London, and entered the navy in 1773 Having seen some service in the East Indies, he was taken prisoner by the French in 1794 In Feb. 1797 he commanded his ship, the "Culloden," at the battle of Cape St. Vincent. In the following July he assisted Nelson in the unsuccessful attack on Santa Cruz He served in the Mediterranean and was created a baronet in 1799, from 1801 to 1804 he was a lord of the admiralty, being made a rear admiral just before his retirement. In 1805 Troubridge was given a command in the east and he went out in the "Blenheim." He was drowned in the wreck of the "Blenheim" off Madagascar, in Jan. 1807

TROUPIAL, a collective name suggested by Ridgway for the American family Icteridae, which includes the North American orioles, meadow larks, cowbirds, grackles and blackbirds and the Central American cacíques

TROUT. The general common name applied to certain species of the family of fishes called Salmonidae and discussed under this heading.

TROUVÈRE, the name given to the mediaeval poets of northern and central France, who wrote in the *langue d'oil* or *langue d'oui.* The trouvères flourished abundantly in the 12th and 13th centuries They were court poets who devoted themselves almost exclusively to the composition and recitation of a particular kind of poetry, the subject of which was some refinement of love

The first appearance of trouvères seems to date from 1137, when Eleanor of Aquitaine, herself the granddaughter of an illustrious troubadour, arrived in the court of France as the queen of Louis VII, speaking the Poitiers dialect of the *langue d'oc.* She was queen for 15 years (1137–52), the period during which the southern influence was strongest in the literature of northern France, and the successive crusades tended to produce relations between the two sections of poetical literature. The northern poets rarely approach the grace and delicacy of the troubadours, while their verse shows less ingenuity and less variety. The earliest trouvères, like Conon de Béthune and Hugues de Berze, in writing their amatory lyrics, were, however, certainly influenced by what troubadours had written.

The poetical forms adopted by the trouvères bore curious and obscure names, the signification of which is still in some cases dubious. The *retruenge* was a song with a refrain; the *serventois* was, in spite of its name, quite unlike the sirventes of the troubadours and had a more ribald character; the estrabot was allied to the *strambotto* of the Italians, and was a strophic form "composed of a front part which was symmetrical, and of a tail which could be varied at will" (Gaston Paris).

The court poetry of the trouvères particularly flourished under the protection of three royal ladies. Marie, the regent of Champagne, was the practical ruler of that country from 1181 to 1197, and she encouraged the minstrels in the highest degree and discussed the art of verse with Chrètien of Troyes Her sister, Aélis or Alice, welcomed the trouvères to Blois; she was the protector of Gautier d'Arras and of Le Châtelain de Coucy. Another Aélis, who became the second queen of Louis VII in 1160, received

Conon de Béthune in Paris, and reproved him for the Picard accent with which he recited his poetry. At the end of the 12th century the refinement and elegance of the court poets was recognized in the north of France by those who were responsible for the education of princes. A trouvère, Gui de Ponthieu, was appointed tutor to William III of Macon, and another, Philippe of Flanders, to Philippe Auguste. The vogue of the trouvères began during the third crusade; it rose to its greatest height during the fourth crusade and the attack upon the Albigenses. The first 40 years of the 13th century was the period during which the courtly lyrical poetry was cultivated with most assiduity. At first it was a purely aristocratic pastime, and among the principal trouvères were princes such as Thibaut IV of Navarre, Louis of Blois and John, king of Jerusalem. About 1230 the taste for court poetry spread to the wealthy bourgeoisie, especially in Picardy, Artois and Flanders. Before its final decline, and after the courts of Paris and Blois had ceased to be its patrons, the poetry of the trouvères found its centre at Arras, where some of the most skilful of all the trouvères, such as Jacques Bretel and Adam de la Halle, exercised their art. About 1280 the poetical system suddenly disappeared.

The poet was invariably a lover, devoted to a married lady who was not his wife, and to whose caprices he was bound to submit blindly and patiently. The progress of this conventional courtship was laid down according to certain strict rules of ceremonial, love became a science and a religion, practised by the laws of precise etiquette. The *rondel* of Adam de la Halle (published in E. de Coussemaker's edition, 1872) beginning

"À Dieu comant amouretes,
Car je m'en vois
Souspirant en tere estrange!"

marks perhaps the highest point to which the delicate, frosty art of the trouvères attained. Music took a prominent place in all their performances, but little is known of the melodies which they used. But enough has been discovered to justify the general statement of Tiersot that "we may conclude that the musical movement of the age of the trouvères was derived directly from the most ancient form of popular French melody." A precious ms. in the Faculty of Medicine of Montpellier contains the music of no fewer than 345 part-songs attributed to trouvères.

BIBLIOGRAPHY.—E. de Coussemaker, *Art harmonique aux XII^me^ et XIII^me^ siècles* (1865); A. Jeanroy, *Les Origines de la poésie lyrique en France au moyen âge* (1889); J. Tiersot, *Histoire de la chanson populaire en France* (1889); H. Rinet, *Le Style de la lyrique courtoise en France aux XII^me^ et XIII^me^ siècles* (1892), G. Paris, *Les Origines de la poésie lyrique en France au moyen âge* (1892). The works of the principal trouvères have been edited; those of Le Châtelain de Coucy by F. Michel (1830) and by Fritz Fath (1883), of Thibaut IV, King of Navarre, by P. Tarbé (1851) and by A. Wallenskold (1925), of Adam de la Halle by E. de Coussemaker (1872); of Conon de Béthune by Wallenskold (Helsingfors, 1891).

TROUVILLE, a seaside town of northwestern France, in the department of Calvados, on the English channel, 34 mi. N.E of Caen by rail. Pop. (1946) 7,052. Trouville stands at the mouth of the Touques on its right bank opposite Deauville. Its fine stretches of sand and excellent bathing make it the most frequented French resort on the channel. Deauville is well known for its racecourse and villas. The port, shared with Deauville and formed by the Touques, is entered by a channel between jetties with a depth at high tide of 17½ ft.; it is supplied with a half-tide dock, filled to scour the channel, and a floating dock, with average depth of 18 ft.

Timber, coals and cement are imported. The London and South Western railway company has a daily steamboat service from LeHavre to Trouville in connection with its Southampton and LeHavre boats.

TROWBRIDGE (tro'brij), a market town, Westbury parliamentary division, Wilts., England, 974 mi W. by S of London by the G. W. railway. Pop of urban district (1938 est.) 12,470.

Trowbridge was mentioned in Domesday under the name of Strabung, a manor held by one Brictric together with Staverton and Trowle, now both included within its limits. The first reference to the "town" of Trowbridge occurs early in the 16th century; previous to that date mention is made of the manor and castle only. Trowbridge is now a non-corporate town and is the chief centre of the West of England woollen industry and makes kerseymere, broadcloth and other woollen goods. Area, 3.5 sq mi.

TROY, JOHN WEIR (1868–1942), U.S. politician, was born in Dungeness, Wash., on Oct. 31, 1868. He began work in the newspaper field, starting as a reporter in his 18th year, and rotated his experience in journalism with work as county clerk and auditor. During the Klondike gold rush, Troy landed a job as manager of a pack train and stayed on in Alaska as editor of an Alaskan newspaper. Later he founded a magazine but it was short-lived, in 1913 he became editor of the *Daily Alaska Empire* in Juneau. In the following year he purchased the newspaper. Six times Alaskan delegate to the National Democratic convention, he was chairman of the Democratic Alaska Territorial committee, 1932–34.

Troy became governor of Alaska in 1933, serving until 1939. He died in Juneau on May 2, 1942.

TROY, a city of southeastern Alabama, U.S.A., county seat of Pike county; on federal highway 231, and served by the Atlantic Coast and the Central of Georgia railways. Pop. (1950) 8,474; (1940) 7,055; and (1920) 5,696 (50% Negroes). It is the seat of a state teachers college (1887); the trade centre of a rich agricultural region, producing especially cotton, cattle, hogs and peanuts; and has several manufacturing industries. The city was incorporated in 1843.

TROY, a city of eastern New York, U.S., the county seat of Rensselaer county, on the east bank of the Hudson river, 7 mi. above Albany, at the mouth of the Mohawk. It is on federal highway 4 and the State Barge canal, and is served by the Boston and Maine, the Delaware and Hudson, the New York Central and motorbus and truck lines and river steamers. Pop. (1950) 71,659; 70,304 in 1940, by federal census. Across the river are Cohoes, Watervliet, Green Island and Waterford, connected with Troy by bridges, and Schenectady is only 15 mi. northwest. The city has a water front of 7 mi. and an area of 9.32 sq.mi., rising from the river to hills on the east 400 ft. high. Its 10 parks cover 300 acres. The Catskill mountains are visible on the southwestern horizon. Troy is at the head of steamboat navigation on the Hudson. Two rapid streams, Poesten kill and Wynants kill, flowing into the Hudson from the east through deep ravines, furnish water power, and hydroelectric current also is available. Troy has long been an important industrial and commercial city. It is the principal centre in the United States for the manufacture of shirts and collars, and among its other leading products are men's clothing, surveying instruments, abrasives, valves, hydrants, bells, coke, chains, brushes and automobile parts. Among the educational institutions in the city are the Rensselaer Polytechnic institute, founded in 1824 by Stephen van Rensselaer of Albany, and Russell Sage college for women (est. 1916).

The site of Troy was part of the Van Rensselaer manor grant of 1629. In 1659 it was bought from the Indians, with the consent of the patroon, by Jan Barentsen Wemp, and in 1707 it passed into the hands of Derick van der Heyden. In 1777 Gen. Philip Schuyler had his headquarters on Van Schaick's Island, in the Mohawk and Hudson. After the close of the Revolution there was an influx of settlers from New England; a town was laid out on the Van der Heyden farm; in 1789 the name of Troy was adopted in town meeting; in 1793 the county seat was established there; in 1794 the village was incorporated, and in 1816 it was chartered as a city. A newspaper, *The Farmer's Oracle*, began publication in 1797. In 1812 a steamboat line was established between Troy and Albany, and in 1825 the Erie canal was opened. During the War of 1812 Troy filled large contracts for army beef. Puddling works were opened in 1839, and for many years the city was the centre of the iron and steel industry of New York. The second Bessemer steel works in the United States was established there in 1865. During the Civil War Troy supplied much cannon and ammunition, and made the armour plate and part of the machinery for the "Monitor." The last steel and iron works discontinued operations about 1896. The collar industry dates its origin from 1819, when Hannah Lord Montague of Troy had the ingenious idea of making separate collars for her husband's shirts. The idea spread, and in 1829 Ebenezer Brown, a local

merchant, had collars made to sell in his store The manufacture of cuffs was begun in 1845. After the introduction of the sewing machine in 1852 the industry grew rapidly, reaching its peak about the time of World War I. The city had a population of 28,985 in 1850; 39,235 in 1860, 56,747 in 1880, 60,051 in 1900; 76,813 in 1910 In 1820, 1834 and 1862 it suffered from destructive fires

TROY, a city of western Ohio, U S , the county seat of Miami county, on federal highway 25, and the west bank of the Great Miami river, 20 mi N of Dayton It has an airport, and is served by the Baltimore and Ohio and the Big Four railways The population in 1950 was 10,628; it was 9,697 in 1940 and 8,675 in 1930 by federal census. Troy was settled in 1807 and was chartered as a city in 1890.

TROY and **TROAD. The Troad** (ἡ Τρωάς), or land of Troy, is the north-west promontory of Asia Minor, between the valleys of the Caicus on the south and the Aesepus flowing into Propontis on the east. The eastern limit was variously defined by ancient writers Geographically, it is undoubtedly (as Strabo says) the range of Ida, which, from the north shore of the Adramyttian gulf, sends its north-western spurs nearly to the coast of the Propontis. The greatest length of the Troad from north-west at Cape Sigeum (Yeni Shehr), to the south-west at Cape Lectum (Babâ Kale), is about 40 m ; the breadth, not much greater. The central area is drained by the Menderes (anc. *Scamander*), which rises in Ida and reaches the Hellespont east of Cape Sigeum.

Timber is supplied by pine forests on Mt. Ida. But the plains and hills are fairly wooded. Besides valonia oak, there are elm, willow, cypress and tamarisk, with lotus, galingale and reeds, as in Homeric days, about the streams. The vine is cultivated; watermelons are abundant; cotton, wheat and maize are grown. Even under Turkish rule, the natural advantages of the land mitigated the poverty of its inhabitants; in antiquity it was fertile and populous.

Early History.—In Greek legend, Priam of Troy ruled all that is bounded by "Lesbos, Phrygia and the Hellespont" (*Il.* xxiv. 544). The Achaeans under Agamemnon destroyed Troy, and overthrew Priam's dynasty. But there is Homeric prophecy that Aeneas and his descendants shall still rule over the Troes, in a passage probably later than the bulk of the book, and it is certain that in the 7th or 6th century B C. reputed descendants reigned somewhere in the Troad. Thracian tribes, including Bithynians and Treres, swept into Asia Minor from Europe in the 7th century B.C., and the Ionian poet, Callinus, recorded the terror which they caused.

Greek Settlements.—The earliest and most important of the Greek settlements were Aeolic, mainly from Lesbos and Cyme in Aeolis; some may have been as early as the 13th century B C. About 620 B.C. Athenians occupied Sigeum, and were resisted by Aeolic colonists from Mytilene, already established in that neighbourhood.

Chief Greek towns in the Troad were Ilium in the north, Assus (*q v.*) in the south, and Alexandria Troas (*q v.*) in the west. The site of the Greek Ilium is marked by the low mound of Hissarlik (Turk. "place of fortresses") in the Trojan plain, about 3 m from the Hellespont, the traditional site of Homer's "Troy" When Xerxes visited the Trojan plain, he "went up to the Pergamon of Priam," and sacrificed to the Ilian Athena. Ilium yielded to Dercyllidas in 399 B.C , and was captured by Charidemus in 359 B.C , but was evidently still of small importance when, in 334 B.C , Alexander visited it on landing in the Troad. In their temple of Athena the Ilians showed him arms which had served in the Trojan war, including the shield of Achilles. Either then or after the battle of Granicus, Alexander enlarged the town to be a "city," with political independence and exemption from tribute. Lysimachus executed the intentions of Alexander when north-west Asia Minor fell to him in 301 B.C., building a wall 5 m in circumference, incorporating decayed towns of the neighbourhood, and building a temple of Athena. In the 3rd century B C Ilium was the head of a federal league of free Greek towns, from Lampsacus on the Hellespont to Gargara on the Adramyttian gulf. In 278 B.C. the Gauls, under Lutarius, occupied Ilium, but abandoned it. Forty years later (218 B.C.) other Gauls brought by Attalus I for his war against Achaeus, deserted his standard, pillaged the towns on the Hellespont, and besieged Ilium, from which, however, they were driven off by the troops of Alexandria Troas In the 2nd century B C Ilium was in decay; as Demetrius of Scepsis says, the houses "had not even roofs of tiles" The temple of Ilian Athena, however, retained its prestige, in 192 B.C. Antiochus the Great visited it before sailing to the aid of the Aetolians In 190 B C , before the battle of Magnesia, Romans and Ilians were alike eager to recall the legend of Roman descent from Aeneas; Lucius Scipio offered sacrifice to the Ilian Athena; and after the defeat of Antiochus the Romans annexed Rhoeteum and Gergis to Ilium, "not so much in reward of recent services, as in memory of the source from which their nation sprang." The later history of Ilium is a catalogue of Roman benefactions, though, in 85 B C , when Fimbria took it, he left it in ruins, Sulla, however, was careful to rebuild it; Augustus confirmed its ancient privileges and gave it new territory, Caracalla (A D 211–217), like Alexander, paid honours to the tomb of Achilles In the 4th century, the Ilians were attracting tourists by their pseudo-Trojan memorials. After the 4th century the place is lost to view.

Of the other ancient cities, *Neandria* seems to be rightly fixed at Mt. Chigri, not far from Alexandria Troas, remarkable for its fine view of the whole Troad. *Cebrene* has been located in the eastern part of the plain of Bairamich, *Palaescepsis*, farther east, on Ida, while the new *Scepsis* was near Bairamich. At Kulakli, south of the mouth of the Tuzla, Corinthian columns mark the temple of Apollo Smintheus (excavated in 1866 by Pullan) and (approximately) the Homeric *Chryse*. *Colonae* was on the coast opposite Tenedos *Scamandria* was at Eneh, in the plain of Bairamich, and *Cenchreae* probably some way north of it The shrine of Palamedes, *Polymedium*, has been discovered by J T. Clarke between Assus and Cape Lectum; the sacred enclosure and the statue of Palamedes were on the acropolis. Clarke also found very ancient walls on Gargarus, the highest peak of Ida.

The Site of Troy.—The traditional site, at the Hellenistic Ilium, is the mound of Hissarlik, on a spur between the main Scamander valley and its last tributary from the east (anc. *Simois*), about 3½ m. from the Hellespont and from the Aegean shore, north of Besika bay The famous academic dispute concerning the site, which began about A D 160 with Demetrius of Scepsis, may be regarded as settled by the discovery, made in 1893, of a fortress on the mound of Hissarlik, contemporary with the great period of Mycenae, and overlying the smaller and the earlier acropolis first identified by Schliemann in 1872. The rival ruins of a small hill fort on the Bali Dagh which, with another on an opposite crag, commanded the gorge where the Scamander descends into the plain neither accord with Homeric description nor challenge the remains at Hissarlik in importance

No site in the Troad accords completely with all the topographical clues ingeniously derived from the text of Homer. The hot and cold springs that lay just without the gate of "Troy" are no more to be identified with Bunarbashi, which wells out more than a mile from the Bali Dagh ruins, than with the choked conduits south of Hissarlik, opened by Schliemann in 1882 But the broader topography is recognizable in the modern plain of the Menderes. The old bed of that river is the Scamander, and its little tributary, the Dumbrek Su, is the Simois In their fork lies Hissarlik or Troy. In sight of it are, on the one side, the peak of Samothrace (Il xiii. 12–14); on the other Mt Ida (Kaz Dagh viii. 52). Hissarlik lies in the plain (xx. 216), easily reached by foes from the shore, or left and regained in a night by a Trojan visiting the Achaean camp (vii. 382–421).

Archaeological Investigation of Troy.—Schliemann's excavations at Hissarlik in 1872–74, supplemented and confirmed by W. Dörpfeld in 1891–94, established the existence of nine superposed settlements, as follows:—

1. On the virgin soil of the natural hillock a small village of the late Aegean Neolithic period, at the dawn of the Bronze age, contemporary with the upper part of the Cnossian Neolithic bed, includes what were supposed by Schliemann to be two primitive settlements. Thin walls of rough stones, bonded with

mud, reveal no house-plans, nor traces of fortress wall Implements in obsidian and various kinds of stone, clay whorls, a little worked ivory, accompany dark monochrome pottery, hand-polished, with simple geometric decoration, incised and often filled with white.

2. Superposed and comprehending a larger area, lies the "second city," better constructed and preserved, and twice rebuilt Its massive fortress wall of rudely squared "Cyclopean" masonry suffered several restorations and eventual destruction, except on the south Double gates at south-east and south-west are well-preserved. The most complete and most important structures within are a *megaron* and vestibule of the type familiar in "Mycenaean" palaces, with one or more smaller replicas alongside it, like the "women's quarters" at Tiryns (*q v*) and Phylakopi (*See* AEGEAN CIVILIZATION) This is the fortress proclaimed by Schliemann in 1873 to be the "Pergamos" of Troy, mainly because it perished by fire But this second stratum belongs to a primitive stage of local civilization preceding the "Mycenaean," which is the earliest recalled by the Homeric poems. The pottery now shows the first rare use of paint, and of technique and fantastic forms parallel to those of the pre-Mycenaean Cyclades. Trough-spouted vases are characteristic, and rude reproductions of human features are common in this ware, which seems all native. Bronze had come into use for implements, weapons and vessels; a hoarded treasure found in the ruins of the fortification wall includes much gold and silver But the forms are primitive and the workmanship very rude Personal ornaments are cut out of thin plate gold or built of coiled wire. But some of the discs, bracelets and pendants, with advanced spiral ornament, found in 1878 and ascribed to this stratum, belong undoubtedly to the sixth or "Mycenaean." Rough fiddle-shaped idols, whorls, a little worked ivory and some lead make up a find, of whose early period (probably about 2000 B.C) comparison of objects found elsewhere leaves no doubt. This treasure is now deposited in Berlin with the bulk of Schliemann's collection

3, 4, 5. After the burning of the "second city," Hissarlik ceased for a time to have any considerable population Three small village settlements have left their traces superposed and show only slight advances of material culture.

6 The mound, however, occupied too important a site, in relation to the plain and the sea, to remain desolate, and it was occupied in the 14th or 13th century by a great fortress, while a city not yet explored, spread below. This "sixth city" was first distinguished clearly by Dörpfeld in 1882, but Schliemann's drastic methods confused its commoner pottery and metal objects with those of lower strata; and some grey ware, to which Schliemann gave the name "Lydian" was alone referred to this sixth or "Lydian" city, in his *Troja* (1884). This ware has been compared with the "Minyan" fabric at Orchomenus, but also resembles the "Lausitz" pottery, which originated on the middle Danube, and was intruded into Macedonia at the close of the 12th century For years this "sixth city" was neglected.

In 1893, however, excavations in hitherto undisturbed ground outside the earlier fortress, exposed a wall of massive ashlar masonry resembling the fortifications of Mycenae itself, and "Mycenaean" walls at Phylakopi in Melos. With this wall occurred not only the grey ware, but painted potsherds unmistakably "Mycenaean"; and further search showed that such sherds were characteristic of "sixth city" deposits. The inevitable inference is that this city imported contemporary "Mycenaean" ware to supplement its own ruder products. The area of its citadel is larger than the "second city," its buildings, which include a large *megaron*, are of finer construction. This was the most important city yet built on the mound It belonged to the "Mycenaean" age, which precedes the composition of the Homeric poems, and is reflected by them. Therefore this is Homer's Troy.

Its remains, however, having been obliterated on the crown of Hissarlik, almost escaped recognition, for when, long afterwards, the Hellenistic Ilium was built, the top of the mound was cut away and the uppermost strata vanished. Thus we find them now on the southern slope of the mound only, but have no difficulty in estimating their original extent. Tombs and the outer quarters of this city will doubtless be found eventually.

7. The "sixth," or "Mycenaean" Troy, perished by violence like the "second city," but its inhabitants reoccupied its ruins, until, in early Hellenic times, the small unfortified settlement was established which maintained itself till the Homeric enthusiasm of Alexander the Great called a city again into being on Hissarlik

8. The Hellenistic Ilium, however, has left comparatively little trace; fortifications erected by Lysimachus are visible on the acropolis and in the plain A small Doric temple belongs to this city, and a larger one, probably dedicated to Athena, seems to be of Pergamene age. Fragments remain of its metopes, representing Helios and a Gigantomachia. Coins of this city show Athena on both faces, and inscriptions prove that Hellenistic Ilium was of some importance.

9 Lastly, about the Christian era, the Graeco-Roman city built a theatre and an ornate gateway on the south-east slope, a large building on the south-west and others to north-east. This city seems to have decayed in the 5th century A.D

The Legend of Troy.—In Greek legend, the oldest town in the Troad was that founded by Teucer, who was a son of the Scamander (a Cretan stream, according to Tzetzes) and the nymph Idaea. In his reign, Dardanus, son of Zeus and the nymph Electra, daughter of Atlas, in consequence of a deluge, drifted from Samothrace to the Troad, where he received land from Teucer, married his daughter Batea, and founded Dardana, at the foot of Mt. Ida. On the death of Teucer, Dardanus succeeded him, and called the whole land Dardania He begat Erichthonius, who begat Tros by Astyoche, daughter of Simois Tros called the country Troy and the people Troes (Trojans) By Callirrhoe, daughter of Scamander, Tros had three sons—Ilus, Assaracus and Ganymede. From Ilus and Assaracus sprang two separate lines; Ilus, Laomedon, Priam, Hector, and Assaracus, Capys, Anchises, Aeneas Ilus went to Phrygia, where he received, as a wrestling prize from the king of Phrygia, a spotted cow, with an injunction to found a city where she lay down. The cow lay down on the hill of the Phrygian Atē; here Ilus founded Ilion; and Dardania, Troy and Ilion became one city. Desiring a sign from Zeus, Ilus prayed and found lying before his tent the Palladium, a wooden statue of Pallas, for which he built a temple. By Eurydice, daughter of Adrastus, he had a son, Laomedon, who married Strymo, daughter of Scamander (or Placia, daughter of Atreus or of Leucippus) In his reign, Poseidon and Apollo (or Poseidon alone), built the walls of Troy, but Laomedon withheld their reward. In his reign also, Heracles besieged and took the city, slaying Laomedon and his children, except one daughter, Hesione, and one son, Podarces. The life of Podarces was granted at the request of Hesione, on condition that Podarces first be a slave and then be redeemed by Hesione; she gave her veil for him; hence his name of Priam (Gr πριάσθαι, to buy). Priam married first Arisbe and afterwards Hecuba, and had 50 sons and 12 daughters. Among the sons were Hector and Paris, and among the daughters Polyxena and Cassandra. Paris, betrothed to Oenone, awarded the golden "apple of strife" to Aphrodite (who promised him the love of the fairest of women) and brought upon Troy the resentment of Hera and Athena Thereafter, Paris, visiting Sparta, found favour with Helen, heiress of

Tyndareus and wife of Menelaus, son of Atreus, and carried her to Troy. To recover Helen, the Achaeans under Agamemnon, brother of Menelaus, besieged Troy for ten years. In the tenth year Hector was killed by Achilles, and he by Paris. At last a wooden horse was contrived in whose hollow many Achaean heroes hid themselves Their army and fleet then withdrew to Tenedos, feigning to have raised the siege The Trojans conveyed the wooden horse into Troy; in the night the Greeks stole out, opened the gates to their friends, and Troy was taken *See also* HOMERIC POEMS.

The Historical Background of the Trojan War.—The "Tale of Troy," with legends of heroes who "fought in the war," was popular when the *Odyssey* (*see* HOMER) was composed; wherein minstrels sing lays about it, and the Sirens boast that they "know it all." From the 7th century B.C., at least, it supplied subjects to vase painters and other craftsmen, and in the 5th, to the sculptors of the Aegina pediments (*see* GREEK ART), and to Athenian dramatists. (*See* DRAMA: *Greek*.) Herodotus and Thucydides, like ancient writers generally, accepted the Trojan war as historical, though they criticized epic statements in detail, and Herodotus noted discrepancy between the *Cypria* and the *Iliad* Ephorus, and afterwards Strabo, marshalled geographical learning as commentary on the Achaean and Trojan "catalogues" in *Il* ii; the scholars of Alexandria elucidated Homeric antiquities, those of Pergamum their topographical and historical background; Demetrius of Scepsis in the Troad, misdoubted, on geological grounds, the reputed site of Troy Traditional genealogies, collated by Hecataeus (*see* HECATAEUS OF MILETUS) and others, enabled Eratosthenes (*q.v.*) to date the "Fall of Troy" to 1194 B.C., in the third generation before the "coming of the Dorians" and in the second after Laomedon's foundation. Homeric references to Egypt (where Thebes, not Memphis, is the capital) and to Phoenicia (where Sidon is known, but not Tyre) supply a historical background for the war, not later than the 12th century; but the names of Egyptian kings (*Thôs, Thuôris*) in epic and classical tradition, are not identified: Pliny (36.64) alludes to a Rameses "in whose time Troy fell." Egyptian references, however, to repeated sea-raids into the Levant, between 1230 and 1190 B.C., depict a situation closely resembling Homeric descriptions; and the *Aquiusha* (*Akhaywasha*), *Danauna*, *Tukkara* (*Teukaroi*) and probably other participants in these raids may be safely recognized as Achaeans, Danaans, and Teucrians in Greek tradition. Hittite documents confirm the existence of an oversea régime called Akkhayawa, aggressive against south-west Asia Minor, one of whose leaders, Attarissyas, active in Caria and north Syria about 1230, was a contemporary, if not namesake, of Atreus, father of Agamemnon Consequently, 13th century doubts as to the historical content of epic tradition, and attempts to discover "solar" and other mythological allegories in the personages and events of the war, are being superseded by recognition of a social and political régime historically assignable to the 13–12th centuries, of which the following are turning-points: (1) The establishment of the Trojans, with other Thraco-Phrygian peoples, in north-west Asia Minor before 1260 B.C fully justifying the defensive alliance between the Hittite king and Rameses II. in 1271 B.C. (2) The consolidation of a dominion, of which the "sixth city" at Hissarlik was an important centre; the geographical range of Priam's vassals, from the Axius river to the Xanthus, and the memory of a great fight "on the Sangarius river" far inland, are instructive (3) The overthrow of Hittite dominion by this new régime, about 1200 B.C., followed by the land-and-sea-raids of 1197–94 as far as south Palestine, where they were stopped by Rameses III. (4) The counterparts, west of the Aegean, of the dynasty Laomedon-Priam-Hector, are the "divine born" kingships (Pelops-Atreus-Agamemnon, Aeacus-Peleus-Achilles, and the like) established by adventurers of unknown antecedents, and foreign names. from Ithaca and Aetolia to Crete and Rhodes, and as far north as Thessaly, their distribution closely covering that of the "Late Mycenaean" settlements, which are surely dated archaeologically to these generations, in Egypt, Cyprus and Palestine (5) Whether the destruction of the "sixth city" resulted from an attack of this "Achaean" confederacy of the south-west Aegean on the Hellespontine citadel of its Thraco-Phrygian cousins, or directly from those Danubian representatives of the "Lausitz" culture which characterizes the "seventh city," and is recognizable as a disturbing factor in Macedonia also, later in the 12th century, cannot at present be determined, nor the value of the synchronism between the attack on Troy and the great sea-and-land-raids towards Egypt, of which the tale of Tithonus and Memnon may preserve echoes. (6) Traditions of the establishment of settlements, eventually Greek, round the margins of the Late Mycenaean world, are so numerous, and coherent both with Homeric and with archaeological evidence, that they may be accepted as an essentially historical counterpart of the situation described in the *Odyssey;* which, however, was transformed as profoundly by the "coming of the Dorians" as the Mycenaean world had been by the irruption of the "divine born" adventurers five generations before. Between those two crises lies the "Heroic Age" of the Aegean, of its central episodes one is the struggle between Argos and Thebes, ended by the tragic fall of the Cadmeian dynasty, the other is the Trojan war, as disastrous to the victors as to the conquered (J. L. MY.)

The Mediaeval Legend of Troy.—The mediaeval *Roman de Troie*, exercised greater influence in its day and for centuries after its appearance than any other work of the same class Just as the *chansons de geste* of the 10th century were the direct ancestors of the prose romances which afterwards spread throughout Europe, so, even before Heliodorus and Achilles Tatius, there were quasi-histories, which reproduced in prose, with more or less exactness, the narratives of epic poetry. The *Heroikos* of Flavius Philostratus (*fl.* 3rd century A.D.) is a discourse on 26 heroes of the war. A fictitious journal (*Ephemeris*), professing to give the chief incidents of the siege, and said to have been written by Dictys of Crete, a follower of Idomeneus, is mentioned by Suidas, and was largely used by John Malalas and other Byzantine chroniclers This was abridged in Latin prose, probably in the 4th century, under the title of *Dictys Cretensis de bello Trojano libri VI.* It is prefaced by an introductory letter from a certain L. Septimius to Q. Aradius Rufinus, in which it is stated that the diary of Dictys had been found in his tomb at Knossos in Crete, written in the Greek language, but in Phoenician characters The narrative begins with the rape of Helen, and includes the adventures of the Greek princes on the return voyage With Dictys is always associated Dares, a pseudo-historian of more recent date. Old Greek writers mention an account of the destruction of the city earlier than the Homeric poems, and in the time of Aelian (2nd century A.D.) this *Iliad* of Dares, priest of Hephaestus at Troy, was believed to be still in existence. Nothing has since been heard of it; but an unknown Latin writer, living between 400 and 600, took advantage of the tradition to compile *Daretis Phrygii de excidio Trojae historia*, which begins with the voyage of the Argo It is in prose and professes to be translated from an old Greek manuscript. Of the two works that of Dares is the later, and is inferior to Dictys The matter-of-fact form of narration recalls the poem of Quintus Smyrnaeus. In both compilations the gods and everything supernatural are suppressed, even the heroes are degraded. The permanent success, however, of the two works distinguishes them among apocryphal writings, and through them the Troy legend was diffused throughout western Europe. The Byzantine writers, from the 7th to the 12th century, exalted Dictys as a first-class authority, with whom Homer was only to be contrasted as an inventor of fables. Western people preferred Dares, because his history was shorter, and because, favouring the Trojans, he flattered the vanity of those who believed that people to have been their ancestors Many mss. of both writers were contained in old libraries; and they were translated into nearly every language and turned into verse.

In the case of both works, scholars were long undecided whether a Greek original ever existed but fragments of the Greek text of Dictys have been recovered. (*See* Dictys Cretensis) The Byzantine grammarian, Joannes Tzetzes (*fl.* 12th century), wrote a Greek hexameter poem *Iliaca* on the subject. In 1272, a monk of Corbie translated "sans rime *L'Estoire de Troiens et de Troie* (de Dares) du Latin en Roumans mot à mot" because the *Roman de Troie* was too long. Geoffrey of Waterford put Dares into French prose; and the British Museum has three Welsh mss. translations of the same author, of a much later period

For a thousand years the myth of descent from the dispersed heroes of the conquered Trojan race was a sacred literary tradition throughout western Europe. The first Franco-Latin chroniclers traced their history to the same origin as that of Rome, as told by the Latin poets of the Augustan era; and in the middle of the 7th century Fredegarius Scholasticus (*Rer. gall. script.* ii. 461) relates how one party of the Trojans settled between the Rhine, the Danube and the sea. In a charter of Dagobert occurs the statement, "ex nobilissimo et antiquo Trojanorum reliquarum sanguine nati." This statement is repeated by chroniclers and panegyrical writers, who also considered the *History of Troy* by Dares to be the first of national books. Succeeding kings imitated their predecessors in giving official sanction to their legendary origin; Charles the Bald, in a charter, uses almost the same words as Dagobert, "ex praeclaro et antiquo trojanorum sanguine nati." In England a similar tradition had been early formulated, as appears from Nennius's *Historia Britonum* and Geoffrey of Monmouth. The epic founder of Britain was Brutus, son, or in another tradition, great-grandson, of Aeneas, in any case of the royal house of Troy. The tradition, repeated in Wace's version of Geoffrey, by Matthew Paris and others, persisted to the time of Shakespeare. Brutus found Albion uninhabited except by a few giants. He founded his capital on the banks of the Thames, and called it New Troy. Otto Frisingensis (12th century) and other German chroniclers repeat similar myths. About 1050 a monk named Bernard wrote *De excidio Trojae*, and in the middle of the 12th century Simon Chèvre d'Or, canon of the abbey of Saint-Victor, Paris, followed with another poem in leonine elegiacs on the fall of the city and the adventures of Aeneas, in which the Homeric and Virgilian records were blended

About the year 1184 Benoît de Sainte-More (*q.v.*) composed a poem of 30,000 lines entitled *Roman de Troie*. He derived his information chiefly from the pseudo-annals of Dictys and Dares, but we may justly consider the *Roman de Troie* as an original work. From this source subsequent writers drew their notions of Troy, mostly without naming their authority and generally without even knowing his name. This is the masterpiece of the pseudo-classical cycle of romances: and in the Latin version of Guido delle Colonne it passed through every country of Europe.

The *De bello trojano* of Joseph of Exeter, in six books, a genuine poem of no little merit, was written soon after Benoît's work or about the years 1187–88. At first ascribed to Dares Phrygius and Cornelius Nepos, it was not published as Joseph's until 1620, at Frankfurt It was directly drawn from the pseudo-annalists, but the influence of Benoît was considerable Of the same kind was the *Troilus* of Albert of Stade (1249), a version of Dares, in verse, characterized by the old severity and affected realism. But these Latin works can only be associated indirectly with Benoît, who had closer imitators in Germany at an early period. Herbort of Fritzlar reproduced the French text in his *Lied von Troye* (early 13th century), as did also Konrad von Würzburg (d 1287) in his *Buch von Troye* of 40,000 verses, which he himself compared to the "boundless ocean." It was completed by an anonymous poet. To the like source may be traced a poem of 30,000 verses on the same subject by Wolfram von Eschenbach; and Jacques van Maerlant reproduced Benoît's narrative in Flemish The Norse or Icelandic *Trojumanna saga* repeats the tale with some variations.

In Italy, Guido delle Colonne, a Sicilian, began in 1270 and finished in 1287 a prose *Historia trojana*, in which he reproduced the *Roman de Troie* of Benoît, and so closely as to copy the errors of the latter. The vivacity and poetry of the Anglo-Norman trouvère disappear in a dry version. The immense popularity of Guido's work is shown by the large number of existing manuscripts. In the 14th and the commencement of the 15th century four versions appeared in England and Scotland. The best known is the *Troy Book*, written between 1414 and 1420, of John Lydgate, who had both French and Latin texts before him An earlier and anonymous rendering exists at Oxford (Bodleian ms Laud Misc. 595). There is the *Gest Hystoriale of the Destruction of Troy* (Early Eng. Text Soc, 1869–1874), written in a northern dialect about 1390; a Scottish version (15th century) by a certain Barbour, not the poet, John Barbour; and *The Seege of Troy*, a version of Dares (Harl. ms. 525 Brit. Mus) The invention of printing gave fresh impetus to the spread of Guido's work. The first book printed in English was *The Recuyell of the Hystoryes of Troye*, a translation by Caxton from the French of Raoul Lefèvre

Bibliography.—The Troy legend is dealt with in the elaborate work of A Joly, *Benoît de Sainte-More et le Roman de Troie* (1870–71); G Körting, *Der altfrzs. Roman de Troie* (1883), F. Settegast, *Benoît de Ste-More* (Breslau, 1870); G. C. Frommann, *Herbort v. Fritzlar u Benoît de Ste-More* (Stuttgart, 1837), R. Jackel, *Dares Phrygius u. Benoît de Ste-More* (Breslau, 1875); *Le Roman de Troie*, ed L. Constans (Soc. d anc. textes fr. Paris, 1904).

TROYES, a town of France, capital of the department of Aube, 104 mi. E.S E. of Paris on the Eastern railway to Belfort. Pop. (1936) 57,961 The town stands in the wide alluvial plain watered by the Seine, the main stream of which skirts it on the east. It is traversed by several small arms of the river, and the Canal de la Haute-Seine divides it into an upper town, on the left bank, and a lower town, on the right bank The churches of the town are numerous, and especially rich in stained glass of the Renaissance period. St. Pierre, the cathedral, 13th to 16th centuries, consists of an apse with seven apse chapels, a choir with double aisles, on the right of which are the treasury and sacristy, a transept without aisles, a nave with double aisles and side chapels and a vestibule. There are stained glass windows of the 15th and 16th centuries The treasury contains some fine enamel work and lace. The church of St. Urban has windows dating for the most part from the years 1265–80. Most of the old houses of Troyes are of wood, but some are of stone of the 16th century, notably the hôtels de Vauluisant, de Mauroy and de Marisy. The prefecture occupies the buildings of the old abbey of Notre-Dame-aux-Nonnains; the *hôtel de ville* dates from the 17th century.

Troyes is the seat of a bishop and a court of assize. Its public institutions include a tribunal of first instance, a tribunal of commerce, a board of trade arbitrators and a chamber of commerce It has a school of hosiery. The dominant industries in Troyes are the manufacture of cotton, woollen and silk hosiery, printing and dyeing of fabrics.

History.—At the beginning of the Roman period Troyes was the principal settlement of the Trecassi, from whom it derives its name. In the first half of the 4th century its bishopric was created as a suffragan of Sens. St. Loup, the most illustrious bishop of Troyes, occupied the episcopal seat from 426 to 479. In the early middle ages the bishops were supreme in Troyes, but in the 10th century this supremacy was transferred to the counts of Troyes (*see* below), who from the 11th century were known as the counts of Champagne. Under their rule the city attained great prosperity. Its fairs, which had already made it a prominent commercial centre, flourished under their patronage, while the canals constructed at their expense aided its industrial development. The union of Champagne with the domains of the king of France in 1304 was disastrous to the city, since one of the first measures of Louis le Hutin was to forbid the Flemish merchants to attend its fairs. For a short time (1419–25), during the Hundred Years' War, the town was the seat of the royal Government, and in 1420 the signing of the Treaty of Troyes was followed by the marriage of Henry V of England with Catherine, daughter of Charles VI. in the church of St. Jean. In 1429 the town capitulated to Joan of Arc. The next 100 years was a period of prosperity, marred by the destruction of half the town by the fire of 1524 In the 16th

century Protestantism made some progress in Troyes, but in 1562, after a short occupation, the Calvinist troops were forced to retire, and in 1572 fifty Protestants were put to death The revocation of the Edict of Nantes in 1685 was a severe blow to the commerce of Troyes, which was not revived by the re-establishment of the former fairs in 1697 The population fell from 40,000 to 24,000 between the beginning of the 16th century and that of the 19th century.

See T. Boutiot, *Histoire de Troyes et de la Champagne méridionale* (4 vols. Troyes, 1870–80); R. Koechlin and J. J Marquet de Vasselot, *La Sculpture à Troyes et dans la Champagne méridionale au seizième siècle* (1900).

TROYON, CONSTANT (1810–1865), French painter, was born on Aug 28, 1810, at Sèvres, near Paris, where his father was connected with the porcelain factory. Troyon was an animal painter of the first rank, and was closely associated with the artists who painted around Barbizon Until he was twenty he laboured assiduously at the minute details of porcelain ornamentation By the time he reached twenty-one he was travelling the country as an artist, and painting landscapes. Troyon was a favourite with Roqueplan, and became one of his pupils Roqueplan introduced Troyon to Rousseau, Jules Dupré, and the other Barbizon painters In 1846 Troyon went to the Hague, and saw Paul Potter's famous "Young Bull" From the studies he made of this picture, of Cuyp's sunny landscapes, and Rembrandt's masterpieces he evolved a new method of painting, and it is only in works produced after this time that Troyon's true individuality is revealed Troyon died at Paris on Feb. 21, 1865. All his famous pictures are of date between 1850 and 1864. In the Wallace Gallery in London are "Watering Cattle" and "Cattle in Stormy Weather"; in the Glasgow Corporation Gallery is a "Landscape with Cattle"; the Louvre contains his famous "Oxen Going to Their Work" and "Returning to the Farm"; while the Metropolitan Museum of Art and other galleries in America, contain fine examples His "Vallée de la Toucque, Normandy," is one of his greatest pictures. Émile van Marcke (1827–1891) was his best-known pupil.

See H. Dumesnil, *Constant Troyon: Souvenirs intimes* (Paris, 1888), A Hustin, "Troyon" (1893), D C. Thomson, *The Barbizon School of Painters* (London, 1890), W Gensel, *Corot und Troyon* (Leipzig, 1906).

TRÜBNER, WILHELM (1851–1917), German painter, was born at Heidelberg on Feb. 3, 1851. He studied at Karlsruhe, Stuttgart and afterwards with Diez at Munich, where he came under the influence of Leibl and the impressionist group He did not, however, join this or any other group, but went his own independent way, although he too aimed at achieving the effect of light and air in his painting, and worked with broad strokes of the brush For some years he made Munich his home In 1896 he settled in Frankfurt and in 1903 was made professor at the Karlsruhe academy. He died at Karlsruhe on Dec. 21, 1917 Trübner's colour was always warm and rich; but from the Frankfurt period onward he adopted a more restricted scheme and relied on strong contrasts in place of the tender intermediate tones of his earlier days. He had an admirable sense of values and his landscapes are sometimes built up almost in the manner of Cézanne His portraits were also particularly successful.

His landscapes include the series of Heidelberg landscapes (1889) with the "View from the Castle" (Darmstadt); those painted at Chiemsee, and the later series at Amorbach and the Neuburg (1913) Among his portraits are those of the artist Schuch (Berlin), of his son in armour, and of the "Boy with Mastiff" (Dusseldorf)

See Fritz Knapp, *Kunstlerische Kultur des Abendlandes* III, pp. 330 *et seq.*

TRUCE OF GOD, an attempt of the Church in the middle ages to alleviate the evils of private warfare The two measures which were adopted by the Church to remedy this evil—the *pax ecclesiae* or *Dei* and the *treuga* or *treva Dei*—are usually both referred to as the Truce of God, but they are distinct in character. The latter was a development of the former.

The *pax ecclesiae* is first heard of in the year 990 at three synods held in different parts of southern and central France—at Charroux, Narbonne and Puy. It enlisted the immediate support of the regular clergy, particularly the vigorous congregation of Cluny, and of William V. of Aquitaine, the most powerful lord of southern France, who urged its adoption at the councils of Limoges (994) and Poitiers (999) The peace decrees of these various synods differed considerably in detail, but in general they forbade, under pain of excommunication, every act of private warfare or violence against ecclesiastical buildings and their environs, and against certain persons, such as clerics, pilgrims, merchants, women and peasants, and against cattle and agricultural implements With the opening of the 11th century, the *pax ecclesiae* spread over northern France and Burgundy, and diocesan leagues began to be organized for its maintenance. The bishop, or count, on whose lands the peace was violated was vested with judicial power, and was directed, in case he was himself unable to execute sentence, to summon to his assistance the laymen and even the clerics of the diocese, all of whom were required to take a solemn oath to observe and enforce the peace At the council of Bourges (1038), the archbishop decreed that every Christian 15 years and over should take such an oath and enter the diocesan militia. The idea that peace is a divine institution seems to have given rise to a new name for the peace, the *pax Dei*, or peace of God

The *treuga* or *treva Dei*, the prohibition of every act of private warfare during certain days, goes back at least to the Synod of Elne (1027) which suspended all warfare from Saturday night till prime on Monday. Like the *pax ecclesiae* it found ardent champions in the regular clergy, especially in Odilo (962–1049), the fifth abbot of Cluny, and soon spread over all France It penetrated Piedmont and Lombardy in 1041 and Normandy in 1042 By this time the truce extended from the Wednesday evening to the Monday morning in every week and also, in most places, lasted during the seasons of Lent and Advent, the three great vigils and feasts of the Blessed Virgin, and those of the 12 apostles and a few other saints. The *treuga Dei* was decreed for Flanders at the Synod of Thérouanne (1063) and was instituted in southern Italy in 1089, probably through Norman influence The bishop of Liége introduced it in Germany in 1082, and three years later a synod held at Mainz in the presence of the emperor Henry IV. extended it to the whole empire. It did not extend to England, where the strength of the monarchy made it unnecessary. The popes took its direction into their own hands towards the end of the 11th century; and the first decree of the Council of Clermont (1095), at which Urban II. preached the first crusade, proclaimed a weekly truce for all Christendom, adding a guarantee of safety to all who might take refuge at a wayside cross or at the plough The Truce of God was reaffirmed by many councils, such as that held at Reims by Calixtus II. in 1119, and the Lateran councils of 1123, 1139 and 1179 When the *treuga Dei* reached its most extended form, scarcely one-fourth of the year remained for fighting, and even then the older canons relating to the *pax ecclesiae* remained in force. The means employed for its enforcement remained practically the same: spiritual penalties, such as excommunication, special ecclesiastical tribunals, sworn leagues of peace, and assistance from the temporal power The Council of Clermont prescribed that the oath of adherence to the truce be taken every three years by all men above the age of 12, whether noble, burgess, villein or serf The results of these peace efforts were perhaps surprisingly mediocre, but it must be borne in mind that not only was the military organization of the dioceses always very imperfect, but Continental feudalism, so long as it retained political power, was inherently hostile to the principle and practice of private peace. The Truce of God was most powerful in the 12th century, but with the 13th its influence waned as the kings gradually gained control over the nobles and substituted the king's peace for that of the Church.

TRUCK SYSTEM. The payment of the wages of workmen *in kind*, or in any other way than the unconditional payment of money, a practice known as the "truck system" Sometimes the workman was paid with "portion of that which he has helped to produce," but the more usual form was to give the workman the whole or part of his wages in the shape of commodities suited to his needs. There was also a practice of paying in money, but with an express or tacit understanding that the workman should resort for such goods as he required to shops or stores kept by his employer. The truck system led in many cases to grave abuses and was made illegal in Great Britain by the Truck Acts, under which wages must be paid in current coin of the realm, without any stipulations as to the manner in which the same shall be expended (*See* LABOUR LAW.)

TRUFFLE, the name of several kinds of subterranean fungi of the family Ascomycetes (*See* FUNGI.) Truffles have been famous for their esculent qualities from classical times Several were recognized by the ancient Greeks and Romans, Theophrastus (*c* 300 B.C.) gives one of them a name which apparently refers to a common belief that truffles were produced by thunder Pliny thought that they were amongst the most wonderful of all things in springing up and living without a root There are numerous references to truffles in classical writings and Coelius Apicius gives six recipes for cooking them

The subterranean Ascomycetes are usually placed in two main groups, the Tuberales and the Plectascales, depending upon the possession of fruit-bodies with or without an opening to the exterior during development The suggestion is that these have arisen along parallel lines. A point of interest is that we also have subterranean forms of similar external appearance in Phycomycetes and Basidiomycetes.

The best-known genus of the Tuberales is *Tuber*, which is mainly native to temperate regions. The different species range in size from that of a pea to that of an orange A section of a young specimen shows a whitish homogeneous flesh which, as maturity is approached, becomes a rich dark colour showing a lighter "marbling." Microscopical examination reveals that the trama plates bearing the hymenium are thrown into elaborate folds (*venae internae*) whereas other plates of tissue which are light-coloured, sterile and joined either directly or indirectly to the exterior run between them (*venae externae*). This complicated arrangement is reached by a series of advances which may be traced in the allied genera The spores of *Tuber* are large and are usually not more than four in an ascus; in the same fruit-body a range from one to four may usually be seen These were the first ascospores to be observed; Tournefort described them in 1710–11 and Micheli figured them in 1729. It was a common belief that they became truffles merely by enlargement, though fermentation of the earth, exudations of branches and leaves, excretion of roots, gall production by insects were frequently regarded as reasonable explanations of their formation Truffles principally occur in open woodland on calcareous soil, being rare in or absent from sandy soil and pastures They are usually associated with the roots of trees and are possibly mycorrhizal fungi

The most valued truffle in French cookery is the Périgord truffle (*T. melanosporum*) which is said to have first gained favour towards the end of the 15th century It is brownish black, roundish and covered with polygonal warts having a depression at their summit; the flesh (*gleba*) is first white, then brownish grey, and when mature becomes violaceous black, with white veins having a brown margin. The odour is well-marked and not unpleasant. The main French truffières are in Périgord and the Department of Vaucluse, though truffles are gathered throughout a large part of France The truffle industry is an important one and about one-third of the gatherings are now exported; foreign trade began seriously about a century ago and before the World War reached to as much as £3,000,000 annually As the truffles often occur at the depth of a foot it is difficult to detect them unaided Truffles, when occurring near the surface of the ground, crack it as they reach full size and experienced gatherers are thereby enabled to locate them. Further, many species of fly live on truffles and in the morning and evening columns of small yellow flies (*Helomisa lineata*, etc.) may be seen hovering over the place where truffles are present.

Occasionally man is sufficiently "susceptible" to the scent of truffles to be able to locate them. Several kinds of animals, however, recognize the scent without difficulty. Truffle hunting is therefore carried on with their aid; pigs and dogs being generally used, though goats are said to be so trained in Sardinia.

The truffle industry has proved so profitable in France that the government has taken in hand the reforesting of many large and barren areas, for many of the best truffle regions have become productive by the private planting of the appropriate trees These are oaks (*Quercus cocifera*, *Q. ilex* with admixture of *Q robur*, *Q sessiliflora* and hazel); "si voulez des truffes, semez des glands" is an adage which has been handed on for generations Direct attempts at cultivation have so far proved unsatisfactory. Calcareous ground is dug over and acorns or seedlings planted. Soil from truffle areas is usually spread about and the ground is kept in condition by light ploughing and harrowing After three years clearings are made and the trees are pruned Truffles if they are to appear do so only after five years or so; gathering begins then but it hardly pays until after from eight to ten years. The yield is at its maximum from five to twenty-five years later. *Tuber melanosporum* has not been recorded for England

The English truffle is *T. aestivum* which is found principally in beech woods. It is bluish black, roundish and covered with coarse polygonal warts, the gleba is white when immature, then ochraceous and finally brownish with whitish, branched, labyrinthine markings It was formerly hunted on the south downs by the aid of mongrel terriers and was sold in Covent Garden. (J. RM.)

TRUJILLO or TRUXILLO, a seaport on the Atlantic coast of Honduras, department of Colón, in 15° 54′ N. and 86° 5′ W. Pop (1950 census) 3,265. The harbour, an inlet of the bay of Honduras, is sheltered on the north by the promontory of Cape Honduras; it is deep and spacious, but insecure in westerly winds Mahogany, dye woods, sarsaparilla, cattle, hides and fruit are exported, grain, flour, hardware and rum are imported. Trujillo was founded in 1524, and became one of the most prosperous ports of the new world, and the headquarters of a Spanish naval squadron.

During the 17th century it was frequently and successfully raided by buccaneers, and thus lost much of its commerce, which still more, in modern times, has been diverted to Puerto Cortés and to Puerto Castilla, across the bay.

TRUJILLO, the capital of the department of La Libertad in northern Peru, lies some 300 mi. up the coast and north of Lima. It is Peru's second oldest Spanish city, having been founded by Pizarro's orders in 1535 and named in honour of his birthplace in Spain. In size it is the fifth city of Peru (pop 47,728 in 1950) and the most important city in the north. In 1945 Trujillo became the seat of a Roman Catholic archdiocese. The city is 4 mi from the coast at its nearest point and 8 mi. by rail from Salaverry, its port.

Trujillo serves the important mining region of Quiruvilca (copper) and Milluachaqui (gold and silver), exploited by the Northern Peru Mining and Smelting company, a subsidiary of the American Smelting and Refining Company of New York, and ships quantities of bar-copper, gold and silver ores, concentrates and precipitates It also serves two agricultural districts, that of the valley of the Macke river and of the valley of the Chicama, the last-named being probably the most important sugar cane growing district of Peru. Much of the traffic that formerly passed through Trujillo from the Chicama valley was diverted to Puerto Chicama (formerly known as Malabrigo).

Though Trujillo is in the tropics, the climate is distinctly temperate because of the Humboldt current that sweeps up the western coast of South America from the Antarctic ocean to Punta Pariña, Peru, where it flows out to sea, the average temperature of this current being about 60° F. An extended observation of meteorological conditions at Trujillo shows a maximum temperature of 85° F. and a minimum of 55°, the mean variation between diurnal and nocturnal extremes being ten degrees. The region is

ordered shift from civilian to military production to make the U S. and its allies capable of resisting Russian attack.

As a further bulwark against the U S S R the United States inspired formation of the North Atlantic Treaty organization (NATO), consisting of the U S, Canada, Iceland and nine western European states On Dec 19, 1950. the NATO council approved the appointment of Gen Dwight D Eisenhower, then president of Columbia university, as organizer of a western European army under NATO auspices

On April 11, 1951, President Truman removed General MacArthur from his posts as commander of U S and U N forces in the far east. Truman justified his action on the ground that MacArthur's proposed tactical plan, which included bombing of Communist bases in North Korea and China, would have transformed a local conflict into a possible global war. Returning to the U S, MacArthur delivered a series of speeches attacking the administration's policies in the far east.

Domestic Problems; Decision Not to Run Again.—In view of unsettled conditions at home and abroad, Truman's election in 1948 had been a minor miracle of U S. politics. Powerful influences within the party, including political professionals and liberals, wanted to sidetrack him in favour of General Eisenhower. The election of Gov Thomas E. Dewey of New York, the Republican nominee, was forecast by almost every public-opinion poll and political prophet. But Truman made what he called a "whistle stop" campaign, appearing before thousands of voters in every section except the south. He assailed the Republicans as reactionaries and isolationists. His most effective sally, perhaps, was his reiterated declaration that "any workingman or farmer who votes against the Democratic party ought to have his head examined."

Truman received 303 electoral votes and Dewey 189, with 39 going to the States' Rights Democrats ("Dixiecrat") ticket, which was entered in the race as a southern protest against the strong civil rights plank in the Democratic platform. The "Dixiecrat" ticket was headed by J Strom Thurmond of South Carolina, with Fielding L. Wright of Mississippi the vice-presidential candidate

Congressional revelations of corruption and maladministration in several executive agencies, notably the bureau of internal revenue, the Reconstruction Finance corporation and the department of justice, embarrassed the administration in 1950–51. After defending his appointees, including Democratic National Chairman William M Boyle, Jr, for almost a year, the president discharged many high government and political officials He named Frank E. McKinney as Boyle's successor. He ordered Attorney General J Howard McGrath to "clean up" venal conditions among federal officeholders

On Nov. 1, 1950, President Truman was the object of an attempted assassination. He escaped unharmed One assassin was killed and the other wounded, one secret service guard was killed and two others were wounded. The would-be assassins, Griselio Torresola (who was killed) and Oscar Collazo, were Puerto Rican nationalists.

Truman's seizure of the steel industry April 8, 1952, to avoid a strike precipitated a grave constitutional issue which was settled only when the supreme court, by a vote of six to three, ruled that the seizure was unconstitutional.

Truman announced March 29, 1952, that he would not run for the presidency again, although he made another "whistle stop" tour of the nation in support of the unsuccessful Democratic nominee, Adlai E. Stevenson. (R. Tu.; X.)

TRUMBIĆ, ANTON (1863–1938), Yugoslav statesman, was born at Split. He became successively mayor of Split, and deputy for the city in the Dalmatian Diet, and after 1907 deputy in the Austrian parliament. In 1905 he and his fellow Dalmatians, Pero Čingrija, Smodlaka and Supilo, as delegates of the Croat National party, worked for the renewed co-operation between Serb and Croat, which culminated in the resolutions of Fiume and Zara in 1905, and in the parallel negotiations with the Magyar coalition parties.

In 1917 Trumbić and others negotiated, with the exiled Serbian government in Corfu and representatives of all the Serbian parties, the so-called "Declaration of Corfu," which provided the basis for a united Yugoslav state Trumbić met representative Italians in Dec. 1917 and March 1918, and shared in the arrangements for the congress of oppressed nationalities held in Rome in April In Oct. 1918 Trumbić was appointed foreign minister in the Yugoslav provisional government and peace delegate in conjunction with Pašic and Vesnić The Yugoslavs were obliged to come to a direct agreement with Italy, and the Treaty of Rapallo was signed in Nov. 1920.

Trumbić's long absence in Paris, coupled with the policy of abstention pursued by the Croat Peasant party under Radić, placed him at a fatal disadvantage when the question of the new constitution came up in 1921 The sudden *volte face* of Radić after the elections of 1925 left Trumbić somewhat isolated, as the leader of the newly constituted "Croat Federalist Peasant party."

TRUMBULL, JOHN (1750–1831), American poet, was born in what is now Watertown, Conn, where his father was a Congregational preacher, on April 24, 1750 At the age of seven he passed his entrance examinations at Yale, but did not enter until 1763; he graduated in 1767, remained at the college studying, and in 1771–73 was a tutor He spent a year in Boston in the office of John Adams, and after 1774 practised law in Connecticut He was state's attorney in 1789, a member of the Connecticut assembly in 1792 and 1800, a judge of the superior court in 1801–19, and finally a judge in the supreme court of errors. The last six years of his life were spent in Detroit, Mich., where he died on May 10, 1831. While studying at Yale he had contributed in 1769–70 ten essays, called "The Meddler," imitating *The Spectator*, to the *Boston Chronicle*, and in 1770 similar essays, signed "The Correspondent" to the *Connecticut Journal* and *New Haven Post Boy* While a tutor he wrote his first satire in verse, *The Progress of Dulness* (1772–73), an attack in three poems on educational methods of his time. His great poem, which ranks him with Philip Freneau and Francis Hopkinson as an American political satirist of the period of the Revolutionary War, was *McFingal*, of which the first canto, "The Town Meeting," appeared in 1776 (dated 1775). This canto, about 1,500 lines, contains some verses from "Gage's Proclamation," published in the *Connecticut Courant* for Aug. 1775; it portrays a Scotch Loyalist, McFingal, and his Whig opponent, Honorius, apparently a portrait of John Adams. This first canto was divided into two, and with a third and a fourth canto was published in 1782 After the war Trumbull was a rigid Federalist, and with the "Hartford Wits," David Humphreys, Joel Barlow and Lemuel Hopkins, wrote the *Anarchad*, a poem directed against the enemies of a firm central government.

See the memoir in the Hartford edition of Trumbull's *Poetical Works* (1820); J H Trumbull, *The Origin of "McFingal"* (Morrisania, New York, 1868), and the estimate in M C Tyler's *Literary History of the American Revolution* (New York, 1897).

TRUMBULL, JOHN (1756–1843), American artist, was born at Lebanon (Conn), on June 6, 1756, the son of Jonathan Trumbull (1710–1785), governor of Connecticut He graduated at Harvard in 1773, served in the War of Independence, rendering a particular service at Boston by sketching plans of the British works, and was appointed second aide-de-camp to Gen Washington and in June 1776, deputy adjutant general to Gen. Gates, but resigned from the army in 1777. In 1780 he went to London to study under Benjamin West, but his work had hardly begun when the news of the arrest and execution of Major André, who was deputy adjutant general in the English army, suggested the arrest of Trumbull as having been an officer of similar rank in the Continental army; he was imprisoned for seven months. In 1784 he was again in London working under West, in whose studio he painted his "Battle of Bunker Hill" and "Death of Montgomery," both of which are in the Yale School of Fine Arts.

In 1785 Trumbull went to Paris, where he made portrait sketches of French officers for "The Surrender of Cornwallis," and began, with the assistance of Jefferson, "The Signing of the Declaration of Independence," well known from the engraving by Asher B Durand. These paintings, with "The Surrender of

Burgoyne" and "The Resignation of Washington," were bought by the United States government and placed in the capitol at Washington, D C. Trumbull's "Sortie from Gibraltar" (1787), owned by the Boston Athenaeum, is now in the Boston Museum of Fine Arts, and a series of historical paintings, the "Trumbull Gallery," by far the largest single collection of his works (more than 50 pictures), has been in the possession of Yale college since 1831, when Trumbull received from the college an annuity of $1,000 His portraits include full lengths of General Washington (1790) and George Clinton (1791), in the city hall of New York—where there are also full lengths of Hamilton and of Jay; and portraits of John Adams (1797), Jonathan Trumbull and Rufus King (1800); of Timothy Dwight and Stephen Van Rensselaer, both at Yale; of Alexander Hamilton (in the Metropolitan Museum of Art, New York city, and in the Boston Museum of Fine Arts, both taken from Ceracchi's bust), a portrait of himself painted in 1833, a full length of Washington, at Charleston, S C.; a full length of Washington in military costume (1792), now at Yale, and portraits of President and Mrs. Washington (1794), in the National museum at Washington. Trumbull's own portrait was painted by Stuart and by many others. He died in New York on Nov 10, 1843

BIBLIOGRAPHY.—*See* his *Autobiography* (1841); J F Weir, *John Trumbull, A Brief Sketch of His Life, to Which is Added a Catalogue of His Works* (1901), and John Durand, "John Trumbull," *American Art Review*, vol ii, pt 2, pp 181–191 (1881)

TRUMBULL, JONATHAN (1710–1785), American political leader, was born at Lebanon, Conn, on Oct 12, 1710 He graduated from Harvard in 1727 and began the study of theology, but in 1731 engaged in business with his father. He next studied law, was elected to the assembly in 1773 and held public office almost continuously afterward. He served for 7 years in the assembly, being speaker for 3 years; for 17 years as county judge of Windham county, for 22 years (after 1740) as governor's assistant; for 2 years as deputy governor (1767–69); and for 3 years (1766–69) as chief justice of the colony. In 1769 he was elected governor and continued in office until his voluntary retirement in 1784. During the War of Independence he was a valued counsellor of Washington The story that the term "Brother Jonathan," a sobriquet for the United States, originated in Washington's familiar form of addressing him seems to be without any foundation. After the war Trumbull was a strong Federalist He died in Lebanon on Aug 17, 1785.

BIBLIOGRAPHY.—His public papers have been printed in the Massachusetts Historical Society's *Collections*, 5th series, vol ix, x (1885–88), and 7th series, vol ii, iii (1902). *See* I W. Stuart, *Life of Jonathan Trumbull, sen* (1859)

TRUMPER, VICTOR (1877–1915), Australian cricketer, was born at Sydney, N.S W., Austr., on Nov. 2, 1877, and died there June 28, 1915. His first appearance against England was in a second-class match against Stoddart's team in 1894–95. In 20 seasons of first-class cricket, 1894–1914, he made 17,000 runs for an average of 45.

TRUMPET, in music, a brass wind instrument with cup-shaped mouthpiece and a very characteristic tone. It consists of a brass or silver tube with a narrow cylindrical bore except for the bell joint, forming from one-third to one-fourth the whole length, which is conical and terminates in a bell of moderate diameter The tube of the trumpet is doubled round upon itself to form a long irregular rectangle with rounded corners A tuning slide consisting of two U-shaped cylindrical tubes fitting into each other is interpolated between the bell joint and the long cylindrical joint to which the mouthpiece is attached.

The mouthpiece consists of a hemispherical cup with a rim across which the lips stretch. The shape of the cup, and more especially of the bottom, in which is pierced a hole communicating with the main bore, is of the greatest importance on account of its influence on the tone quality and on the production of the higher harmonics It is recognized that the shallower and smaller the cup the more easily are the higher harmonics produced; the sharper the angle at the bottom of the cup the more brilliant and incisive is the timbre, given, of course, the correct style of blowing. The diameter of the cup varies according to the pitch and to the lip power of the player who chooses a cup to suit him

There are three principal kinds of trumpets (1) the natural trumpet, mainly used in cavalry regiments, in which the length of the tube and pitch are varied by means of crooks; (2) the slide and double-slide trumpets, in which a chromatic compass is obtained, as in the trombone, by double tubes sliding upon one another without loss of air; (3) the valve trumpet, similar in its working to all other valve instruments. The first and second of these alone give the true trumpet timbre. The tone of the valve trumpet approximates that of the cornet, nevertheless, it is now almost universally used.

BY COURTESY OF BOOSEY & CO., LONDON

THE TRUMPET, SHOWING THE MODERN FORM EQUIPPED WITH VALVES

In the trumpet the notes of the harmonic series from the 3rd to the 10th or 16th upper partials are produced by the varied tension of the lips and pressure of breath called overblowing. The fundamental and the second harmonic are rarely obtainable, and are therefore left out of consideration; the next octave from the fourth to the eighth harmonics contains only the third, fifth and minor seventh, and is therefore mainly suitable for fanfare figures based on the common chord The diatonic octave is the highest and its upper notes are only reached by very good players on trumpets of medium pitch

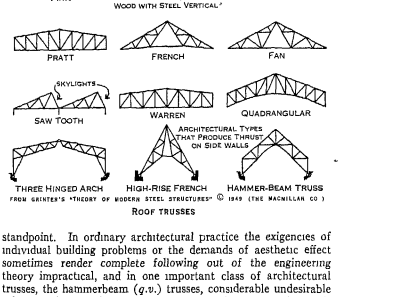
The lituus (*q v*) or cavalry trumpet of the Romans seems to have vanished with the fall of the Roman empire Its successor, the cavalry trumpet of the 15th and succeeding centuries, was evolved from the straight *buisne*, an instrument traced, by means of its name no less than by the delicate proportions of its tube and the shape of the bell, to the Roman buccina (*q v*). The bending of the tube of the trumpet in three parallel branches, thus creating its modern form, has usually been claimed for a Frenchman named Maurin (1498–1515). But the transformation was really made much earlier, probably in the Low Countries or north Italy; in any case it had already been accomplished in the bas-reliefs of Luca della Robbia intended to ornament the organ chamber of the cathedral of Florence where a trumpet having the tube bent back as just described is very distinctly figured. And this shape the instrument retained for more than 300 years. Later crooks and slides were introduced, then keys, and finally in 1815 Heinrich Stolzel made the first completely satisfactory chromatic trumpet by the invention of the ventil or piston (*See* VALVES, WIND INSTRUMENTS.)

TRUMPETER or TRUMPET BIRD, a South American bird of the Psophiidae family, so called from the sound it utters The family contains the single genus *Psophia* with half a dozen species, differing in little but colour and size The range of several species seems to be separated by rivers (Wallace, *Geogr. Distr. Animals*) and in this connection it may be observed that the birds seldom fly, though they run very fast. The best-known species, *P crepitans*, inhabits Guiana and is about the size of a large barn-door fowl, but with longer legs and neck The plumage is black with the exception of the green and violet reflections on the tips of the neck feathers and a brown and gray patch on the back The legs are bright green and the bird lays white eggs, about the size of a bantam's egg

Although the trumpeters must undoubtedly be accorded the rank of a distinct family, Psophiidae, like so many other South American birds they seem to be the less specialized descendants of an ancient generalized group—perhaps the common ancestors of the Rallidae and Gruidae. The structure of the trachea, though different from that described in any crane (*q v*), suggests an early form of the structure which in some of the Gruidae is so marvellously developed, for in *Psophia* the windpipe runs down the breast and belly immediately under the skin to within about an inch of the anus, whence it returns in a similar way to the

front of the sternum, and then enters the thorax Analogous instances of this formation occur in several other groups of birds not at all allied to the Psophiidae

TRUNK (Fr. *tronc*, Lat *truncus*, cut off, maimed), properly the main stem of a tree from which the branches spring, especially the stem when stripped of the branches; hence, in a transferred sense, the main part of a human or animal body without head, arms or legs. It is from this last sense that the term "trunk hose" is derived These were part of the typical male costume of the 16th century, consisting of a pair of large puffed and slashed overhose, reaching from the waist to the middle of the thigh, the legs clad in the long hose being thrust through them; the upper part of the body was covered by the jerkin or jacket reaching to the thigh (*see* DRESS). The word "trunk" as applied to the elongated proboscis of the elephant is the result of a mistaken confusion of French *trompe*, trump, with "trunk," meaning the hollow stem of a tree A somewhat obscure meaning of French *tronc* (*i.e.*, an alms box) has given rise to the general use of "trunk" for a form of travellers' luggage



TRURO, THOMAS WILDE, 1ST BARON (1782–1855), lord chancellor of England, was born in London on July 7, 1782, being the second son of Thomas Wilde, an attorney He was educated at St. Paul's school and was admitted an attorney in 1805 He subsequently entered the Inner Temple and was called to the bar in 1817, having practised for two years before as a special pleader Retained for the defense of Queen Caroline in 1820, he distinguished himself by his cross-examination and laid the foundation of an extensive common-law practice He first entered parliament in the Whig interest as member for Newark (1831–32 and 1835–41), afterward representing Worcester (1841–46). He was appointed solicitor general in 1839, and became attorney general in succession to Sir John (afterward Baron) Campbell in 1841 In 1846 he was appointed chief justice of the common pleas, an office he held until 1850, when he became lord chancellor and was created Baron Truro of Bowes, Middlesex He held this latter office until the fall of the ministry in 1852. He died in London Nov. 11, 1855. His son Charles (1816–91) succeeded as 2nd baron, but on the death of his nephew, the 3rd baron, in 1899 the title became extinct

Lord Truro was the uncle of JAMES PLAISTED WILDE, BARON PENZANCE (1816–99), who was appointed a baron of the court of exchequer in 1860 and was judge of the court of probate and divorce from 1863 to 1872. In 1875 he was appointed dean of the court of arches, retiring in 1899 He was created a peer in 1869, but died without issue and the title became extinct

TRURO, an episcopal city and municipal borough of Cornwall, Eng., 11¼ mi. N of Falmouth, on the Western Region railway. Pop. (1951) 12,851. Area, 3 8 sq mi It lies in a shallow valley at the junction of the Kenwyn and Allen at the head of Falmouth harbour. Truro (Trueret, Treurok, Treueru) was a comparatively small manor in Domesday held by Jovin of Count Robert of Mortain Its municipal charter dates from Richard Lucy, the chief justiciar who held the demesne lands. Reginald, earl of Cornwall, by an undated charter, added other privileges. Henry II confirmed them A new charter was given in 1589 and in 1877 the borough was declared a city. From 1295 to 1885 Truro had separate parliamentary representation, returning two members The cathedral church of St Mary was begun in Early English style in 1880 The episcopal see, founded in 1876, covers the whole of Cornwall, the Scilly Isles and three parishes in Devonshire. Industries include a pottery, sawmills, a biscuit factory and jam factories Small vessels can lie at the quays, though the harbour is dry at low water. China clay is the chief export.

TRURO, the chief town of Colchester county, Nova Scotia, Can., on the Salmon river, 1 mi. from the head of Cobequid bay and 61 mi. N. of Halifax by rail. Pop. (1951) 10 756. It is an important junction on the Canadian National and Dominion Atlantic railways, and the thriving centre of a lumbering and agricultural district It is the seat of the Nova Scotia Normal college and the Nova Scotia Agricultural college. Manufactures include clothing, condensed milk and building hardware.

TRUSS, in engineering and architecture, a combination of structural members, usually straight, and so arranged in one plane that by being connected at their ends they form a rigid frame on which to support a roof, floor, bridge or other similar weight In the theoretically perfect truss the component parts are so designed as to enclose between themselves rigid triangles and so arranged that every member is stressed only in the direction of its own length, either in compression or tension, with no bending forces present This, the controlling ideal of modern truss design, governs in the design of those trusses which are purely structural, or designed primarily from the utilitarian

ROOF TRUSSES

standpoint. In ordinary architectural practice the exigencies of individual building problems or the demands of aesthetic effect sometimes render complete following out of the engineering theory impractical, and in one important class of architectural trusses, the hammerbeam (*q.v.*) trusses, considerable undesirable side thrust is exerted upon the supporting walls or piers Although the basic principle of truss design, that of the rigidity of a triangle, is so simple, the scientific design of trusses is a matter of comparatively recent development, and in the greater number of classic, Romanesque and Gothic trusses, despite the ingenuity of their construction and, especially in late Gothic work, the beauty of their design and execution, it is only rarely, and as it were by accident, that a perfect triangulation of the members is achieved. The illustration shows a number of different kinds of roof trusses all made up of adjacent bars forming triangles.

A truss diagram is a graphic method of discovering the stresses in the component members of a truss, based upon the mechanical theory of the resolution of two angular forces into the diagonal of the parallelogram constructed upon them. (*See* BRIDGES, MECHANICS; ROOFS)

TRUST, INVESTMENT: *see* INVESTMENT TRUSTS.

TRUST and **TRUSTEES.** *Use in Early English Law.*—The use or trust is said to have been the invention of ecclesiastics well acquainted with Roman law, the object being to escape the provisions of the laws against mortmain by obtaining the conveyance of an estate to a friend on the understanding that they should retain the use (*i.e.*, the actual profit and enjoyment) of the estate. Uses were soon extended to other purposes. They were found valuable for the defeat of creditors, avoiding of attainder and charging of portions. A use had also the advantage of being free from the incidents of feudal tenure, it could be alienated *inter vivos* by secret conveyance, and could be devised by will. In 1535 the famous Statute of Uses (27 Hen. VIII, *c* 10) was passed, forming the basis of conveyancing until it was repealed in 1925 by the Law of Property act. The statute does not, however, apply indiscriminately to all cases, as only certain uses are executed by it. It does not apply to leaseholds or copyholds, or to cases where the grantee to uses is anything more than a mere passive instrument, *e.g.*, where there is any direction to him to sell the property. The

publicity of transfer, which it was the special object of the Statute of Uses to effect, was almost at once defeated

Trusts.—A trust in English law is defined in Lewin's *Law of Trusts*, adopting Coke's definition of a use, as "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which *cestui que trust* has no remedy but by *subpoena* in Chancery." The term *trust* or *trust estate* is also used to denote the beneficial interest of the cestui que trust A trust has some features in common with contract (*q v*); but the great difference between them is that a contract can only be enforced by a party or one in the position of a party to it, while a trust can be, and generally is, enforced by one not a party to its creation A division often adopted in modern textbooks and recognized by parliament in the Trustee Act 1850, is into *express*, *implied* and *constructive* An express trust is determined by the person creating it It may be either *executed* or *executory*, the former where the limitations of the equitable interest are complete and final, the latter where such limitations are intended to serve merely as minutes for perfecting the settlement at some future period, as in the case of marriage articles drawn up as a basis of a marriage settlement to be in conformity with them. An implied trust is founded upon the intention of the person creating it, examples of it are a resulting trust, a precatory trust, and the trust held by the vendor on behalf of the purchaser of an estate after contract and before conveyance A constructive trust is judicially created from a consideration of a person's conduct in order to satisfy the demands of justice, without reference to intention The law was consolidated by the Trustee Act 1893 and some subsequent amending statutes as the Law of Property Act, 1925

Who May Be a Trustee or *Cestui que Trust*.—The Crown and corporations aggregate can be trustees. Provision is made by the Municipal Corporations Act 1882, for the administration of charitable and special trusts by municipal corporations. There are certain persons who for obvious reasons, even if not legally disqualified, ought not to be appointed trustees Such are infants, lunatics, persons domiciled abroad, felons, bankrupts and *cestuis que trustent* Any one may be a cestui que trust except a corporation aggregate, which cannot be a cestui que trust of real estate without a licence from the Crown. For the Public Trustee, *see* below. The disabilities affecting some Roman Catholic charities were abolished by the Roman Catholic Relief Act 1926.

Creation and Extinction of the Trust.—A trust may be created either by act of a party or by operation of law. The Statute of Frauds altered the common law by enacting that all declarations or creations of trusts or confidences of any lands, tenements or hereditaments shall be manifested and proved by some writing, signed by the party who is by law enabled to declare such trust, or by his last will in writing, or else they shall be utterly void and of none effect. For the purpose of conveying or creating a legal estate they must be made by deed (Law of Property Act, 1925, s. 52). Interests created by parol are by will only (s. 54). Trusts arising or resulting by implication or construction of law are excepted, and it has been held that the statute applies only to real estate and chattels real, so that a trust of personal chattels may still be declared by parol. The declaration of a trust by the Crown must be by letters patent Trusts created by will must conform to the requirements of the Will Act. (*See* WILL) Except in the case of charitable trusts, the cestui que trust must be a definite person A trust, for instance, merely for keeping up family tombs is void By s. 10 of the Trustee Act 1893 (superseding Lord St. Leonards's Act of 1860 and the Conveyancing Act 1881), the surviving or continuing trustee or trustees, or the personal representative of the last surviving or continuing trustee, may nominate in writing a new trustee or new trustees On such appointment the number of trustees may be increased Existing trustees may by deed consent to the discharge of a trustee wishing to retire. Trust property may be vested in new or continuing trustees by a simple declaration to that effect Also a separate set of trustees may be appointed for any part of the property held on distinct trusts. Trusts created by operation of law are those which are the effect of the application of rules of equity. They include resulting and constructive trusts A resulting trust is a species of implied trust, and consists of so much of the equitable interest as is undisposed of by the instrument creating the trust, which is said to result to the creator and his representatives. An example is the purchase of an estate in the name of the purchaser and others, or of others only. Here the beneficial interest is the purchaser's. An example of a constructive trust is a renewal of a lease by a trustee in his own name, where the trustee is held to be constructively a trustee for those interested in the beneficial term Besides being duly created, it is necessary for the validity of the trust that it should be a lawful one. An unlawful trust is one which contravenes the policy of the law in any respect. Examples of such trusts are trusts for a corporation without licence, for a perpetuity, and for purposes subversive of morality, such as trusts for illegitimate children to be hereafter born Superstitious uses also fall under this head There are also certain trusts which are avoided by statute under particular circumstances, such as settlements in fraud of creditors (*See* BANKRUPTCY) The law cannot be evaded by attempting to constitute a secret trust for an unlawful purpose. If an estate be devised by words prima facie carrying the beneficial interest, with an understanding that the devisee will hold the estate in trust for such a purpose, he may be compelled to answer as to the secret trust, and on acknowledgment or proof of it there will be a resulting trust to the heir-at-law In the case of an advowson suspected to be held for the benefit of a Roman Catholic patron, there is a special enactment to the same effect. (*See* QUARE IMPEDIT.) The rules of equity in charitable trusts are less strict than those adopted in private trusts Charitable trusts must be lawful, *e.g.*, they must not contravene the Statutes of Mortmain; but a wider latitude of construction is allowed in order to carry out the intentions of the founder, and they will not be allowed to fail for want or uncertainty of objects to be benefited. The court, applying the doctrine of *cy près* (*q.v.*), will, on failure of the original ground of the charity, apply the funds as nearly as possible in the same manner. On this principle gifts originally made for purely charitable purposes have been extended to educational purposes Further, trustees of a charity may act by a majority, but ordinary trustees cannot by the act of a majority (unless specially empowered so to do) bind a dissenting minority or the trust property. A trust estate is subject as far as possible to the rules of law applicable to a legal estate of a corresponding nature, in pursuance of the maxim, "Equity follows the law." Thus trust property as assets for payment of debts, may be taken in execution, passes to creditors in bankruptcy, and is subject to dower and curtesy, to the rules against perpetuities, and to the Statutes of Limitation A trust is extinguished, as it is created, either by act of a party or by operation of law. An example of the former mode of extinction is a release by deed, the general means of discharge of a trustee when the purposes of the trust have been accomplished Extinction by operation of law takes place when there is a failure of the objects of the trust: *e.g.*, if the cestui que trust die intestate without heirs or next of kin Equitable interests in real estate in other countries are as a rule subject to the *lex loci rei sitae*, and an English court has no jurisdiction to enforce a trust or settle a scheme for the administration of a charity in a foreign country. An English court has, however, jurisdiction to administer the trusts of a will as to the whole real and personal estate of a testator, even though only a very small part of the estate, and that wholly personal, is in England (See *Ewing* v *Orr-Ewing*, L R 9, A C 34)

Rights and Duties of the Trustee.—The principal general properties of the office of trustee are these (1) A trustee having once accepted the trust cannot afterwards renounce (2) He cannot delegate it, but an inconvenience which formerly attached to dealings with trustees and trust property, in consequence partly of this rule, and partly of the liability of persons dealing with trustees to see that money paid to them was properly applied, was largely obviated by s 17 of the Trustee Act 1893 (replacing s 2 of the Trustee Act 1888), which in effect provides that a trustee may appoint a solicitor to be his agent to receive and give a discharge

for any money or valuable consideration or property receivable by the trustee under the trust, by permitting the solicitor to have the custody of and to produce a deed having in the body thereof or endorsed thereon a receipt for the consideration money or other consideration, the deed being executed or the endorsed receipt being signed by the trustee; and a trustee is not chargeable with breach of trust by reason only of his having made or concurred in making any such appointment; and the producing of any such deed by the solicitor is a sufficient authority to the person liable to pay for his paying to the solicitor without the solicitor producing any separate or other direction or authority in that behalf from the trustee (3) In the case of co-trustees the office must be exercised by all the trustees jointly (4) On the death of one trustee there is survivorship. that is, the trust will pass to the survivors or survivor. (5) One trustee shall not be liable for the acts of his co-trustee. (6) A trustee shall derive no personal benefit from the trusteeship. The office cannot be renounced or delegated, because it is one of personal confidence. It can, however, be resigned, and legislation has given a retiring trustee large powers of appointing a successor The liability of one trustee for the acts or defaults of another often raises very difficult questions. A difference is made between trustees and executors An executor is liable for joining in a receipt *pro forma*, as it is not necessary for him to do so, one executor having authority to act without his co-executor; a trustee can show that he only joined for conformity, and that another received the money The rule of equity by which a beneficiary who consented to a breach of trust was liable to indemnify the trustees to the extent of his interest has taken definite statutory shape in s 45 of the Trustee Act 1893 (replacing s 6 of the Trustee Act 1888), which enacts that when a trustee commits a breach of trust at the instigation or request, or with the consent in writing of a beneficiary, the High Court may, if it thinks fit, and notwithstanding that the beneficiary is a married woman entitled for her separate use and restrained from anticipation, make such order as to the court seems just for impounding all or any part of the interest of the beneficiary in the trust estate by way of indemnity to the trustee The rule that a trustee is not to benefit by his office is subject to some exceptions. He may do so if the instrument creating him trustee specially allows him remuneration, as is usually the case where a solicitor is appointed. The main duties of trustees are to place the trust property in a proper state of security, to keep it (if personalty) in safe custody, and properly to invest and distribute it. A trustee must be careful not to place himself in a position where his interest might clash with his duty. As a rule he cannot safely purchase from his cestui que trust while the fiduciary relation exists between them. Investments by trustees demand special notice The Trustee Act, 1925, has consolidated the law on this point, and provides, as it were, a code or charter of investment authorizing trustees, unless expressly forbidden by the instrument (if any) creating the trust, to invest trust funds in various modes, of which the more important are as follows. In any of the parliamentary stocks or public funds or government securities of the United Kingdom, in real or heritable securities in Great Britain; in stock of the Bank of England or the Bank of Ireland; in India 7, 5½, 4½, 3½, 3 and 2½ stock; in any securities, the interest of which is for the time being guaranteed by parliament; in consolidated stock created by the Metropolitan Board of Works, the London County Council; debenture stock created by the Receiver for the Metropolitan Police District, Metropolitan Water stock; in the debenture or rent-charge or guaranteed or preference stock of any railway company in the United Kingdom incorporated by special act of parliament, and having during each of the ten years last past before the date of investment paid a dividend at the rate of not less than 3% on its ordinary stock and in certain other railway or canal stocks; in the debenture stock of any railway company in India, the interest on which is paid or guaranteed by the secretary of state in council of India; in the "B" annuities of the Eastern Bengal, the East Indian and the Sindh, Punjaub and Delhi Great Indian Peninsula and Madras Railways, etc.; and also in deferred annuities—comprised in the register of holders of annuity Class D, and annuities comprised in the register of annuitants Class C of the East Indian Railway Company, in the stock of any railway company in India upon which a fixed or minimum dividend in sterling is paid or guaranteed by the secretary of state in council of India, or upon the capital of which the interest is so guaranteed, in the debenture or guaranteed or preference stock of any company in Great Britain or Ireland established for the supply of water for profit, and incorporated by special act of parliament or by royal charter, and having during each of the ten years last past before the date of investment paid a dividend of not less than 5% per annum on its ordinary stock, in nominal or inscribed stock issued, or to be issued under any Act of Parliament or provisional order by the corporation of any municipal borough in the United Kingdom having, according to the returns of the last census prior to the date of investment, a population exceeding 50,000, or by any county council in the United Kingdom in certain water stocks; in securities authorized under the Colonial Stock Act, 1900, etc.; the Housing (Additional Powers) Act, 1919, loan securities issued by the Government of Northern Ireland, in any of the stocks, funds or securities for the time being authorized for the investment of cash under the control or subject to the order of the High Court. Trustees may from time to time vary any such investments for others of an authorized nature The statutory power to invest on real securities does not, of course, authorize the purchase of realty; but by s. 5 of the Trustee Act 1893 a power to invest in real securities (in the absence of express provision to the contrary) authorizes investment on mortgage of leasehold property held for an unexpired term of not less than 200 years and not subject to a greater rent than one shilling a year, or to any right of redemption or condition of re-entry except for non-payment of rent. The Trustee Act 1925 must be consulted for full information

The position of trustees in respect of what was frequently an undue personal responsibility for the administration of their trust has been much improved by s. 8 of the Trustee Act 1888 which enables an honest trustee to plead the Statutes of Limitation It has been decided that in the case of a breach of trust consisting of an improper investment of the trust funds, time begins to run in favour of the trustee from the date of the investment. Subsection (3) of the Judicial Trustees Act 1896 gives power to the Court further to relieve honest trustees for breaches of trust

Under the old law trustees could not safely advance on mortgage more than two-thirds of the actual value of agricultural land or one-half of the value of houses This "two-thirds rule" is now made statutory by s. 8 of the Trustee Act 1893 The same section protects trustees for not investigating the lessor's title when lending on the leasehold security, and for taking a shorter title than they might be otherwise entitled to on the purchase or mortgage of any property, if they act with prudence and caution. By s 9 (replacing s 5 of the Trustee Act 1888) trustees who commit a breach of trust by lending more than the proper amount on any property are excused from making good any more than the excess of the actual loan over the sum which they might have properly lent in the first instance (*See* generally the Trustee Act, 1925, for full information)

Rights and Duties of the Cestui que Trust—The cestui que trust has a general right to the due management of the trust property, to proper accounts and to enjoyment of the profits. He can as a rule only act with the concurrence of the trustee, unless he seeks a remedy against the trustee himself.

Judicial Trustees.—The Judicial Trustees Act 1896, inaugurated a semi-official system of trusteeship which was new in England, but had been known in Scotland for upwards of 150 years

Public Trustee.—A step further was taken by the Public Trustee Act 1906, which established the office of public trustee. By the act he is a corporation sole, with perpetual succession and an official seal and may sue and be sued under his official title. He may, if he thinks fit, act in the administration of estates of small value; as custodian trustee, or as an ordinary trustee; he may be appointed a judicial trustee, or administrator of a con-

vict's property. The law of trusts generally is applicable to him Full information as to the machinery and procedure of the office and the requirements necessary to obtain the services of the public trustee are obtainable on application to the Public Trustee Office, Kingsway, London

Scotland.—The history of the law differs considerably from that of England, though perhaps the position of the Scottish trustee is now not very different from that of the trustee in England The Statute of Uses did not apply to Scotland, since neither that nor any similar legislation was necessary in a system in which law and equity were administered by the same tribunals Trusts seem to have existed from time immemorial, and have been frequently regulated by statute The policy of the English Statute of Frauds was no doubt intentionally imitated in the Act 1696, c. 25, enacting that no action of declarator of trust should be sustained as to any deed of trust made for thereafter, except upon a declaration or back-bond of trust lawfully subscribed by the person alleged to be trustee and against whom or his heirs or assignees the declarator should be intended, or unless the same were referred to the oath of the party *simpliciter*. The act does not apply to all cases, but only to those in which by the act of parties documents of title are in the name of a trustee, but the beneficial interest in another The person creating the trust is called the *truster*, a term unknown in England. On the other hand the term *cestui que trust* is unknown in Scotland The office of trustee is prima facie gratuitous, as in England, it being considered to fall under the contract of mandate Some of the main differences between English and Scottish law are these. There is no presumption in Scotland of a resulting trust in favour of a purchaser. A trust which lapses by the failure of a beneficiary goes to the Crown as *ultimus heres*. The office of trustee is not a joint office, therefore there is no right of survivorship, and on the death of a trustee the survivors are incompetent to act, unless a certain number be declared or presumed to be a *quorum*, or the office be conferred on trustees and the accedors and survivors of them. Sometimes the concurrence of one trustee is rendered absolutely necessary by his being named *sine qua non*. The Court of Session may appoint new trustees, but generally appoints a judicial factor. There has been a considerable amount of legislation, chiefly in the direction of extending the powers of trustees and of the court in trust matters The powers of investment given to trustees are much the same as those allowed in England

United States.—It is generally true that the institutions of the English law were adopted bodily by the American colonists and became part of their jurisprudence modified only in such details as the exigencies of the new country demanded That this was true of trusts is, however, somewhat remarkable in view of American hostility during the 18th and early 19th centuries to the English system of equity jurisprudence. Indeed, several colonies possessed no chancery courts and not until the late 19th century had full equity powers been vested in State courts such as Massachusetts and Pennsylvania. Despite this, however, the trust as developed in England was well-known in America Remedies were administered in the absence of equity powers by law courts through their own legal forms. The institution consequently followed the English law in its major outlines and only the more important differences need here be considered

Passive trusts, in which the trustee performs no active duties but is simply a receptacle of the legal title, have under various theories ceased to exist for practical purposes, such a grant being deemed to vest the beneficiary with legal title. This result, reached in the American States through a judicial extension of the Statute of Uses or by local legislation, has in substance done away with all passive trusts except such resulting or constructive trusts as are created by operation of the law. Consequently for the effective creation of a trust it is necessary to impose affirmative duties of administration upon the trustee. Furthermore legislation in the several States similar to the provisions of the English Statute of Frauds requires trusts of real property to be in writing, though trusts of personal property unless created by will may be established by oral evidence.

Notable American legal doctrines concern the purposes for which trusts may be created. The spendthrift trust, a distinct American institution, seeks to secure the beneficiary against his own improvidence or incapacity by providing against alienation by anticipation of the trust income by the beneficiary either by his own voluntary act or *in invitum* by his creditors. The beneficiary cannot assign his right to receive future income nor can such income be subjected to the payment of his debts In England such trusts have been held invalid on the ground that it is against public policy to permit the ownership of property without permitting its alienation nor burdening it with liability for its owner's debts The majority of the American States have upheld the validity of such trusts, following the views enunciated by the Massachusetts court in *Broadway Nat Bank* v. *Adams*, 133 Mass. 170 and the Supreme Court of the United States in *Nichols* v *Eaton*, 91 U.S. 716 American legal doctrines surrounding the creation of charitable trusts have had a curious development. After intimating that their validity depended solely upon statute, the Supreme Court of the United States in the famous *Girard Will Case* (2 How. 127) concluded that the English Statute of Charitable Uses of 1601, 43 Eliz c. 4, was but declaratory of the common law and that such trusts were valid in the absence of legislation. Several State courts had heretofore repudiated the Statute, and the early legislation of these States failed to recognize the existence of charitable trusts. The failure of the famous Tilden trust devising several millions for charitable purposes to the city of New York under a decision of the Court of Appeals of New York led in 1893 to legislation in that State and similarly situated States restoring the old English system of charitable trusts. Indeed, since then the American courts have generally been more liberal than the English courts in their interpretation of what uses may be regarded as charitable. The policy involved in the English mortmain statutes finds its counterpart in different types of American statutes. Some restrict the amount of property a charitable corporation may hold; others prohibit a testator from giving more than a certain portion of his fortune to charity; and still others invalidate all gifts to a charity made within a brief period before the death of the donor.

There are numerous distinctions between English and American law concerning the rights of the trustee, of which the more important may be noted Unlike the English rule, the trustee even in the absence of a provision in the trust deed for remuneration, is entitled either by statute or under equity rules to a reasonable compensation for his services Such remuneration is commonly calculated on a commission basis, and the trustee possesses a lien upon the trust property for his services. Two or more trustees are entitled to one commission only. Strict rules, however, prevent a trustee from deriving any personal benefit from his trusteeship by action antagonistic to the best interests of the beneficiary The various States have many different rules governing the manner in which the trustee shall invest the trust property. The subject is largely controlled by legislation setting forth the specific types of securities which the trustee may purchase Corporate bonds of approved railroads and public utility companies are generally considered legal investments and a few of the States permit investments in the common stock of reputable corporations. Though mortgages upon real property are permissible investments, real estate as such is commonly considered too speculative and too unconvertible for purchase by the trustee. Two different rules prevail in America concerning the distribution of income of trust estates as between life tenants and remaindermen. When such income is represented by dividends, the rule of some States requires the payment of cash dividends to the beneficiary, whereas

stock dividends are to be held as capital Other States, however, regard the source of the dividend as the test, holding that all dividends whether in stock or cash accruing from profits earned subsequent to the creation of the trust are payable to the beneficiary.

Of interest also is the development in America of the institution of the trust as a means for aggregations of capital to carry on business. This development should be distinguished from the monopolistic illegal "trust." The legal trust contemplates contributions by a number of persons of capital to trustees who, under a declaration of trust executed to them, carry on the business for the benefit of such persons as are beneficiaries Transferable certificates are issued to the contributors and income from the conduct of the trust is paid to them in the manner of dividends. Since the organization is simply an adaptation of the common law trust no legislative authorization is a condition precedent to the right to carry on business in this manner. The declaration of trust also provides that title to the trust property and neither the trustees nor the shareholders are to be individually liable to creditors. The chief distinction between such an organization and a partnership is that the shareholders as beneficiaries cannot control the management of the business by the trustees, and if power to manage the business is vested in the shareholders or if they are permitted to appoint and remove trustees at will, the courts treat the organization as a partnership. Though this application of the trust is not unknown in England (see *Smith* v. *Anderson*, 15 Ch. D. 247), conditions peculiar to America have made for its extraordinary growth in the latter country. The device originated in Massachusetts, hence the term "Massachusetts trusts," due to the fact that the laws of that State did not allow corporations to deal in real estate Experience refined the forms of organization to permit their application to other enterprises, but until late years the device was not generally employed in other States. But when legislation during the beginning of this century sought to impose onerous burdens upon the doing of business in the corporate form, especially upon corporations of other States, the trust device was generally resorted to in order to avoid these burdens. The business trust thus became a familiar type of organization. It was expressly recognized by legislation in Oklahoma in 1919, and since then by a few other States Some State courts, however, have as yet failed to recognize the possibility of adapting the trust as a form of business organization.

Another adaptation of the trust for business purposes is the voting trust, a device whereby the stock of shareholders is deposited with a trustee for the purpose of controlling the policy of a corporation. The interests of the shareholders are commonly represented by transferable certificates Though in some States such trusts cannot be employed to control certain types of business, their legality is recognized provided that all shareholders shall be permitted to avail themselves of the trust agreement and provided that its purpose is to benefit all shares alike.

(J. M. LA.)

TRUST COMPANY is a corporation engaged in winding up estates, administering trusts and performing agencies for individuals, partnerships, corporations, associations and institutions both public and private, under authority of law. The trust company may be engaged exclusively in trust business or it may perform commercial banking functions as well as those of a savings bank.

In all of its purely trust functions, the trust company acts as a fiduciary for its customers in that it acts for the benefit of someone other than itself. It cannot delegate the performance of its duties.

In the United States, trust powers are granted to corporations by governmental authority; they are not implied rights. National banking institutions receive their trust powers from the federal government. Other corporations receive their trust powers from state governments Power to engage in trust business in one state does not carry with it power to engage in trust business in other states of the United States Each corporation must meet the requirements of the governmental authority under which it wants to do business Each state has the authority to determine the conditions under which a corporation may conduct a trust business within its borders.

In addition to its trust charter, each trust company must obtain a licence to operate National banks receive their licences to operate from the board of governors of the federal reserve system State banks apply to the state banking authority for their licences

Other requirements are imposed on corporations before they can engage in trust business. The laws of the various states are not uniform. Some require a minimum capital and surplus which is fixed according to the population of the city in which the corporation is located, while others base the requirement on the volume of the trust business of the corporation. Some states further require that a deposit be made with the proper state authority to protect the trust property. In some states a deposit of securities of a fixed amount permits the handling of an unlimited volume of trust business

The trust company renders three kinds of service for three distinct groups of persons. The three services are: distribution of property; administration of property; and custody and agency functions with respect to property These three services may be rendered for individuals, for business firms, or for public institutions For convenience, most trust companies classify their services as personal trusts and corporate trusts.

Personal Trusts.—The trust company serves individuals in many ways but its chief function is that of executor or administrator of estates. When a person dies, leaving property and a will that is admitted to probate, he often nominates a trust company to wind up his estate. The court of competent jurisdiction usually appoints the trust company so named and it is known as the executor of the estate. If an executor is not named in the will, or if the person so named is not appointed by the court, the court appoints someone to act Such a person is known as an *administrator with a will* Should the person who dies leaving property not make a valid will, the court appoints an *administrator*. The trust institution so appointed is known as the *administrator of the estate*.

The principal duties of the executor or administrator are to obtain *letters testamentary* or *letters of administration* from the court giving the trust company authority to settle the estate, assemble the assets of the estate, take such steps as are necessary to protect the assets, pay all just claims, and distribute the remainder to the heirs

Personal Trusteeships.—The administration of personal trusteeships constitutes the second main function of personal trusts. A trust exists when one person has legal title to property and another person has the beneficial ownership. Personal trusts are of two kinds, testamentary trusts and living trusts A testamentary trust is created by a person who leaves a will which transfers his title to property to one person to hold for the benefit of a third person or persons. A living trust is created when a person during his lifetime conveys title to property to another person to be held for the benefit of himself or a third person. These living trusts may be revocable or irrevocable. The living trusts are of several kinds.

Guardianships.—Under court appointment, trust companies serve individuals as guardians of property. In some states a trust company may also act as guardian of a person Guardianships of property arise when the court appoints someone to manage the property for an incompetent person. Such appointee is known as a guardian, trustee or conservator The incompetent person may be mentally incapable of managing his own property or he may be a minor.

A guardianship differs from a trusteeship in that under the former, the title to the property remains in the minor or the incompetent whereas under the latter the title resides in the trustee. The administrator of estates under guardianship is controlled by the statutes and court decisions of the state Under trusteeships the trustee derives his powers and duties from the trust instrument creating the trust.

Agencies.—The third principal function performed by trust companies for individuals is that of agent Agencies are created when one person authorizes another to act for him. The principal retains title to his property and may terminate the agency at any time. It is automatically terminated on the death of either the principal or the agent. Agencies are of many kinds but may be grouped under five headings:

safekeeping, custodianships, management agencies, attorneyships-in-fact, and escrow agencies

Safekeeping is the simplest kind of agency and involves the receipt of property or claims to property, care in its protection, and delivery upon order of the owner. No responsibility other than due care and diligence in the physical protection and delivery of the identical property is imposed

Custodianships constitute the next step beyond safekeeping. The custodian, in addition to receiving, caring for and delivering property performs many other duties set forth in the agreement. The custodian is expected to relieve the principal of the details connected with ownership.

Management agencies represent the third step in activity and responsibility under agencies in that the exercise of judgment is involved. In addition to the duties of safekeeping and custodianship, the management agent may be expected to render a multitude of services in which it must exercise the same kind of care and judgment that it would for property held in a trust account.

Attorneyships-in-fact arise from a written authorization by the principal conveying to the agent authority to perform certain acts Attorneyships-in-fact accepted by trust institutions do not involve the practice of law. These agencies may cover any business transaction which the principal has a legal right to perform.

Escrow agencies constitute the fifth agency function of trust companies. In performing this service the escrow agent acts as a stakeholder for two or more persons engaged in a business transaction. The agent exercises no discretion and assumes no responsibility other than following the instructions agreed upon

Corporate Trusts.—Corporate trusteeships are one of the principal services rendered by trust companies As corporate trustee, a trust company serves as trustee under bond issues It takes title to property under deed of trust from corporations which wish to sell notes or bonds The trustee holds title for the benefit of the noteholders or bondholders. The trustee certifies that each bond or note is one of a series issued under trust deed It protects against an overissue but does not guarantee the value of the security. As agent, the trust company acts as transfer agent or registrar. As transfer agent, it acts for corporation stock and registered bonds It also acts as transfer agent for many forms of business paper such as warrants for stock rights, voting trust certificates, and receivership certificates. As registrar, trust companies guard against an overissue by checking the certificates against the number of shares authorized When certificates are issued the registrar checks the old and new certificates Another function of the trust company is that of depositaryship These services are governed by the depositary agreement. The trust company accepts the securities, accounts for their safety, and delivers them on demand. Because of the vast detail involved in connection with the payment of dividends on stocks, interest on bonds, and the payment of matured issues, corporations appoint trust companies as paying agents Trust companies also serve corporations as custodians, management agents, escrow agents and attorneys-in-fact

In addition to their services for corporations and individuals, trust companies act as fiscal agents for governmental bodies, and for social institutions such as clubs, schools, churches and fraternal institutions.

(H. F. W.)

Historical Development.—The first trust companies in the United States were not chartered as trust companies originally but as insurance companies, trust activities remained secondary until, with the growth of wealth, the fiduciary services became of greatest importance, whereas insurance and annuity business was secondary By 1822 several companies were placing chief emphasis upon the fiduciary business Their development before the Civil War was slow, and by 1850 there were some 50 trust companies scattered throughout the commercial states Besides performing trust functions, some of these early trust companies operated as savings banks and provided safe deposit facilities. The charters of trust companies around the middle of the 19th century included these functions specifically.

With the development of a national banking system and a national currency after 1863, trust companies grew in importance and number and developed into powerful financial institutions. In the 25 years following the Civil War great changes took place in the activities of trust companies Whereas state banks were decreased in number and in extent of their operations as a result of the National Banking act of 1863, trust companies began to grow in number and resources. The regulatory measures provided in their charters were regulatory in name only. Deposit banking and discounting activities became the chief functions of trust companies The old alliance with insurance and annuity business was completely dropped and fiduciary business began to occupy a rank of secondary importance.

After 1880, trust companies became commercial banks in reality even though not always in name As a result of the growth of trust companies, banks complained that they were being discriminated against and clamoured for state supervision of trust companies. The three chief complaints were that trust companies were not subject to taxation as were banks; that trust companies kept no reserves, but depended on the banks for cash and clearing service; and that trust companies were not subject to state supervision and regulation in their operations, which constituted a danger to sound banking After many heated controversies measures of relief were started. New York enacted a trust company reserve law in 1906, but the law was changed in 1908 and trust companies were brought under the same law as banks Other states followed suit. When the Federal Reserve act was passed in 1913 the same powers to act in a fiduciary capacity as were enjoyed by trust companies were extended to commercial banks The act also provided that trust companies could become members of the reserve system. Since then trust companies have become almost indistinguishable from commercial banks, though they place a heavier emphasis on fiduciary business than do most commercial banks By 1939 about one-third of the country's banking resources were in the hands of trust companies

(B. H.)

TRUSTEESHIP SYSTEM: *see* MANDATE; UNITED NATIONS.

TRUSTS. The term "trust" is a convenient though mostly inaccurate label popularly applied to any large business concern, or amalgamation or association of business concerns, which exercises some degree of monopolistic power over output and prices in the industry with which it is connected. The "trust," as it first appeared in America in the '80s, was a form of organization in which the shareholders of a number of enterprises agreed to assign the whole of their stock to a small board of trustees, receiving in exchange trust certificates representing the valuations of their properties This particular way of bringing a number of rival businesses under one direction has no particular significance nowadays, and it is but by historical accident that it has given its name to something much wider than itself, but the term has become established, and when a British official committee was appointed in 1918 to enquire into all forms of trade organization and combination it was officially designated "The Committee on Trusts." The subject of this article, then, is not "trusts" in the derivational sense, but the whole movement of which the "trust" proper was and still is one example That movement has two main aspects It entails, in the first place, a change in the size of the business unit, a change from a multitude of small separately controlled businesses to a few big businesses, and in the second place a change in the basic principle upon which industry is conducted, a change from competition as the ruling factor in the fixing of output and prices to deliberate control, fortified by monopoly, on the part of the manufacturing or commercial interests concerned.

From Competition to Combination.—The system under which goods are produced, distributed and bought is still commonly referred to as the "competitive system," but for the last half century and longer the economic order has been changing and the assumptions upon which it was held that, normally, supplies, prices, profits, and wages are determined by the free play of competition are no longer entirely valid For an account of the competitive system and the nature of the change from competition to combination the reader should see the article COMPETITION IN INDUSTRY, where the virtues and triumphs of competition are extolled, but it is shown that there are fields in which competition is detrimental to efficiency and obstructive to progress, and also that, when industrialists wake up to the fact that there is an easier way than competition to the ends they pursue, competition frequently gives place to combination.

FORMS OF COMBINATION

(1) **Gentlemen's Agreements.**—Industrial combination in the dual sense of the replacement of many small firms by a few large firms and the substitution of concerted control for competition takes a wide variety of shapes. In its simplest and most elusive form there is no outward sign of change but a few business rivals meet from time to time and reach an "understanding" in regard to prices, output, division of business, etc In effect, the competitors agree not to compete: that is all. Nothing is put on paper; a gentleman's word is as good as his bond. Such understandings are fairly common among local coal dealers, carriers, shopkeepers, etc, and are no less a figure in industrial diplomacy on the largest scale The reader should see the article GENTLEMEN'S AGREEMENTS.

(2) **The Trade Association.**—A more advanced kind of combination is that in which a large proportion of the manufacturers or traders in a particular line of business form a trade association.

Many such associations go no further than to compile and exchange statistical information. Others openly or secretly adopt

measures designed for the purpose of regulating the trade. In the latter instance, as in the "Gentlemen's Agreement," there is exemplified one only of the two aspects of combination: there is no change in the size of the business unit, but something has happened to the competitive principle by which the relations of the various firms are supposed to be governed. Associations for the regulation of trade are associations for the limitation of competition. This can be effected in a variety of ways, by fixing uniform prices, by apportioning and controlling output, by supervising tenders, by dividing up the market.

For an account of these bodies, which are to be found in almost every branch of industry in Great Britain and America, and indeed in all industrial countries, the reader should see the article TRADE ORGANIZATION. The economic effects of the limitations upon competition effected by these associations, and the social and political problems to which the possibilities of abuse of their powers give rise, will be discussed at a later point in the present article.

(3) **The Consolidation.**—It frequently happens that two or more previously independent business concerns are permanently *amalgamated into one* large concern under more or less completely centralized direction and control. The consolidation may be a coalition of equals, or it may be the result of a powerful concern buying up one or more smaller rivals; it may have been engineered by outstanding personalities within the industry, or it may be the result of operations promoted by outside financiers; the previously independent businesses may continue to operate to all outward appearance as though they were still independent, or some of them may disappear as separate entities, their goodwill and business passing to more efficient establishments within the amalgamation. According to their origin, scope, and manner of operation, distinguishing names have been given to these conglomerate bodies. The term "combine" is frequently used in Great Britain, generally to designate a merging of firms in the same line of business at the instance of some dominant concern or group among their number. The term "merger" is more usually used in the United States in much the same sense. The term "*Kartell*" is widely used to denote the specifically German type of joint selling organization (*See* CARTEL.) The term "trust," as already mentioned, has particular application to the former American plan of assigning the stock of the associated enterprises to a body of trustees. There is no need, for present purposes, to examine more closely these differences in financial structure and control. The terminology is largely arbitrary, and the distinctions often without real significance.

Consolidations may, however, logically be divided into two distinct classes. The "vertical" consolidation results from a merging of firms engaged in the production of a commodity at successive stages of manufacture; *e.g.*, coal and iron mining, pig iron, iron and steel, and ships. The "horizontal" consolidation, on the other hand, results from the merging of firms engaged in the same line of business at the same stage of production, *e.g.*, the firms engaged in the bleaching and dyeing industry or those engaged in the manufacture of cement.

A consolidation may attain such size and power that it represents within itself the greater part, locally, nationally, or maybe internationally, of the particular line of business in which it is engaged, and is able within limits to control the output of the industry and dictate the prices at which its particular type of goods shall be sold. The phenomenon and the problem are only formidable where the consolidation is on at least a national scale.

Multiple Directorships; Banking Control.—Among a miscellany of forms other than those already named, taken by the movement under discussion, two, which are of far greater import than might at first sight appear, call for specific mention. The first of these is the practice of one person holding directorships in a number of ostensibly competing firms or in firms engaged in mutual trade. Cases of persons holding a dozen directorships are common; and it is on record that as many as thirty-two directorships, including thirteen chairmanships and three positions of managing director, in businesses of the first order of magnitude concerned not only with manufacture but also with banking, shipping, railways, and telegraphs, have been simultaneously held by one person. The same phenomenon appears in more systematic guise where arrangements for the collaboration of erstwhile competing firms take the form known as "interlocking directorates" in which an interchange of shares is accompanied by arrangements whereby the directors of one concern sit upon the board of another. Where these conditions obtain, it is evident that the idea of competition in its old crude sense must be modified. The second is the control exercised over a large part of the industrial field by the great banks. It is not suggested that the details of prices, output, and marketing are matters with which the banks concern themselves, but their influence over the industrial and commercial policy of their clients is hardly in dispute, and that influence has its reflex upon the policy of its clients towards each other (*See* BANKING AND CREDIT.) Throughout any survey of tangible consolidations and trade associations these less tangible influences must be kept in mind if a comprehensive idea of the extent of trade combination is to be obtained.

National Characteristics.—The combination movement has accommodated itself in each country to national conditions and characteristics. In the United States, the size of the national market, and the singular uniformity in the goods required by American consumers, were both favourable to centralized large-scale production. The importance of rail transport costs as an element in total selling costs and the monopolistic position of certain main railroads gave added cause for collaboration among manufacturers with a view to collective bargaining with the railroad interests. These circumstances, together with a national zest for power and masterdom, conduced when time was ripe to a rapid growth of great industrial consolidations. In the United Kingdom, great consolidations wielding monopolistic and political power have not, in general, been so formidable as in America, nor have British associations of independent manufacturers developed so fully the range of activities displayed by such organizations in Germany. The movement toward industrial combination in the United Kingdom has been relatively more cautious and less spectacular than elsewhere. The reasons for this would appear to be partly the deep-rooted individualism of the British manufacturer and partly the greater difficulty of establishing monopolistic consolidations in a country where many of the principal industries are widely dispersed, where the raw materials of most of the great industries are drawn from world-wide sources, and where, for many decades, such shelter as monopoly might obtain from protective import duties was not available. None the less, combination has replaced or minimized competition over a great part of the industrial activity of the United Kingdom. In Germany, the local concentration of the coal and iron industries, the protective policy, the state-ownership of the Prussian railways, and the inter-relations of industry with government, all contributed to the emergence of a special type of trade combination in the form of a joint selling organization between independent concerns in the same line of business empowered to fix and maintain prices and to allot the participation of each independent producer in the aggregate output. For this German type of combination the reader should see the article CARTEL.

Industrial Occurrence.—It would be difficult to lay down any rule as to the industries which are most susceptible to combination or have travelled farthest along that road; but a few generalisations can be made. Industries engaged in supplying the need for a standard unvarying product—*e.g.*, steel bars and rails, sewing cotton, cement, salt, sugar, tobacco—invite combination more than do industries engaged in miscellaneous and varying production, such as general engineering and shipbuilding. Manufacturing enterprises requiring much capital for their establishment, or which can operate much more economically with expensive plants are, in general, more easily collected into large aggregates by the instrumentality of high finance and are more secure against sporadic competition than are industries which require little capital. Local proximity has been a factor of some importance in certain cases in facilitating centralized control; but improvements in transport and communication are minimizing this factor. Patents have formed the bed-rock of combinations in some industries *e.g.*, electrical, chemical, and shoe-machinery;

and natural monopoly has supported others. In general, manufacture lends itself to consolidation much more than agriculture; but combination plays an important part in the marketing of agricultural products For many years, retail distribution lagged behind manufacture as a subject for combination, but the last twenty years has seen an immense increase in the multiple shop or chain store Indeed, no array of purely economic factors will explain why combination has developed much further in some industries than in others; why, for example, soap, cocoa and sewing cotton should be represented in Great Britain by vast establishments, why shipbuilding and coal-mining should have stood so much aloof from the general tendency The present industrial spread of the movement would appear to have depended, as much as on anything else, on the chance emergence in certain industries, at the critical moment, of dominant personalities who have conceived great plans and carried them through. Where the right man with the necessary powers has been lacking at the propitious moment combination has had to wait

The growth and present existence of trusts in the United States has been very largely conditioned by legislation. The passing of the Sherman Act of 1890 necessitated the abandonment of the trust proper and led to the adoption of the method of complete amalgamation either by outright purchase or by the formation of holding companies This process of consolidation has proceeded very rapidly, with the result that a wide range of American industrial production has come to be under the dominion of giant concerns, some of which exercise considerable monopoly power Among concerns dominant in their respective industries are the United States Steel Corporation, the Aluminum Company of America, the Allied Chemical and Dye Corporation, the American Radiator Corporation, the Corn Products Refining Company, and the Eastman Kodak Company In the electrical, chemical, cement, oil seed, meat, shoe machinery, and non-ferrous metal industries, to name but a few, great consolidations play important parts. In the United Kingdom consolidations of such a size as to be capable of exercising some degree of monopolistic power also exist in the main branches of manufacture. In the cotton branch of the textile industry Messrs J & P Coats and The Fine Cotton Spinners' and Doublers' Association are of long standing; and two great post-war amalgamations are The Amalgamated Cotton Mills Trust and Crosses and Winkworths In the woollen and worsted industries combination has taken the form rather of association than consolidation, but Woolcombers Ltd is an amalgamation dating back some years, while since the World War large amalgamations have been formed in the worsted spinning and knitting wool spinning sections of the industry Outstanding in the bleaching, dyeing, printing and finishing industries are the Bradford Dyers' Association, the Bleachers' Association, the Calico Printers' Association, the British Cotton and Wool Dyers' Association and the English Velvet and Cord Dyers' Association In the chemical industry Brunner Mond and Company, the United Alkali Company, Nobel Industries and British Dyestuffs were amalgamated in 1926 into one great undertaking; Lever Brothers, the Salt Union, and Borax Consolidated, are each dominant in their respective branches of industry. In the coal industry, amalgamation has not proceeded far, except in South Wales, where there are two large groups of anthracite collieries, merged under Amalgamated Anthracite Collieries Ltd and United Anthracite Collieries Limited. In the iron and steel industry, combination by terminable association has been accompanied by great concentrations of capital, such as Dorman Long and Co., Bolckow, Vaughan & Co, Baldwin's Ltd, The Ebbw Vale Co and Guest, Keen and Nettlefolds The engineering and shipbuilding industries, again, present a network of terminable associations studded by large consolidations. Foremost among these are Vickers Ltd., Armstrong Whitworth & Co., Cammell Laird & Co. and John Brown & Co, but a score more could be quoted within almost the same range of importance. In other industries examples of dominant consolidations may be found, notably in matches, glass, bottles, electric lamps, machinery and tobacco.

International Combinations.—From combines of national range and consolidations of national magnitude it is a natural step to agreements and amalgamations on an international scale. It has been estimated that there were in existence before 1914 114 international associations, chiefly in the coal, ores, metal, transport, chemical, textile, pottery, paper and electrical industries The object of the majority of these organizations was the regulation of competition, and especially the exclusion of foreign competition from the respective home markets of the participants and the division and demarcation of sales territories, but some of them regulated prices, credit terms and selling practices generally among their members and in a few cases there were arrangements for the exchange of patents or knowledge of technical processes. The outbreak of war in 1914 broke up most of these international groups, but since 1918 some have been re-formed and others are in process of formation or re-formation Among these the International Rail Makers' Association is one of the earliest, having been first formed in 1884 by British, German and Belgian steel manufacturers for the purpose of dividing up export orders and securing the home market to the home manufacture. The association was re-constituted in 1926 under the name European Railmakers' Association. The pool formed by the French, German, Belgian and Luxembourg steel makers in 1926 provides for the allocation of output quotas among its members with penalties for exceeding the quota and compensations for keeping below it. Associations existed before the war to regulate the international relations of manufacturers engaged in the production of galvanized steel, tubes, pipes, rods, wire nails and enamel ware, and many of these have been or are being re-formed A copper syndicate comprising producers responsible, it is said, for some 90% of the world output and intended to control prices and reduce the number of middlemen was formed at the end of 1926 Potash, electric lamps, explosives, glass bottles and gas mantles are the subject of other agreements among the principal manufacturers in the various countries In addition to these international associations, agreements, cartels, or combines there were built up before the World War a number of giant consolidations of wide scope. In petroleum, the world trade is largely dominated by two enormous groups, the Standard Oil group and the Royal Dutch Shell group These, in collaboration, control something less than half the world's production, but a far greater proportion of international trade. In tobacco, the export trade of America and Great Britain is largely in the hands of the British-American Tobacco Company.

Relative Extent and Trend of Combination.—The degree to which combination has supplanted competition as the ruling factor of business operations must not be exaggerated. Even in the most powerfully organized industries competition plays its part with fitfully recurring intensity; while there are still numerous industries (*e.g.*, coal, shipbuilding, textile manufacturing, as well as a host of minor industries) in which the concerted control of output or prices or the concerted direction of industrial policy has made relatively little headway Under the influence of conditions during the World War, not only were numbers of listless associations galvanized into great activity and enterprise, but many new associations were formed Also, one effect of the excess profits tax was to encourage the buying up of unprofitable businesses by prosperous concerns, for such purchases were in effect paid for by moneys which would otherwise have gone in excess profits duty to the revenue For this and other reasons, the war period was one of unusual increase in the number of amalgamations Since the war, the impetus has been towards amalgamation rather than association; indeed trade associations have been through a difficult time, and several have dissolved The tendency is still toward large-scale amalgamation, and the economic and financial system appears to furnish little incentive for a great consolidation to dissolve into its constituent elements It is an old American aphorism that "you cannot unscramble eggs"

The Advantages of Combination.—Great possibilities of industrial and commercial improvement lie beyond the confines of free competition, and are only to be realized by combination in one or other of its several forms; by informal consultation and co-operation, by formal association, or by actual amalgamation. Only from the latter proceeds in full measure the advan-

tage that may follow from extending over a wide area the intelligence and control of technicians and administrators of outstanding ability such as only a large undertaking can afford to retain, and only the consolidation can order with plenary powers the policy of the industrial block over which it exercises authority, and can acquire control of the sources of raw material and an influential interest in the means of transport, but associations as well as consolidations can effect many improvements and economies along the whole line of manufacture and sale. By the consolidation, purchases of material and components can be made in gross instead of in detail, with the advantages of better selection, better terms and lower transport charges; middlemen can be side-stepped and, as already stated, the control over the sources of material can be acquired The association is not entirely powerless in these matters, for it can assist members to better buying by collecting and distributing information on the point As regards manufacture, it is possible under combination to arrange for a standardizing of parts and sizes throughout the industry, whereby production can be greatly cheapened and the parts of one maker made interchangeable with those of another Again it is possible to arrange that instead of every firm trying to cover the whole ground, each shall devote itself to some particular section, and install specialized equipment for its own section and for that only, in which case wasteful duplication can be avoided and specialized skill developed; or, where other conditions prevail, it is possible to bring equipment and inside organization throughout the industry to a uniformly high level Further, whereas under free competition the firms in one district may be working overtime while those in another district are on short time, it is possible through combination to maintain something like an equal distribution of work and to control orders so that the volume of work does not fluctuate so greatly from one period to another

The economies in the matter of distribution to be achieved by associations and combines need little demonstration. Critics of the competitive system have often pointed out the wastefulness of the "five milkmen in one street." The economic waste of numbers of rival travellers, each seeking to frustrate the efforts of the rest, and of competitive advertisements which cancel each other out, has long been a subject of comment. But only by some form of understanding or concerted arrangement of monopoly can such wastes of competition be eliminated Moreover, for a country carrying on a large export trade, representation in foreign markets is a matter of primary importance, and it has become increasingly apparent that independent manufacturers, if they combine for nothing else, must combine for the purpose of pushing their wares abroad if they wish to keep and extend their foreign connections

With these advantages that combination alone holds out goes another—the freer exchange of knowledge. Under competition, every one of a host of small manufacturers works out his own problems, evolves his own methods and processes, and "keeps what he knows to himself." When a combine or a consolidation is formed, this secrecy is ended, and anything worth imitating at one branch is available for all the others Associations do not always adopt the policy of "open doors" as between the members, but many of them go a long way in that direction, and the regular meetings conduce to a friendly atmosphere in which ideas are exchanged. The two essentials of the healthy rivalry which advances, as distinct from the jealous competition which obstructs, are a common basis of comparison and the pooling of data. With combination it is possible to arrange for a uniform system of records throughout an industry and for the circulation of cost-sheets showing what has been achieved by the most efficient firms. With such a sheet before him the less efficient member can see precisely where his methods are faulty and can set to work to improve them.

Possible Losses from Combination.—Against these possible gains on the score of productive and distributive efficiency must be set some possible losses. Where an industrial unit grows beyond the compass of one man's personal detailed direction, "system" must be introduced and system can degenerate into bureaucracy and red tape What is gained in power and knowledge at the centre may be lost in freedom and strength at the circumference, and the over-grown unit is in constant danger of becoming inefficient and reactionary. Again, under the shelter of monopoly a comfortable somnolence may descend upon the giant concern Since fear of change is a well-known characteristic of large administrations, the large business unit may become stagnant and antiquated, especially if its control falls increasingly into aged hands

Probably the most serious objection to combinations and consolidations is that they tend to establish rigidity in the prices of their products When, after a boom, optimism gives way to pessimism and, as a result, demand slackens greatly, most highly concentrated industries follow the policy of maintaining their selling prices at boom levels. The great holding company finds it feasible to follow this policy because it is in a strong financial position. Unfortunately, the result of maintaining selling prices in the face of weakening demand is to reduce sales volume, and such a reduction almost inevitably leads to the discharge of workers, a reduction of their buying power, and intensification of the forces leading to depression

However, popular opposition to trusts, combinations, and holding companies arises mainly from the belief that they will acquire monopolistic powers and will then raise the prices of their products far above the levels prevailing under free competition It is undoubtedly true that concentration of control in any industry brings in its train the danger of monopolistic power being used to exact monopolistic prices and conditions from the public

The problem for all industrial communities is therefore one of how to leave business concerns free to achieve the economies and other advantages of combination in so far as they are consistent with the general interest, and at the same time to provide means of curbing any tendency to use monopolistic power in a manner detrimental to the public and of penalizing those who do so use it.

Monopolistic Power.—Size is an important element in combination, but mere bigness is not disconcerting so long as competition remains effective as a curb upon the operations of the mammoth organization. The problems with which industrial communities are faced arise when the proportion of an entire industry covered by a great amalgamation is so large as to give it some degree of monopolistic power It has sometimes been laid down as a rough working rule that any consolidation or association which covers 80% of the output of an industry can dictate the prices at which the other 20% shall sell its competing products and so may be described as having an effective monopoly; but that formula cannot be applied indiscriminately, inasmuch as the limiting conditions of control vary greatly from industry to industry and in some industries very effective monopolies of merely local range may exist Confidence that the fear of competition can be relied upon to restrain tendencies to extortion on the part of even the most complete monopolies rests upon the belief that no association, combine, or consolidation, even though it has a monopoly, can for long put up prices above what is fair and reasonable, because, if it does, it will only "invite competition" - new people will come into the industry, competition will start afresh, and prices will fall But a powerful monopolistic firm or group can make it extremely difficult for any new entrant to get a footing It can monopolize raw materials, put pressure on merchants and retailers, or scare investors by hints of an under-selling campaign It can tie the distributing trade to it with deferred rebates and conditional commissions It can make conditions such that no one will enter the field against it except at great risk. It can in fact, if so inclined, build a stockade round its industrial territory. These are the instruments and devices by which a monopoly which is not complete and which is always in peril of a recrudescence of competition can maintain its dominance. For a fuller statement of the history, nature and significance of monopoly the reader should consult the article MONOPOLY. The practical outcome of the principles there expounded, as evinced in the case of the great consolidations and powerful associations, are dealt with in this article.

Industrial States.—It must be accepted that there exists a

tendency to form great consolidations representing whole branches of industry, and that such consolidations, could they be successfully organized, would have it in their power to effect great improvements in the lay-out and organization of the industry and to cut out much of the friction, waste, and overlapping which is often due to competition.

It has at the same time to be borne in mind that, as these consolidations came into being, the old accepted basis and operating principle of industry would undergo a radical change, being completely revolutionized. Industries would have become corporate bodies with monopolistic powers, in each of which a central intelligence would direct policy and ordain what supplies and prices should be. A consolidation representing the greater part of an industry, with command or influence over the sources of material and the channels of the distributing trade, would be a close corporation from which would-be intruders could be excluded.

It is clear that, if this stage was reached, governmental control of the industry would be inevitable, for no government can tolerate within its jurisdiction such a powerful rival. Were the leading industries all to become controlled by various powerful combinations the natural outcome would seem to be the formation of a corporative state such as that organized in Italy by Mussolini

Effects of Combinations: General.—It is in the nature of things not possible to prove conclusively the effect of combination upon the well being and prosperity of an industry or upon the volume of its output or the prices charged to customers. It is, obviously, possible to trace, in very many cases, the course of prices and profits before and after the forming of a particular consolidation or association, but from such surveys there is always lacking a knowledge of what prices and profits would have been had no combination been formed Further, it does not follow that an increased level of prices and profits, if proved, is of necessity an evil There have undoubtedly been, and will yet be, cases of industries working for long periods at less than their proper remuneration, and, from the social standpoint, it may be advantageous that an industry so placed should improve its position even at the expense of the rest The idea that the state of an industry under competitive conditions is an ideal standard from which to measure departures is not tenable in all cases

Effect upon Output.—The output of an industry depends upon the sales of its products, and these sales are largely conditioned by the prices at which the goods are sold. In general, and with very many qualifications and exceptions, the effect of combination upon output is a reflex of its effect upon price. So much are price and output recognized as interdependent that trade associations have a choice of two ways of "stabilizing" the industry, one being the fixing of prices and the other the regulating of output. Certain trade associations (*see* TRADE ORGANIZATION) attempted, for example, to regulate the output of the whole of their members by allotting to each a fixed percentage of the total production, whatever that total might be, with penalties for exceeding the quota and compensations for falling short of it.

It was held by the promoters of such "pooling" associations that the effect of the system is not to diminish output It is explained that, under the system, the total output is neither fixed nor even regulated: but is free to expand or contract in accordance with the total demand. It is difficult, however, to accept this view without some reservations. Since those who increase their output beyond the average are penalized, and those who fall below the average are rewarded, it would appear that the aggregate output must tend to be less than it would have been in the absence of any "pool." Yet such statements as "there has never been a time when we have failed to supply the utmost demand of the market" are doubtless made in good faith and have a certain truth What happens is that, under the influence of the penalties and rewards, prices rise, and though the whole demand at the increased price may be met, it is a demand depressed to some extent by the greater costliness of the article. This appears in every way likely to be the immediate effect of the pool system; but against it may be set the consideration that, in the long run, the gains of steady and equalized production in the various works composing the industry and the greater efficiency due to the removal of obstacles to the interchange of knowledge may accrue to the public in the shape of lower prices, whereupon sales may recover and output increase

Effect upon Quality.—It has been contended, and with some truth, that the fixing of a uniform price at which all establishments in a given branch of industry shall sell their products does not mean an end of competition but rather a change-over from competition in price to competition in quality Differences in price are more evident than differences in quality, and are apt to affect the judgment more The difference between £1 and 19/– in the price of an article is a plain matter of five per cent· the difference of five per cent in quality is less easily discernible. The immediate effect of the standard uniform price for various makes of the same article is undoubtedly to turn attention at once to differences other than price, and it may be accepted as usually the case that the establishment of uniform prices is followed by a tendency to improvement in designs and quality and hence in value.

Effect upon Evolution of Industry.—According to the competitive principle industrial evolution proceeds in part by the ill-endowed and ill-placed firm being "unable to compete" and, after a struggle more or less prolonged, going out of business. The ease and certainty with which this process of the "elimination of the unfit" accomplished itself in practice under the competitive system may easily be over-rated, but it certainly did occur. The risk of failure, of the total loss of all the capital sunk in the undertaking, was one of the accepted risks of industrial enterprise. Under combination other provisions are made for the flow of business from the less efficient to the more efficient units. In the case of trade associations working under a quota system, the less efficient members of the group are the more ready to let their business go to the more efficient in that they receive, from the pool, monetary compensation The least efficient may find it worth while to close down altogether and draw the compensation as long as the association continues, and the firms best equipped for efficient production may find it well worth their while to do more than their quota and pay the penalty.

This transference of work from the less to the more efficient firms does in fact take place to a considerable extent, and it cannot be doubted that as a result production is carried on to greater advantage, but it is not so clear that much of the advantage accrues to the general public, since the greater part of the gains of increased efficiency go in the form of compensation to the less competent producers Similarly with amalgamations It may be essential to the attainment of an effective monopoly that all the firms in a line of industry, inefficient and unprofitable, shall be brought within the amalgamation. But the inefficient concern will not sell out at a knock-down price; the fact that its non-existence is needed by the amalgamation gives it a new value. Many a trust and combine, therefore, has had to acquire properties already overdue for dissolution and has had to choose whether to keep them in being or close them down. It will be observed that in both types of combination the cost of providing for the elimination of the units that have shown themselves least fit in the industrial struggle falls not upon the owners of the derelict business but upon the more efficient survivors. Questions as to what shall happen in an industry to the least profitable concerns the capacity of which exceeds foreseeable demand are among the most difficult of all that confront attempts to "rationalize" such industries and proved to be the main obstacle to rationalization in the coal and cotton industries of Great Britain.

Limitations of Powers.—What are the limiting conditions within which combinations can wield their monopoly powers? It is clear that the distance to which a combination can go in the direction of extorting monopoly prices depends on the elasticity of the demand for the goods it handles, and in particular upon whether there is some other article, not very inferior, upon which the consumer can fall back in the event of prices being raised against him. In so far as its goods are sold to manufacturers in other industries, the undue exercise of monopoly power is likely to produce a corresponding degree of combination among its customers, resulting in prices being a matter of negotiation, bargaining, and agreement between parties of the same order of strength. Where the combination is of no more than national range, foreign

competition or the fear of such competition may act, in the absence of high import duties, as a check upon any tendency to abuse of monopoly power in some branches of manufacture, but the safeguard of foreign competition is apt to be rendered inoperative by international agreement or consolidation just when its influence is making itself most felt

It is evident that a combination representing an entire branch of industry, and charged with the best present and future interests of that industry, will not seek to raise prices to a level which will cause the volume of trade to shrink, the plant to be idle, and net earnings to fall. Another reason why it will be loath to run up prices is that the existence of unduly high prices furnishes a strong inducement for potential rivals to enter the field. Last, but by no means least, the maintenance of prices believed by the public to be materially above the competitive level is almost certain to bring about a demand either for governmental control or for the destruction of the combination.

Effect upon Prices.—One of the most important trade associations in Great Britain, the National Light Castings Association, declared in its original rules, "The object the Association has in view is that of raising and keeping up the price of the buyer . ." Most associations, however, would repudiate the suggestion that they aimed at raising prices, and would describe their policy as being directed towards "preventing price-cutting," "securing fair and reasonable prices," "providing a fair return on capital and energy," or, most probably, "stabilizing prices." Clearly, regularity of output, with continuity of returns, is a desirable condition for any industry, a condition much preferable to one of violent alternations of good times and bad Steadiness of prices has certain advantages for the consumer. Contractors and buyers of semi-manufactures and components find it satisfactory to be able to depend, in sending out estimates or in planning ahead their own developments, on a reasonable stability in the price they will have to pay for their wares. Again, in so far as the stabilization of prices is accompanied by the standardization of prices, *i.e.*, the charging of uniform prices or prices regulated in accordance with a known scale to all purchasers, there is some advantage in each contractor or retailer knowing that his rival is buying on the same terms as himself In a few industries, associations have done much to prevent prices falling, at times of slack demand, to ruinous levels, and there can be no doubt that, during the war-scarcity and post-war boom periods, the prices of goods controlled by associations were not in general allowed to rise to the heights reached by goods not so controlled While, as has just been pointed out, such price stabilization is, in some respects, socially beneficial, its net results are usually inimical both to the industry itself and to the nation at large The combination which maintains prices in the face of shrinking demand thereby insures a curtailment in the volume of its sales and production, and thus makes it inevitable that employees will be discharged. This policy of price maintenance, encouraged both by custom and monopoly, is then one of the prime causes of cyclical unemployment.

The effect of actual amalgamations of business concerns upon the trend of the prices of their products depends upon a multitude of factors—the circumstances of the businesses before the amalgamation, the thoroughness with which the economies of combination are carried out, and the extent of the monopoly power possessed by the amalgamation. At the beginning of the 20th century when the trust problem was much discussed, many students of the subject felt that it would not be long until all industries would be controlled by monopolies which would ruthlessly force up prices to exorbitant levels. Forty years later, it was found that industries were rare in which combinations had succeeded in establishing any effective control over prices. Just as some combination had seemed to gain virtual control of an industry, a virile rival had appeared to offer new competition When an association had forced up the price of one product, a lower-priced substitute had swept the market and nullified all the efforts of the monopolists. Only the public utilities, protected by exclusive franchises, had been able to exercise any considerable degree of monopoly controls, and they had been subjected to rigorous governmental regulation.

(J. H.; W. I. K.)

LEGAL POSITION OF MONOPOLISTIC COMBINATIONS

Great Britain.—The legal position of monopolistic combinations is determined (unless authorized by special statute) by their status at the common law. This status is decided, in general, by applying, in a given case, the common law doctrine of restraint of trade Contracts or agreements in restraint of trade are in principle unenforceable, though they are not actually illegal unless they involve an illegal act Nevertheless a contract which is technically in restraint of trade has long been regarded by the courts as valid and enforceable when it involves a particular restraint which is not larger than the protection of the party with whom the contract was made reasonably requires The doctrine of the unenforceability of contracts in constraint of trade is part of the larger legal doctrine of "public policy," which is interpreted in economic matters as equivalent to freedom of trade, or disapproval of measures in restraint of trade. In recent years however, the courts have shown a perception of the fact that free competition is not necessarily in the interests of the community, and that, on the contrary, competition may be accompanied or followed by serious disadvantages There has consequently been a tendency for the law relating to combinations to be stated with modifications Such modifications have become so general, in fact, that it is the exception, rather than the rule, that an alleged illegal combination will be held invalid as involving an unreasonable restraint of trade Numerous types of restraint practiced by combinations have been held, under common law, to be reasonable and not contrary to public policy. Included have been such characteristic agreements as those restricting competition, fixing prices, maintaining resale prices, establishing exclusive dealer arrangements, and granting deferred rebates. The post-World War difficulties of British industry and trade encouraged an increasingly tolerant attitude by the Government toward combines. This attitude has resulted in encouragement and even dictation of combinations in certain basic industries In some industries definite forms of combination have been legalized by specific legislation of Parliament In other instances encouragement has been given by means of administrative policies, but no specific pattern of combination has been established by statute. Agriculture and herring fishing are among those industries which belong to the former group; the iron and steel and chemical industries typify the latter

Canada.—Canadian policy has been embodied in a series of laws enacted since 1889 In that year, certain sections of the Criminal Code were drawn to cover instances of conspiracy in restraint of trade. These sections, amended in 1899 and 1900, provide penalties against those who combine or agree with others to limit unduly facilities for the production or distribution of, restrict unduly production or enhance the price of, restrict unduly competition in the production or distribution of, or restrain or injure trade in articles of trade or commerce. An amendment enacted in 1935 prohibits rebate or discount discriminations, by dealers, as between purchasers buying under similar conditions, and makes it an offence for dealers to engage in area price discrimination or to sell at unreasonably low prices in order to destroy competition The Criminal Code safeguards are supplemented by the Combines Investigation Act. This law, enacted in 1910 and frequently amended since, imposes heavy penalties upon every person or corporation "who is a party . to or knowingly assists in the formation or operation of a combine. . ." "Combine" is broadly defined to include any combination, obtained by merger, lease, agreement, or other method specified, which has operated or is likely to operate to the detriment of the public by limiting facilities for production or distribution; restraining production, fixing common prices or resale prices; enhancing prices; preventing or lessening competition; substantially controlling production or distribution; or otherwise restraining or injuring trade or commerce The Dominion Trade and Industry Commission administers the law and investigates unfair trade practices.

United States.—Under the common law of the United States as under English common law agreements in restraint of trade are not enforceable In 1890 there was passed the Sherman Anti-Trust Act which prohibited under severe penalties "every contract, combination in the form of trust or otherwise, or con-

spiracy, in restraint of trade or commerce among the several States, or with foreign nations" and declares it to be an offence to "monopolize, or attempt to monopolize, or combine or conspire, . . . to monopolize any part of the trade or commerce among the several States or with foreign nations." Much difficulty arose over the interpretation of the act, partly because of its abstract terminology and partly because of uncertainty as to whether it invalidated all, or merely unreasonable, restraints of trade. Successive Supreme Court decisions made the position increasingly clear, but in general in the direction of a more liberal interpretation of the statute. From the 1912 decision in the case of the United States Steel Corporation it appeared that the legality of a combination depended on the proportion of the industry it represented, and a 1911 decision made contracts not illegal unless in unreasonable restraint of trade. As a result of these decisions it was felt that the Sherman Act needed strengthening and, on the other hand, it had become evident that some power of dispensation was required to modify the cruder effects of the act. Consequently, in 1914, two further acts were passed, the Clayton Act, and the Federal Trade Commission Act. The Clayton Act legalizes certain activities of trade associations which were declared illegal under the Sherman Act. It makes it illegal for a company to acquire shares in another company if this leads to "a real diminution of the competition between companies" or "tends to establish a monopoly"; it prohibits price discrimination between different purchasers which aims at lessening competition or creating monopoly; and the giving of discounts or rebates on condition that the buyer shall not use or deal in the goods of competitors; and it contains provisions against the holding of posts simultaneously in different companies by directors and employees.

The Federal Trade Commission Act established a commission, to which was assigned two main tasks: to investigate and report on the organization and conduct of corporations charged with violations of the anti-trust laws and to prevent unfair competition. The commission was authorized, after a hearing, to issue orders against continuation of unfair competitive practices. It could appeal to a circuit court for enforcement of such an order.

Legislation since 1914 has authorized combinations in several industries, including shipping, export trade, marine insurance, railroad transportation, and agriculture. The Recovery Act of 1933, while in effect, exempted from anti-trust law any practices of industry groups authorized by "codes of fair competition." Also, the Sherman Act was amended in 1937 to permit contracts for maintaining resale prices of branded commodities. The price-discrimination clause of the Clayton Act, on the other hand, was strengthened in 1936.

British Attitude to Anti-Trust Laws.—As seen by British eyes legislation of the Sherman and Clayton kind is not easily made effective without the doing of more harm than good. The Committee on Trusts, appointed in Feb. 1918, turned its attention rather to what might be called "policing" action than to repression. It sought for ways in which combinations might be controlled or supervised to safeguard the public interest from the abuse of monopoly power while being left free to achieve all those economies and improvements which combination alone can furnish.

Public ownership, public control, public competition, profit limitation and profit taxation were passed under review. In all these schemes three main difficulties were encountered: first, that of defining a monopolistic concern; second, that of distinguishing rightful rewards of enterprise and efficiency from the exactions of monopoly; and, third, that of determining the datum on which rate of profit can be calculated. These suggestions were one by one rejected as limited in scope, difficult of application, or hazardous in reaction, and the committee turned its attention in other directions. It was thought that if fuller publicity in regard to the conduct and earnings of business concerns generally, and of the working and effects of combinations in particular, could be secured, the desired object would be in great measure achieved. It was also thought that some machinery should be provided whereby suspected or alleged abuses could be penalized.

Accordingly, the conclusion was reached that there should be established a department of state charged with the duty of informing itself as to the nature, extent and development of combinations of all kinds in so far as they tend to the restraint of trade and the creation of monopolies, and of making preliminary inquiry into complaints made in regard to them, also that a tribunal should be set up to which the department could apply for powers to obtain particular information, and would refer for full investigation cases in which combinations appeared to act injuriously to the public interest. The requisite publicity would thereby be secured in two ways: the relevant facts as to offences proved before the tribunal would be made public, and the department would present annually to parliament a report upon the nature, extent and development of combinations. Publicity thus secured would not only be in itself a considerable safeguard against the abuse of monopolistic power, but it would serve to reveal actions and developments for which publicity alone was not a sufficient safeguard, and against which further action should be taken, whether in the form of nationalization, public competition or the control of prices and profits. These conclusions formed in substance the recommendations of the committee, but such recommendations did not result in legislation of the suggested type.

The fact that the recommendations of the Committee on Trusts have not been adopted in British legislation is not surprising, considering the fundamental change in the attitude of the people since the World War—and especially during the second decade after the war—toward trade and industrial combinations. The former emphasis upon competition between individual units of business has been supplanted to an important degree by an attitude of approval of concerted or co-operative action by means of combination. This attitude toward business combination has been evident among British statesmen as well as business leaders.

This basic shift in the British attitude toward "trusts"—paralleled by a similar change in many other countries—had its roots in the economic conditions growing out of the World War. Readjustment of industry and trade to peace-time conditions was rendered difficult by deflation of prices, excessive plant capacity, heavy taxation and mounting restrictions on international trade. The position of British industries was especially difficult because her economy relied so heavily upon foreign trade and markets, both of which were greatly affected by the post-war policies aimed at the achievement of national self-sufficiency.

A committee of the Government—the Committee on Industry and Trade—made an intensive study of the British economic position from 1925 to 1929 and submitted a final report in the latter year. Statements of this committee indicate clearly the basis for the development of sentiment for co-ordination and combination in business. The committee was of the opinion "that the first step towards putting British industries in a position to compete successfully in overseas markets is to subject their organization and equipment to a thorough process of reconditioning." In a supplementary statement to the final report, a number of the members of the committee stated that the last quarter of a century had witnessed "a mighty transformation from individualistic to co-operative methods of action" and that "it is in proportion as the principle of co-operative action and control is accepted that we find economic success achieved, both at home and abroad."

Pursuant to this type of thought, the Government has encouraged informal combination arrangements established by industry groups and, by such acts as the Cotton Industry Reorganization Act, the Sugar Industry Reorganization Act, the Livestock Industry Act, and others of similar character, has provided for definite forms of combination.

TRUTH. The concept of truth belongs to the fundamental philosophical problems—in fact, one may describe it as the central question of all theoretical philosophy. The first step in philosophic reflection consists in asking the question concerning the nature and criteria of truth. The world of being is no longer accepted as a simple datum, but a "reason" for it is required; a "principle" is sought which will enable human cognition to distinguish "genuine" being from "non-genuine" being, "reality" from "appearance," truth from error. The same change of attitude occurs also in regard to *values*. Here, too, cognition is not satisfied with the values accepted on the testimony of tradition, custom or authority, but inquires into the *meaning* of the difference between "good" and "evil," and seeks universally valid, "objective" norms to justify this distinction. In this two-fold significance, the problem of truth was first raised in Greek philosophy. From it evolved the various fields of philosophy within Greek thought. Logic as also ethics and physics have their common root in the problem of truth. For they are all founded on the presupposition that both the *immediate* view of reality, as presented to us in perception, and the immediate purposes pursued by instinctive impulse and desire, are not finally valid. This immediacy is transcended in the theoretical as well as in the practical sense: it is "questioned" and "called to account." This account implies that from now on, in the sphere of thinking, as in that of willing, individual contents are distinguished as having positive or negative value, the latter being rejected as "invalid," the former retained as "valid." This fundamental distinction forms the pervading theme of Greek philosophy.

The individual systems differ only in the means by which they try to solve it, by which they try to obtain a clear definition of the difference between "True" and "False."

In theoretical respects, the first step is made when the certainty of immediate sense perception is shaken and is opposed by another, "critical" authority. It is not the senses which decide about truth and falsehood, about being and non-being; the decision rests with reason, pure thought. The beginnings of this view can be traced to the older Ionian philosophy of nature, but it reached its proper development only in the classical systems of the great pre-Socratics. Parmenides and Heraclitus, Pythagoreanism and Atomism reject unanimously the view of the world as perceived through the senses and oppose to it another view which is based on thought—the power of the "Logos." According to Heraclitus, the senses alone are "bad witnesses": they can be used for a knowledge of reality only when they are judged by the soul as to their value and truth. The senses individualize and separate; as long as we follow them exclusively, each perceiving mind has its own world in which it remains enclosed. Thought, however, is "common to all": by means of it, alone, we reach a universally valid, "objective" view of the cosmos. "It is a duty to follow that which is common; but although the Logos is common to all, the majority live as though they had an insight of their own" (Heraclitus, *Fragment* 2 [Diels]; cf. *Fragments* 72, 89, 113–114). "Wisdom resides in One, in the recognition of the reason which pervades all and everything" (*fr.* 41). According to Parmenides, the road to truth consists in not allowing oneself to be misled by well-worn habit into trusting sense perception: "no, by reason decide the controversial test, the question of Being and Non-Being" (Parmenides, *Fragment* 1, *cf.* 35 *sqq.*). The true power of conviction (πίστις ἀληθής) does not reside in the senses but in pure thought: "for thinking and being are the same." Similarly, the Pythagoreans see the true *essence* of reality in number, because number is to them the principle of all truth. "For nothing of delusion (ψεῦδος) does the nature of number admit; but delusion occurs only in the realm of the unlimited, the unreasonable, and of that which is not determined by the Logos" (Philolaos, *Fragment* 11). Democritus distinguishes two forms of cognition: the genuine and the spurious one. The spurious one comprises sight, hearing, taste, smell and touch—in short, the whole world of sense qualities, which exist only "according to custom";—the genuine one gives us an insight into the veritable, the "true" reality, which belongs only to the atoms and empty space (Democritus, *Fragment* 11).

The completion of this trend of thought is reached in Plato. According to the platonic doctrine of ideas the sensible world, as a world of becoming, can possess no veritable being or truth. It is a world of mere "opinion" (δόξα), a world of "appearance," whereas truth and knowledge refer only to objects of pure thought which are not subject to change. This "rational" conception of truth, however, was not without its countercurrents in Greek philosophy. The *Sophists* deny the possibility of a universal truth valid for all thinking subjects. According to the proposition of Protagoras that "man is the measure of all things," truth is relative and subjective: "for each, his perception is true" (*cf.* Plato's *Theaetus*). Out of this opposition, there develops in later Greek philosophy the controversy between the "dogmatic" and the "sceptical" schools. For the former, there is a universally valid "criterion" of truth, which gives to certain concepts and principles absolute certainty.

According to the *Stoics* this criterion consists in "cataleptic presentation" (φαντασία καταληπτική). It forms a spontaneous achievement of thought, a type of assent (συγκατάθεσις), which must be added to the sensible impression in order to make it *known*. A doubt with reference to the "cataleptic presentation" is not possible: we possess full evidence that the object is reproduced in it as it is in itself. In opposition to this the Greek Sceptics deny that there is any such criterion of "evidence." All supposed "truth" is mere probability. For the absolute objects, the "things in themselves," are entirely unknown to us (ἄδηλα); accessible to our judgment are merely the appearances of things, which, however, take entirely different shapes according to the differences of the perceiving subjects and the conditions of the perception itself. The definiteness of reason, of the "Logos," is thus abandoned: concerning any subject there are innumerable assertions each of which may claim to be equally valid. (*See* Herbertz, *Das Wahrheitsproblem in der griechischen Philosophie*, 1913.)

Mediaeval scholasticism, in its definition of the concept of truth, refers throughout to Greek philosophy, especially to Aristotle. According to it, truth consists essentially in the agreement of thinking and being, in the *adaequatio intellectus et rei* (Thomas Aquinas, *De veritate* 1, 2). But this definition bears now a new content. For the problem of truth belongs no longer exclusively to the realm of logic, to the sphere of pure *cognition*, but refers essentially to the question of *religious certainty*. The opposition between "sensibility" and "thought" is now replaced by the opposition between "faith" and "knowledge." Religious faith seeks support in the intellect (*fides quarens intellectum*), although it cannot find in it a sufficient foundation but stands in need of another, superior source of certainty. Thus the problem arises as to how both principles of certainty, how "natural intellect" and "revelation" stand to one another. Scholasticism, at times, supposes a relation of mere *subordination;* at times, it asserts a complete separation between them. In the later nominalism this idea of separation is predominant. There arises the doctrine of "twofold truth," according to which a definite sentence may be true from the standpoint of knowledge and false from the standpoint of faith. The problem of truth and of logical and religious certainty

had been conceived most profoundly by Augustine. "Do not turn outward; go back into yourself; in the inner life of man resides the truth." The inner life gives us, as a first indubitable starting point, the certainty of the thinking, feeling and willing subject: the certainty of our own Being and Knowing and Willing. This certainty cannot be attacked by doubt because doubt itself is an act of thought and must, therefore, presuppose the latter. "Whoever knows himself as doubting, knows something true and is certain of that which he knows; he is thus certain of truth. Therefore, whoever doubts whether there is a truth, has thus in himself a truth about which no doubt is possible. Therefore, he who doubts at all, cannot doubt truth as sucn." (Augustinus, *De vera religione*, cap. 39.) However, this *immanent* truth as exhibited in the thinking consciousness, is not the only one, nor a sufficient one for the foundation of religious cognition. For the Being to which religious cognition refers, lies, as an *infinite* Being, beyond the limits of human consciousness. For a knowledge of the Divine mere *ratio* must be "transcended" by another power of the mind. Entering into the inner life of the subject and going beyond this inner life are thus the two phases which disclose the realm of truth as a whole. If there were only a truth of finite and contingent things, we could stop with the finite, empirical consciousness as the bearer of this truth. However, since there is a region of eternal truths (*veritates aeternae*)—Augustine cites the truths of religion and of pure mathematics—there must be an infinite intellect which thinks them and in which they subsist. Human thought does not create these truths; it is only able to receive them in so far as it is enlightened by a higher power. In every cognition of a necessary and eternal truth, our reason is only seemingly self-active and autonomous. In order to apprehend such a truth, it must be enlightened by the divine intellect. The divine Logos is the "hidden sun" which alone makes truth visible for us.

The intimate connection of the problem of truth with the problem of God, which is characteristic of mediaeval epistemology, continues for a long time also in *modern philosophy*. The after-effects of the Augustinian doctrine are obvious in Nicolaus Cusanus and Marsilius Ficinus. (*See* FICINO, MARSILIO.) (*Cf.* Ernst Cassirer, *Individuum und Kosmos in der Philosophie der Renaissance*, 1927.) But also Descartes and Malebranche, Cudworth and the Cambridge Platonists show clearly traces of this. On the other hand, however, there develops a more and more pronounced tendency to emancipate the problem of truth from all entanglements with theological questions and to give it logical independence. Modern rationalism, as represented especially by Herbert of Cherbury's *De veritate* (1624), maintains the pure self-determination, the unconditioned autonomy of thought. Human reason decides according to its own, universally valid, innate principles about truth and error. Its fundamental concepts and axioms are absolutely binding. There can be no conflict between faith and knowledge because any truth of faith needs the test of reason to attain to and be determined in its certainty. In Descartes, Spinoza and Leibniz, the clear and distinct cognition (*clara et distincta perceptio*) is set forth as the criterion of truth. Those judgments alone may claim universal assent which are founded on clear and distinct ideas and which allow us to recognize the connection of these ideas with the same certainty that obtains in the propositions of mathematics. (*See* RATIONALISM.)

Accordingly, the characteristic trait of truth, the *norma veritatis*, is no longer placed in the agreement of a presentation or cognition in us with an external "transcendent" object, but in the agreement with definite principles of reason itself. Every idea is called true which can be derived from them in a strictly deductive manner, by the method of purely logical or mathematical inference. When this proof has been given for a certain idea, there can be no doubt that the objective reality must conform with the idea; for this agreement forms, itself, a necessary axiom of reason. Thus, Spinoza, for instance, expounds in his *Treatise on the improvement of the understanding* that that which makes a thought a true thought, must lie entirely within it; that the real cause of truth is to be sought, therefore, not in an external object, but exclusively in the intellect itself. The mathematical idea of the sphere, for instance, is "true" even if there is no entity to be found in intuition and empirical perception which corresponds to the definition of the sphere in all respects and with perfect accuracy; and after this ideal conception of the sphere, we determine the reality of "nature" as it is grasped and "clearly and distinctly" recognized through geometry and mechanics. With particular clarity this conception of truth appears in Leibniz's *Meditationes de cognitione, veritate et ideis* (1684). Against the nominalistic view of Hobbes, that truth consists only in the correct connection of certain linguistic signs (*veritas non in re, sed in dicto consistit*), Leibniz emphasises that the correctness of the connection between the signs must be based on a relation between the ideas themselves. Truth, therefore, always depends on the relations which subsist between the pure ideas.

The process in which the assumption of one idea necessarily implies another, gives birth to the systematic coherence of knowledge—and this *nexus* according to the principle of sufficient reason makes up the fundamental character of all truth. Even the truth of phenomena consists only in the fact that they obey certain laws which correspond to the ideal truths of pure logic and pure mathematics. A different form is given to the problem of truth in the English philosophy of the 17th and 18th centuries. In Locke the "intuitive" truth of mathematical ideas is contrasted with the empirical certainty of the existence of things, which can never be inferred by pure logic, but rests on the testimony of sense perception. Empirical truth, in this sense, belongs only to the simple ideas which are given to us immediately through sensation or reflection. What we can predicate, on the other hand, about the connection of these simple ideas, about their coexistence, their regular recurrence, etc., has no truth in the strict sense of the word, no demonstrative certainty, but rests on mere probability. With Berkeley and Hume, this view is developed further and stated more radically with reference to the empirical knowledge of nature. The order of nature is not founded on principles which can be understood in themselves as necessary and unconditionally valid, but it represents a purely empirical regularity with which we become acquainted through *habit* and *custom;* the knowledge of this order can, therefore, never claim to be more than probable.

With Kant, the battle between the rationalistic and the empirical conceptions of truth is decided in such a way that the laws of pure understanding are recognized as necessary and universal, as valid *a priori*, but that, on the other hand, these laws themselves can retain their validity only within the bounds of experience. The traditional definition of truth—namely, that it is the "agreement of knowledge with its object"—involves, as Kant expounds in the *Critique of Pure Reason* (p. 82), a logical circle. For the problem of knowledge consists in determining just what the "relation of a presentation to its object" means, and how we can ascertain this relation. The concept of an "object of knowledge" is only the concept of a "Something in general=X," "because, apart from our knowledge, we have nothing which we could set over against it as corresponding to it." "It is clear, however, that because we have only to do with the manifold of our presentations and because that X which corresponds to them, in so far as it is to be something distinct from our presentations, is for us nothing, the unity made necessary by the object can be nothing other than the formal unity of consciousness in the synthesis of the manifold of presentations. Then we say: we know the object, when we have effected synthetical unity in the manifold of intuition." (*Kritik der reinen Vernunft*, 1st ed., p. 104 *seq.*) The "transcendental" truth, the truth of the object, rests thus on the "formal" truth; for only the forms of pure intuition and understanding make a connection of the phenomena possible; this connection, however, and nothing else, is meant when we attribute to a phenomenon objective significance, objective validity. However, since, on the other hand, the concepts of the synthesis *a priori*, although not originating in experience, all refer, nevertheless, to experience as the condition of its possibility, one may say that the possibility of experience is that which alone gives objective reality to all our cognitions. Cognition *a priori* has, therefore, *truth* (agreement with the object) only because it contains nothing further than what is necessary for the synthetic unity

of experience. (*Kritik der reinen Vernunft*, and ed. p 195 ff.) In this sense, Kant declares that with regard to theoretical cognition of nature, experience supplies the rule, and that it is the "source of truth" (*Krit. d. r. Vern.* p. 375); but in contradistinction to the empiricism of Locke and Hume, experience is here to be understood not as a "mere rhapsody of perceptions," but a synthetical unity according to laws. In this point, Kant sees the decisive contrast between his "formal" idealism and the speculative idealism represented, for instance, by Berkeley. "The thesis of all true idealists, from the Eleatic school down to Bishop Berkeley, is contained in this formula: 'All cognition through sense and experience is sheer illusion, and only in the ideas of pure understanding and reason is truth.' The principle which governs and determines my idealism throughout, is, on the contrary: 'All cognition of things merely out of pure understanding or pure reason, is sheer illusion, and only in experience is truth' " (*Prolegomena*, Appendix).

Also in the epistemology of the 19th and the beginning of the 20th century, the problem of truth is the central problem It is especially the battle between pure "formalism" or "logicism" on the one hand, and "pragmatism" on the other, which gives to this epistemology its stamp. In the sense of "logicism," the concept of truth is determined especially by Bernhard Bolzano (1781–1848). Bolzano demands that the logical definition of truth must be set forth without any regard for the individual minds for whom the truth is valid, and without any intermingling of psychological determinations. Truth is entirely independent of the thought of an individual mind. This view is expressed in Bolzano's concept of a "truth in itself." "I understand by a truth in itself any proposition which predicates something as it is, whereby I leave undetermined whether this proposition has really been thought and expressed by anybody or not. Be it the one or the other, the proposition shall always receive from me the name of a truth in itself if only . . . the object with which it deals, really possesses what it attributes to it. Thus, the quantity of flowers, for instance, which a certain tree standing in a definite place had last spring, is an indicable number even if nobody knows it; a proposition, therefore, which indicates this number, has for me the name of an objective truth even if nobody is cognizant of it."

This formal determination of truth, which abstracts from any reference to actual thinking, is opposed by pragmatism (*q v*). For pragmatism, the concept of truth can be understood only if it is referred to the *activity* of thought, and if this activity is not considered merely in the abstract but is treated as a vital expression of a living individual. "True" is the term applied to those representations which hold good in the course of one's experience, *i.e.*, which prove practically useful. This "power to work" is the real characteristic and criterion of truth. It is, accordingly, not so much an abstract-logical, but rather a *biological* conception: the truth of a judgment is decided not by the agreement with a reality existing in itself, but by its practical efficiency. As a consequence, there results that *relativity* of truth which had already been urged by the Greek Sophists, especially by Protagoras. Truth is never absolute and universally valid: it is always true only for a definite biological species, inasmuch as the advantage of certain beliefs depends upon what is conducive to the species. (For a *criticism* of pragmatism, *see* Cassirer, *Substance and Function*.) In an entirely different manner and with a different tendency Rickert tries to base the conception of truth not so much upon theoretical as upon "practical reason." According to Rickert's doctrine, we must start our quest for this concept not from the idea of what *is*, but from the idea of what *ought to be*, not from "ontology," but from the *theory of values*. The concept of reality finally presents itself as a concept of values; for we apply the name "real" to that which, in demanding recognition from every thinking mind, is valid as a *norm* for all thought. Only by regression to a superindividual command, to a "transcendent ought," can the meaning of truth be clarified and understood. All cognition, inasmuch as it proceeds by judgments, *i.e.*, by assent and dissent, implies an act of taking sides. Such an attitude, however, is possible only towards a value. Insight into this "primacy of the ought" is necessary for a satisfactory solution of the problem of truth. (Rickert, *Der Gegenstand der Erkenntnis*, 1904.) In general, the treatment of the problem of truth in the epistemology of the 19th and 20th centuries, as compared with that of the 18th century, shows a change in point of view. The opposition of "experience" and "thought," of "empiricism" and "rationalism," has been replaced by the opposition of the "theoretical" and the "practical," "intellectualism" and "voluntarism."

(E. Ck.)

TRUTNOV or TRAUTENAU, a town of Bohemia, is situated at the foot of the Riesengebirge, on the Upa. Founded by German colonists in the 13th century, it developed a flourishing linen industry which was helped by the bleaching suitabilities of the mountain streams. Pop. (1930) 15,923, mostly Germans. The town was ceded to Germany in 1938 by the Pact of Munich.

TRUXTUN, THOMAS (1755–1822), U.S. naval officer, was born at Jamaica, Long Island, N.Y., Feb 17, 1755, and, at the age of 12, went to sea in the London trade. During the Falkland Island war scare (1770–71), he was impressed for a short space in the British navy. At the outbreak of the American Revolution he was engaged in importing powder, but turned early to privateering From 1777 to the close of the war, he commanded letters-of-marque bringing supplies from France and the West Indies, and won a number of hard-fought engagements with enemy vessels. He engaged in the China trade during the peace years, and was appointed a captain in the new U.S. navy by President Washington in 1794. He superintended the building of the frigate "Constellation" at Baltimore, and commanded her during most of the quasi-war with France. Truxtun won naval renown, on Feb. 19, 1799, when he took the French frigate "Insurgente" in a spectacular fight off Antigua, and added to his reputation a year later when he defeated the French frigate "Vengeance," and drove her into Curaçao His resignation from the command of a fleet, planned to combat the Barbary pirates in 1802, was interpreted by the secretary of the navy as a resignation from the navy itself. Highly incensed and cherishing the supposed slight, Truxtun refused overtures from the navy department during the War of 1812. He engaged successfully in Pennsylvania politics until his death in Philadelphia on May 5, 1822.

See *Quasi-War with France*, and *Barbary Wars* (1935–1942); John Frost, *The Pictorial History of the American Navy* (1854).

(W. B. Ck)

TRYON, DWIGHT WILLIAM (1849–1925), U.S. artist, was born at Hartford, Conn , Aug. 13, 1849. At the age of 25 he left his position as a clerk in a Hartford publishing house to devote himself entirely to art, and two years afterwards went to Paris, where he became a pupil of the École des Beaux Arts, under J. de la Chevreuse, Charles Daubigny and A. Guillemet. He first exhibited at the Salon in 1881. In 1882–86 he was director of the Hartford School of Art, and in 1886 became professor of art at Smith college. He became a National Academician (1891), and won numerous medals and prizes at important exhibitions, among his pictures being "Daybreak," "Moonlight" and "Early Spring, New England." He died at South Dartmouth, Mass., July 1, 1925.

TRYON, SIR GEORGE (1832–1893), British admiral, a younger son of Thomas Tryon, of Bulwick Park, Northamptonshire, was born on Jan. 4, 1832. He entered the navy in 1848, and served on various stations and in the Abyssinian expedition of 1867. In 1889 Tryon was promoted vice-admiral; and in August 1891 was appointed to command the Mediterranean fleet, which under him—following the example of his old chief, Sir Geoffrey Hornby—became an evolutionary and, in that sense, experimental squadron. On June 22, 1893, the fleet being off Tripoli on the coast of Syria, in two columns, Tryon made the signal to invert the course, the ships turning inwards in succession. By a fatal error, the psychological cause of which has never been explained, he ignored the patent fact that the two columns were so near each other that the manoeuvre, as ordered, must entail the most serious risk, if not certainty, of collision. And, in fact, the two leading ships did come into collision, with the result that the "Victoria," Tryon's flagship, was cut open and sank in a few minutes. Tryon and 358 officers and men were drowned.

TRYON, WILLIAM (1720–1788), American colonial governor, was born at Norbury Park, Surrey, England, in 1729. In 1764 he succeeded Arthur Dobbs as governor of North Caro-

lina. By refusing to allow meetings of the Colonial Assembly he prevented North Carolina from sending representatives to the Stamp Act Congress in 1765. With the support of the law-abiding element he suppressed with severity the Regulator uprising of 1768–71, caused partly by excessive taxation. In July, 1771, he was transferred to New York, where he acted as governor, nominally at least, until 1780 On his return from a trip to England in 1775 he found the colony in rebellion and was compelled to take refuge on the sloop-of-war "Halifax" in New York harbour. He was restored to power when the British took possession of New York city in September, 1776, though his actual authority did not extend beyond the British lines. In 1777 he became commander of a corps of Loyalists, and in 1779 invaded Connecticut and burned Danbury, Fairfield, and Norwalk. In 1780 he returned to England, and on Jan 27, 1788 died at his London home.

See M. D. Haywood, *Governor William Tryon and his Administration in the Province of North Carolina* (1903).

TRYPANOSOMES, single-celled parasitic animals belonging to the class *flagellata*, chiefly found in the blood of vertebrates; some cause dangerous maladies, *e g*, sleeping sickness in man, and nagana, or tsetse disease in ruminants, in Africa. For further particulars *see* PROTOZOA.

TSAI-DAM (ZAIDAM), a basin area in Central Asia, between the eastern Kuenlun mountains on the south and the Altyntagh and Nan-shan mountains on the north, in the north part of the Chinese province of Kuku-Nor. Its altitude is about 8,200 ft. above sea, and it has many brackish pools and swamps with bare hills around them, there being little vegetation, save on the mountain slopes around. The name Tsai-dam is widely applied to dry lake bottoms in the Mongolian region

TSANA, lake, Africa: *see* TANA.

TSANKOFF, ALEXANDRE (1879–), Bulgarian statesman, was born in 1879 in the town of Oriatovo, on the Danube. He got his secondary education at Roussé and studied law at Sofia university. After specializing in political economy in Germany where he was sent by the university he became professor of economics at Sofia university. A social-democrat in his student years, Tsankoff long remained outside active politics In 1922 he became leader of a small group called the National Concord (Naroden Sgovor), drawn from the intelligentzia of the various political parties and the mass of ex-officers, which aimed at combining the dispersed national forces for a struggle against the semi-dictatorship of Stamboliski. To him fell the premiership of the coalition Government, representing all the political parties, except the communists, that took power on June 9th, 1923, after a military *coup d'état*, in the preparation of which Tsankoff's National Concord had its share. Prof Tsankoff remained prime minister till the end of 1925 when he was replaced by Andrea Liaptcheff (*q v*) another leader of the Democratic Union. His tenure of office coincided with one of the most tragic periods in modern Bulgaria's history. The disturbance that broke out after the overthrow of Stamboliski's régime took thousands of human lives. The principal moments in it are the communist rising of Sept. 1923 and the communist outrage at Sveta Nedelia in April 1925 Tsankoff was minister of public instruction, 1930–31.

TSCHAIKOVSKY, NIKOLAI VASSILIEVICH (1850–1926), Russian revolutionary and politician, born at Viatka, studied chemistry at the university of St Petersburg under Mendelyeev and Butlerov, and published in the *Bulletin of the Academy of Sciences*, an original work on chemistry. But pure science did not satisfy the ardent youth, who strove for practical activity. Herbert Spencer and Auguste Comte were Tschaikovsky's spiritual guides. The 19 year old student became the soul of the "circle," which soon took his name. "The circle of Tschaikovsky" laid the foundation of the Russian Narodniki (populist) movement and for many years directed its channels. Persecutions by the authorities changed the character of the movement; from purely cultural it became political, and from the original circle it soon created the revolutionary-terroristic "Narodovolzy."

Tschaikovsky fought desperately against the new tendencies, and after a strong moral crisis left Russia with a few followers for America, where he founded in the wild steppes of Kansas a colony of people "seeking God in themselves." He organized this commune of "Godmen" in the belief that only people enlightened from within could conquer social evils and form a perfect society. Nikolai Vassilievich remained true to this conviction and his Christian faith to the end of his days. The Kansas experiment did not succeed and after two years Tschaikovsky returned to Europe "to fight for his ideals among men."

He could not return to his country; long years of exile began. He worked in the "Red Cross of the Narodnaya Volia," in the "Fund of the Free Russian Press" and went to the United States to collect funds and to make propaganda for the Russian movement for freedom. In 1900 during a secret voyage to Russia he was arrested, but set free after trial. He devoted himself to the organisation of the co-operative movement in Russia. The war and revolution found the "first Russian Narodnik" at work in relieving the sufferings of the Russian people: he helped with the food supply of the Northern front, and fed the populations of Lettonia, Poland and Latvia ruined by the war In the revolution of 1917 he fought to the last the Bolshevist currents in the councils of workers and soldiers deputies, finally resigned and gave himself entirely to the White fight against the Bolshevist government. He was elected a member of an All-Russian directory in Ufa, and later became president of the Northern Government on the Archangel front. Afterwards he was a member of the "political consultation" in Paris, and of the South-Russia government in Ekaterinodar and the Crimea. Exile again, once more emigration. The White front was broken, the White fight lost. After the fall of the Crimean front Tschaikovsky organised in Paris a secret "centre of action," for a fight against the Bolsheviks inside Russia. Until 1923 efforts were made to organise in Russia "a new revolution" but for lack of funds the "centre of action" ceased its existence

TSCHAIKOVSKY, PETER ILICH (1840–1893), Russian composer, born at Votkinsk, in the province of Viatka, on May 7, 1840, was the son of a mining engineer, who shortly after the boy's birth removed to St. Petersburg (Leningrad) to become director of the Technological institute there. While studying in the school of jurisprudence, and later, while holding office in the ministry of justice, Tschaikovsky picked up a smattering of musical knowledge, but he was never suspected at first of possessing any special musical talent, of which there had been no previous traces in his family. Nevertheless, the seriousness of his musical aspirations revealed itself in due course and led him to enter the newly founded Conservatorium of St. Petersburg under Zaremba, where he was induced by Anton Rubinstein, its principal, to take up music as a profession.

With the former he fared better than the latter who, though worshipped by Tschaikovsky, seems never to have appreciated the gifts and promise of his young pupil who was destined none the less completely to eclipse his own fame. Very different was the attitude of Nicholas Rubinstein (Anton's brother) who showed his belief in the young musician in the most practical manner by inviting him to become, in 1866, practically the first chief of the recently founded Moscow Conservatorium, since Serov, whom he succeeded, never took up his appointment.

In Moscow, while engaged at the Conservatorium, Tschaikovsky wrote among other things his first opera *The Vojevode*, which was, however, a failure when produced in 1869. In the meantime he had met in St. Petersburg Balakirev, Stassov, Rimsky-Korsakov and other representatives of the then "advanced" school in Russian music, who exercised a stimulating influence on him, although neither then nor later was he ever wholly in sympathy with their ideals.

Also at this period he fell desperately in love for a time with the opera singer Désirée Artôt who, however, shattered his hopes by marrying someone else He found consolation in his art, and his third opera *The Opritchnik*, was one of many works composed at this time, others including the pianoforte concerto in B flat

minor, the third symphony and another opera *Vakoula the Smith*. The *Oprischnik* was produced at St. Petersburg in 1874 and *Vakoula the Smith* in 1876, but neither had any success.

A happier fate attended the B flat minor piano concerto, which though severely condemned in the first instance by Nicholas Rubinstein (to whom it was originally dedicated) as clumsy and unplayable, as a mere duel between the piano and orchestra, and so on, was afterwards taken up with enthusiasm by Hans von Bülow (to whom the composer transferred the dedication) and performed by him everywhere with the greatest success. At the same time it is only fair to add that Tschaikovsky, though much hurt by Nicholas Rubinstein's strictures, considerably modified the work on the strength of his criticisms and that Rubinstein in turn ultimately recognized the merits of the concerto and played it constantly. To the period of the late '70s belong the E flat quartet, the ballet *The Swan Lake*, and the "Francesca da Rimini" fantasia among other compositions, while during this period also, namely in 1877, Tschaikovsky first began to work on the opera of *Eugen Onegin*, destined to become the most popular of all his stage works and first heard at the Moscow Conservatorium in March 1879.

Meanwhile the more personal side of the composer's career had been given a romantic touch by his acquaintance with his life-long benefactress Nadezhda Filaretovna von Meck (1831–1894) and his deplorable fiasco of a marriage. In 1876 he had aroused the interest of Mme. von Meck, the widow of a wealthy railway engineer and contractor. She had a large fortune and she began by helping the composer financially in the shape of commissions for work, but in 1877 this took the more substantial shape of an annual allowance of £600. The strangest feature of their association consisted in the fact that, by agreement, they never met, though they corresponded with one another continually. In 1890 Mme. von Meck, imagining herself—apparently a pure delusion—to be ruined, discontinued the allowance; and though Tschaikovsky was then no longer really in need of it, he was deeply wounded by the manner in which she had made the announcement, and to the end of his days never entirely recovered from the shock which his abnormally sensitive nature had received from the termination of their relations.

Not less distressing was the episode of his marriage. Tschaikovsky married Antonina Ivanovna Milyukova on July 6, 1877, but the union proved an impossible one through no fault of hers but simply through his own abnormality of temperament; and it resulted in separation in October.

Tschaikovsky, who was deeply affected, went abroad with his brother to recover and was restored in due course to a more satisfactory state, but such happiness as he was to enjoy throughout the remainder of his career was qualified in an ever increasing degree by the tendency to melancholy and morbid introspection which, from the first, had been a conspicuous characteristic of his disposition.

Nor can it be said that he did not have many causes for discomfort and disillusionment in the ill luck and indifferent appreciation which attended in so many instances the performances of his works. But he continued to produce none the less with unchecked ardour and the fourth symphony may be named among the other works which he composed during his period of recuperation abroad.

Later, after his return to Russia, came the Italian Capriccio and the "1812" overture among other things. In 1879 he wrote his *Maid of Orleans* (produced in 1880) and his first suite for orchestra. In 1881 died Nicholas Rubinstein, to whose memory he dedicated the pianoforte trio in A minor. To the next five years belong the *Manfred* symphonic poem and the *Hamlet* overture fantasia, the operas *Maseppa* and *Charodaïka*, the "Mozartiana" suite and the big fifth symphony, of which even the last-named, though reckoned nowadays among his finest achievements, failed to elicit any great enthusiasm at first. Nor were the opera *The Queen of Spades* (which later vied with *Eugen Onegin* in popularity) or the delightful ballet *The Lake of Swans, The Sleeping Beauty* and *Casse-noisette* any more favourably received when first produced, so far at least as the critics were concerned. Better fortune, however, attended the *Casse-noisette* music in suite form which soon found unlimited favour and quickly established itself as one of the most popular pieces of its class ever written. (Incidentally, it may be noted that Tschaikovsky himself had the poorest opinion of this music when he was actually writing it.)

But though, after the time honoured experience of genius, Tschaikovsky gained full appreciation so tardily in his own country, in foreign countries his claims were much more readily recognized. In 1887 the first of several concert tours took him to Leipzig, Berlin, Prague, Hamburg, Paris and London, and won many warm friends for his music in every instance, not least so in London where he conducted the Serenade for strings and the Variations from the third suite at a Philharmonic concert.

Later, in 1891, he paid a visit to America, where he conducted six concerts—four in New York, one in Baltimore and one in Philadelphia—and again he was everywhere received with unbounded enthusiasm, the works performed being the Coronation March, the third suite, two sacred choruses, the B flat minor piano concerto and the Serenade for strings.

In 1893 Tschaikovsky sketched his sixth symphony, becoming more and more absorbed in his task as the work proceeded and more and more firmly convinced that it was the greatest thing he had ever done, a judgment subsequently confirmed in full measure by the world at large; for this was the symphony afterwards known as the "Pathetic," and under that title destined to enjoy such world-wide fame and popularity as perhaps no similar work had ever known before. Yet even this symphony had a cold and indifferent reception on the occasion of its actual first performance (on Oct. 28, 1893) at St. Petersburg, though in this instance the verdict was speedily reversed, both in Russia and elsewhere.

But the composer was not fated to witness and enjoy its triumphs. For within ten days of its production the world was shocked by the news of his wholly unexpected death—from an attack of cholera, caused by the drinking of unfiltered water—on Nov. 6, 1893.

As to the precise value of Tschaikovsky's music and the place which it is likely ultimately to take critical opinion has been sharply divided, but with a prevailing tendency to accord far less importance to his work than some consider its due. Almost inevitably the enormous popularity enjoyed by so many of his works at the hands of the general public has strengthened this tendency and the impartial student may well wonder if, even when the worst has been allowed, the process of critical belittlement which has been witnessed during recent years in the case of Tschaikovsky, has not gone far beyond the requirements of the case.

While his work as a whole may be unequal, there is in the finest of his orchestral compositions, which represent him at his best, a breadth and scope, a wealth of inspiration and imagination, and a command of his materials which may well secure for them a far greater measure of favour at the hands of posterity than is anticipated by some of his critics. How, indeed, the title of a great master can be denied to the composer of such things as the fifth and sixth symphonies, the "Francesca da Rimini" fantasia, the B flat minor piano concerto, and the pianoforte trio, it is indeed hard to understand. Tschaikovsky's operas are admittedly on a lower plane than the best of his orchestral writing, though containing many delightful pages, and much the same applies to the songs, albeit these also include many examples—he wrote over 100 in all—of rare beauty and charm.

(H. A. Sc.)

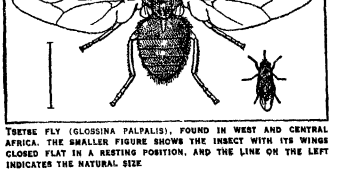
TSCHAKSTE, JAN (1859–1927), first president of the republic of Latvia, was born in Courland, Sept. 14, 1859. He was educated at the Mitau gymnasium, studied law at the University of Moscow, and was for some years in the public prosecutor's depart-

ment of the Courland Government. Leaving the public service in 1888, he started practice as a barrister in Mitau and began to edit the paper *Tēvija* (Fatherland). In 1902 he served on a committee appointed by the local administration to enquire into agricultural conditions in Courland, and from time to time was employed on various Imperial Government committees. In 1906 he was elected a member of the first Russian Duma. The German invasion of Courland, July 1915, obliged him to leave Mitau. He went to Petrograd (Leningrad) where he founded a central relief committee for war refugees. In 1916 he went to Stockholm to promote the cause of Lettish independence and published there in German his book, *Die Letten und ihre Latvija.*

In 1918 Tschakste was elected chairman of the People's Council and was later head of the delegation sent to Paris and London to secure the recognition of the republic of Latvia. He was president of the Latvian National Council and in 1920 he was president of the Latvian Constituent Assembly, and also became professor of international law at the University of Riga. On Nov. 14, 1922, he was unanimously elected president of Latvia by the first Latvian Saemia (parliament), and on Nov. 6, 1925, was re-elected for a further period of three years, but he died on March 14, 1927, before the completion of his term of office, after a long and painful illness. His activities as a statesman have been dealt with in special publications and, since his death, a memorial fund has been started.

TSCHUDI, GILES or AEGIDIUS (1505–1572), Swiss historian, a zealous Catholic, who became the chief magistrate or *landammann* of Glarus in 1558, and in 1559 was ennobled by the emperor Ferdinand, to whom he had been sent as ambassador. He is best known as the historian of the Swiss Confederation. His great work is the *Chronicon helveticum*, or *Eidgenössche Kronik*, dealing with the period from 1000 to 1470. In spite of its many inaccuracies, falsifications and acceptance of baseless legends (comp., *e.g.*, the article, TELL, WILLIAM) this work is one of great interest and merit, and was long considered the leading authority on its subject. It enshrines the text of many ancient documents that would otherwise have been lost.

Tschudi's chief works were not published until long after his death. The *Beschreibung Galliae Comatae* appeared under Gallati's editorship in 1758, and is mainly devoted to a topographical, historical and antiquarian description of ancient Helvetia and Rhaetia, the latter part being an early work on Rhaetia revised and greatly enlarged. This book was designed practically as an introduction to his magnum opus, the *Chronicon helveticum* above mentioned, which was published by J. R. Iselin in two stately folios (1734–1736). *See* Lives by I. Fuchs (1805) and C. Vogel (1856).



TSĒNG KUO-FAN (1811–1872), Chinese statesman and general, was born in 1811 in the province of Hunan, where he took in succession the three degrees of Chinese scholarship. In 1843 he was appointed chief literary examiner in the province of Szechuen, and six years later was made junior vice-president of the board of rites. The Taiping rebels were overrunning Hunan, and Tsēng was ordered to assist the governor of the province in raising a volunteer force, and on his own initiative he built a fleet of war junks, with which he attacked the rebels. His lieutenants recovered the capital, Chang-sha, and destroyed the rebel fleet. Following up these victories of his subordinates, Tsēng recaptured Wuchang and Hanyang, near Hankow, and was rewarded for his success by being appointed vice-president of the board of war. The rebels retook Wuchang and burnt the protecting fleet. Tsēng, however, succeeded in clearing the country round the Poyang lake, and subsequently in ridding the province of Kiangsu of the enemy. In 1857 he took supreme command in Cheh-kiang. Subsequently the rebels were driven westwards and Tsēng then cleared the province of Ngan-hui of rebel bands.

In 1860 he was appointed viceroy of the two Kiang provinces and Imperial war commissioner. At this time, and for some time previously, he had been fortunate in having the active support of Tso Tsung-t'ang, who at a later period recovered Kashgar for the emperor, and of Li Hung-Chang. In 1862 he became assistant grand secretary of State. At this time the Imperial forces, assisted by the "Ever-victorious Army," had checked the progress of the rebellion, and Tsēng was able to carry out a scheme which he had long formulated of besieging Nanking, the rebel headquarters. While Gordon, with the help of Li Hung-Chang, was clearing the cities on the lower waters of the Yangtse-kiang, Tsēng drew closer his besieging lines around the doomed city. In July 1864 the city fell into his hands, and he was rewarded with the rank and title of marquis.

After the suppression of the Taipings the Nienfei rebellion, closely related to the former movement, broke out in Shantung, and Tsēng was sent to quell it. He failed, and was relieved of his command by Li Hung-Chang, who succeeded him in the viceroyalty of Chihli. Tsēng died in 1872.

Tsēng was a voluminous writer. His papers addressed to the throne and his literary disquisitions are held in high esteem by the scholars of China, who treasure as a memorial of a great and uncorrupt statesman the edition of his collected works in 156 books, which was edited by Li Hung-Chang in 1876. (R. K. D.)

TSETSE FLY, the name given to any one of the twenty species of *Glossina*, a genus of African blood-sucking flies of the family Muscidae, order Diptera (*q.v.*). In appearance they are brownish insects banded or mottled with darker markings: they are somewhat larger than the housefly and have a prominent proboscis projecting horizontally in front of the head. Their habit of resting with the wings closed flat, one over the other, on the back enables them to be distinguished from other blood-sucking flies. The female insect does not lay eggs but brings forth at intervals a single fully-grown larva which is deposited on the ground, where it speedily conceals itself in some shady place and turns to a pupa. The flies abound where there is bush or forest, often frequenting the margins of rivers, lakes and islands; they are not found continuously but are restricted to areas known as fly belts. Both sexes are active blood suckers and are most troublesome during the hotter parts of the day, attacking both man and domestic animals. They are of great economic significance because they act as carriers of the pathogenic organisms (trypanosomes) which are responsible for fatal diseases in man and animals. When a tsetse fly alights on an infected subject and sucks its blood, numbers of the trypanosomes may be taken in at the same time. These tiny organisms require to undergo a developmental phase within the fly and when it is completed, are ready to pass into the blood of any man or animal upon which the fly happens to feed. In this manner the tsetse fly *Glossina palpalis* transmits *Trypanosoma gambiense*, the causal agent of sleeping sickness from man to man by means of its piercing mouth-parts, and in a similar fashion *Glossina morsitans* transmits *Trypanosoma rhodesiense*, which is responsible for the more local or Rhodesian form of that disease. This same species of tsetse fly is also the principal carrier of *Trypanosoma brucei*, which causes nagana disease among domestic animals. Five other kinds of tsetse fly have been proved experimentally to be capable

TSETSE FLY (GLOSSINA PALPALIS), FOUND IN WEST AND CENTRAL AFRICA. THE SMALLER FIGURE SHOWS THE INSECT WITH ITS WINGS CLOSED FLAT IN A RESTING POSITION, AND THE LINE ON THE LEFT INDICATES THE NATURAL SIZE

of transmitting trypanosomes, and it is probable that a number of species are natural carriers of the diseases mentioned.

The development of communications has probably been responsible for the spread of sleeping sickness from West Africa to eastern Central Africa where the population had acquired no immunity In the five years 1901–06 it is stated that over 200,000 natives died of the complaint in Uganda, where it was previously unknown, and the local tsetse flies until then were believed to have been uninfected with the trypanosome. The island population of Lake Victoria Nyanza suffered most seriously from this outbreak. Among the various methods which have been tried to control the fly, the clearing of vegetation around villages, so as to make such localities unsuitable for the insect, is now receiving attention. No feasible methods of luring or poisoning the insect are known, while the destruction of the concealed pupae presents great difficulties if carried out on a sufficiently extensive scale. The utilization of natural parasites has received some attention but at present offers little prospects of success. It has been proved experimentally that monkeys can be infected with the sleeping sickness trypanosome, and certain wild game, including antelopes, are regarded as functioning as "natural reservoirs" for trypanosomes although they themselves apparently suffer little ill effects.

M Swynnerton, *The Tsetse Flies of East Africa*, vol. 84 of the Royal Entomological Soc. (1936). An account of the ravages of sleeping sickness is given by G. D. H. Carpenter in *A Naturalist on Lake Victoria* (1920). (A. D. I.)

TSHI, a group of Negro peoples of the Gold Coast (*q.v.*). The chief of these are the Ashanti and Fanti.

TSIMSHIAN, an American Indian linguistic stock on Nass and Skeena rivers and Milbank sound, British Columbia. They are typical north Pacific coast tribes, forming, with the Tlingit, the Haida and certain Athabascans of the adjacent interior, a matrilineal sub-culture group. The four Tsimshian phratries, Raven, Wolf, Eagle and Grizzly Bear, are distributed through the three tribes composing the stock, namely Tsimshian proper, Niska and Gitksan. Population, originally estimated, 7,000; 1906, 3,700.

TSINAN: *see* CHINAN.

TSINGTAO, a port on a large inlet named Kiaochow bay, on the south side of the base of the Shantung peninsula, China. The bay was occupied by Germany after the murder of two missionaries in Shantung in 1897, and negotiations followed, resulting in a lease of land to Germany for 99 years. The area leased was about 117 sq.mi., and all points within 32 mi. of any point on the bay were held not to be affected by Chinese ordinances without German consent. A free port was created in 1899, and a branch of the imperial maritime customs was established there for collection of duties on shipments to and from the interior, in accordance with the general tariff. Tsingtao, on the bay, became the port and chief centre, and the German government created educational and agricultural institutions in the leased territory, and fortified the port Japanese forces took the place in 1914, and held it till 1922, when it was returned to China under the Washington agreement. The port is connected with Tsinan, the capital of the province of Shantung, by rail. The port fell early in 1938 into Japanese hands after the Chinese had destroyed the textile mills. Area of municipality, 289 sq.mi.; pop. (1940) 590,374.

The Siege of Tsingtao.—The first part which Japan took upon herself to play in World War I was the reduction of the German stronghold of Tsingtao, on the bay of Kiaochow. This fortress served at the outset of the war as the only base of operations in eastern Asia for the German marauders menacing the Allied trade routes. It was imperative to make von Spee's raiders homeless, and the military and naval operations against the redoubtable base, which was under the command of Capt. Meyer-Waldeck and garrisoned by some 13,000 men, of whom 5,599 were German regulars, were started with the utmost dispatch. On Aug. 27, 1914, the blockade of Kiaochow bay was declared by the Japanese navy, and Lungkow, 150 mi. N. of Tsingtao, was chosen as the point for landing troops.

On Sept. 2, 1914, the Japanese division, under the orders of Lieut.-Gen. Kamio, commenced landing at Lungkow. Despite the terrible weather conditions, the vanguards arrived on the 12th at the small town of Tsimo, where they encountered the enemy for the first time. The second Japanese contingent began to land at Laoshan bay, within the leased zone, on Sept. 18 and soon established touch with the first army. The Japanese forces under Gen. Kamio thus amounted to about 22,980 officers and men, and they succeeded in some 10 days in wresting from the Germans several of their advanced positions. On Sept. 24 there arrived at the arena of campaign the British force, commanded by Gen. Barnardiston, consisting of 910 officers and men of the 2nd South Wales Borderers and 450 of the 36th Sikhs. After the noncombatants had been permitted to leave the fortress, the general attack of the position was commenced on Oct. 31, the Japanese blockading fleet off the harbour assisting by a continuous bombardment. On the morning of Nov. 7 white flags were descried on the forts of Moltke, Bismarck and Iltis, to the pleasant surprise of the attacking army, which had expected a protracted siege. After the fall of the stronghold it was ascertained that all enemy ships, including the Austrian cruiser "Kaiserin Elisabeth," had been sunk in the port of Tsingtao. The Japanese army lost during the campaign 1,968 killed or wounded, and the Japanese navy, a cruiser, a destroyer and a torpedo boat. The port of Kiaochow was reopened for trade by the Japanese on Dec. 28, 1914. (*See* WORLD WAR I: *Bibliography.*)

TSINLINGSHAN, a range of mountains which forms the southern wall of the Wei-ho valley and extends eastwards into the plain of north China (Honan). It forms a boundary in geology climate and human relations between the region of loess in the north and the basin of the Yangtze to the south. The Tapaling or Tapashan is a range diverging from it south-eastwards, with the valley of the Han between them. These mountains are often held to be structurally a continuation of the Kuenlun system and, like the Kuenlun, show folding of rocks up to the Upper Carboniferous age, with granites and gneiss in many places, especially in the north. The reduction in height from the great mountains of the Kuenlun system on the west to the Tsinlingshan on the east is very marked, though the latter reach 10,983 ft. and its average height is surprisingly great. The break between the Kuenlun system and these mountains is a part of the great break seen all along the east side of the Tibetan plateau. The north face is very steep, and loess reaches up to some 3,300 ft. above sea level at places along it. The top of the range is broad, with sharp heights. The south face has rounded heights and wild, deep-cut valleys. In spite of its size and height the range is essentially one mass, and not a complex of chains such as we find, for example, in the Alps. The Chinese were interested in and occupied the Han valley in distant antiquity, but until a way was worked out across the Tsinlingshan, these had to pass south-eastwards up the Tankiang, a long detour if the ultimate goal were Han-chung-fu, or, perhaps, Chengtu in Szechwan.

TSUSHIMA, an island belonging to Japan, situated about midway between Korea and the island of Iki, so that the two islands were used as places of call in former times by vessels plying between Japan and Korea. Tsushima lies about 34° 20′ N., 129° 20′ E. It has an area of 271 sq.mi and a population (1950) of 60,376. It is divided at the waist by a deep sound (Asaji-ura), and the southern section has two hills, Yatachi-yama and Shira-dake, 2,106 ft. and 1,680 ft. high, respectively, while the northern section has Ibeshi-yama and Mi-take, whose heights are 1,128 ft. and 1,598 ft. The chief town is Izuhara. The Mongol armada visited the island in the 13th century and committed great depredations. In 1861 an attempt was made by Russia to obtain a footing on the island. The name of the battle of Tsushima is given to the great naval engagement of May 27–28, 1905, in which the Russian fleet under Admiral Rozhestvenski was defeated by the Japanese under Admiral Togo.

TSWANA, otherwise BATSWANA or BECHUANA, a Sotho people of southern Africa. *See* BECHUANALAND.

TUAM, a market town and episcopal city of County Galway, Ire., 20 mi. N.N.E. of Galway on the Great Southern railway. Pop. (1951) 4,010. It is the seat of a Roman Catholic archbishopric and of a Protestant bishopric. The cross of Tuam, re-erected in modern times, bears inscriptions in memory of Tur-

logh O'Conor, king of Ireland, and O'Hoisin, successively (1128) abbot of St. Jarlath's Abbey and archbishop (1152) of Tuam, when the see was raised. St. Jarlath's Roman Catholic college is a seminary founded in 1814 for the education of priests.

TUAN CHI-JUI (1864–1936), Chinese politician, was born in Anhwei. He succeeded Yuan Shih-kai as viceroy of the Hukuang Province, and was one of the signatories to the memorial of Jan. 1911, urging the Emperor to abdicate. He was acting Premier from May to July 1913, Minister of War in 1914, and Premier in April 1916. In Oct. 1918 he resigned, and, after an ill-advised coup on behalf of the Anfui Club, played no great part in affairs till Nov. 24, 1924, when he succeeded Tsao Kun as President.

TUAPSE, a town on the Black Sea in the Krasnodar territory of the Russian S.F.S.R., in 44° 10′ N., 38° 59′ E., linked by a branch line with Armavir on the Rostov-Baku railway. It has oil refineries working on oil from the Groznyi district, to which it is connected by a pipe line. Population 34,000 in 1933.

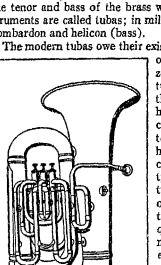
TUAREG, also **TAWAREK** (sing. *Targi*), the name given by Arabs to the western and central Saharan Berber peoples in the desert from Tuat to Timbuktu and from Fezzan to Zinder, an area of about 1,500,000 sq.mi. The Tuareg resort to the centres from which the trade routes radiate, Timbuktu, Ghat, Ghadames, Murzuk and Tuat. Their general colour is reddish yellow Their hair is long, black and silky, beards black and thin, eyes generally black; noses small, hands delicate, and bodies muscular. They are tall and graceful.

The aristocratic section is called *Tmajogh;* Arabs call them *muleth themun* (veiled people). The men wear the veil day and night, the women never. The Tuareg, at any rate the noble class, are among the purest of the Berber stocks but have become largely Arabised. The script is known as T'ifinagh, consists of 40 to 50 symbols They dress generally in a black tunic (some wear white); trousers of white cotton, and wear a cloth called *litkam* or *tagilmus,* the end of which is drawn over the face, leaving visible only the eyes and the tip of the nose. These cloths are dark blue or white. To this difference of colour is due the terms "black" and "white" Tuaregs.

Socially the Tuareg are divided into six classes, viz.: *Imajeghan* or nobles; *Marabout* or priests; *Imghad* or serfs; *Irejanaten* or mixed people, issue of noble and Imghad; *Ikelan* negro slaves and *Buzu* outdoor slaves. The nobles are all pure blooded and provide the tribal chiefs. They do no manual work. Among the Imghad serfdom is hereditary, and they are bound collectively to a noble tribe or group of tribes. The Tuareg weapons are a straight two-edged sword about 4 ft. long, a dagger bound to the left forearm and spears and leathern shields.

See Heinrich Barth, *Travels in Central Africa* (1858); W. J. Harding King, *A Search for the Masked Tuaregs* (London, 1903); M. Benhazera, *Six Mois chez les Touareg du Ahaggar* (Algiers, 1908); Lieut C Jean, *Les Touareg du sud-est* (Paris, 1909); E. Doutté, *Magie et religion dans l'Afrique du nord* (Algiers, 1909); E. F. Gautier, *Le Sahara* (1923); F. R. Rodd, *People of the Veil* (1926).

TUAT, a word sometimes applied generally to all the oases in the western part of the Algerian Sahara, *i.e.,* between 2° W. and 2½° E. 26° and 30° N., sometimes restricted to a particular group which borders the east side of Wad Messaud between 26½° and 27½° N. According to the first usage Tuat includes the oases of Gurara in the north and Tidikelt in the south with the important centre of Insalah. The three groups are spoken of collectively by the French as the Tuat archipelago. The district is comparatively fertile, and produces dates and some cereals and vegetables The wadi Saura (known in its lower course as the Messaud), formed by the junction of the wadis Zusfana and Ghir, marks the north-western boundary of the oases. The inhabitants live in *ksurs* or fortified villages, grouped in districts. The Tuat group forms part of the Southern Territories of Algeria; Gurara and Tuat are attached to the territory of Ain Sefra and to the native commune of Timimun. Tidikelt to the Oasis territory and to the native commune of Wargla. The pop. is (1936) 57,815, of which Gurara and Tuat have 40,576 and Tidikelt 17,239 The principal ksurs are in Gurara, Timimun (pop. [1936] 5,394). Deldoul (2,694); at Tuat, Timmi (2,079). Kaouïa-Kounta (2,536); at Tidikelt, In Salah (13), In-Ghar (1,370). The district commands the routes southwards to Timbuktu and the Sudan.



The oases appear to have been inhabited from a very early period. The Arabs took possession in the 10th century and imposed Islam upon the people. The treaty of 1845 between Morocco and France left the question of the possession of Tuat, Gurara and Tidikelt unsettled. In 1890 a French scientific mission, under Flamand, was despatched to the oasis of Tidikelt. The French were attacked by the natives (Dec 28, 1899), whom they defeated. This was the beginning of a campaign which ended in March 1901 in the complete occupation of the oases and of the Zusfana-Saura line of communication. The French were not, however, left in peaceable possession. Attacks by the nomad tribes, were made on the line of communications, and during 1903 the French troops suffered serious losses To punish the tribes the town of Figig was bombarded (June 8, 1903). From 1904, the methods of governor Jonnart and of General Lyautey brought about rapid pacification. In 1905, the extension of the railway from South Oran to Colomb Bechar, which had been occupied in Nov. 1903, definitely stabilised French domination in that region.

Major A. G. Laing visited the Tuat territory in 1825, but his papers were lost. The next European to visit Tuat was Gerhard Rohlfs, who described his explorations in *Tagebuch seiner Reise durch Marokko nach Tuat, 1864* (Gotha, 1865) and *Reise durch Marokko . . . Exploration der Oasen von Tafilet, Tuat und Tidikelt . . .* (Bremen, 1868). E. F. Gautier, *Sahara algérien* (Paris, 1908), Id *La conquête du Sahara,* Paris, 1910; Id *Le Sahara,* Paris, 1923, G. B. M Flamand. *Recherches géologiques et géographiques sur le haut-pays de l'Oranie et sur le Sahara,* Lyon, 1911. Augustin Bernard and N. Lacroix, *La pénétration saharienne,* Alger, 1906; *Les territoires du Sud de l'Algérie* 3 vol., Alger, 1922.

TUBA, in music, the tubas—bombardon, helicon, euphonium —are a family of valved instruments of powerful tone forming the tenor and bass of the brass wind. In the orchestra these instruments are called tubas; in military bands euphonium (tenor), bombardon and helicon (bass).

The modern tubas owe their existence to the invention of valves or pistons by two Prussians, Stölzel and Blümel, in 1815. The tubas are often confounded with the baritone and bass of the saxhorns, being like them the outcome of the application of valves to the bugle family. There is, however, a radical difference in construction between the two types. Given the same length of tubing, the fundamental octave of the tubas is an octave lower than that of the saxhorns, the quality of tone being besides immeasurably superior. This difference is entirely due to the proportions of the truncated cones of the bore and consequently of the column of air within. By increasing the calibre of the bore in proportion to the length of the tube it was found that the fundamental note or first sound of the harmonic series was easily obtained in a full rich quality, and by means of the valves, with this one note as a basis, a valuable pedal octave, absent in the saxhorns, is obtained.

THE TUBA, THE DEEPEST TONED INSTRUMENT OF THE BRASS WIND FAMILY

The modern tuba finds its prototype in the Roman tuba. Compared with the other military service instruments of the Romans, the buccina and cornu, the tuba was straight and was used to sound the charge and retreat, and lead the soldiers in action.

TUBE. This term generally refers to a hollow cylinder or pipe for conveying liquids or gases. In botany it denotes the narrow basal portion of a gamopetalous corolla or a gamosepalous calyx.

For a discussion of the manufacture of metal tubing, *see* the article on IRON AND STEEL.

The manufacture and application of glass tubing is discussed under GLASS MANUFACTURE. Tubes for boilers (*i e*, fire tubing and water tubing), are treated under BOILERS and STEAM GENERATION. The term as used in the textile industry (*i e*, tube yarns), is found in articles related to textiles.

The application of the term to subsurface transit is found in the article RAILWAYS, TUBE. The article PNEUMATIC CONVEYING treats the use of tubes in postal and similar services. Under TYRE various types of inner tubes for vehicles are described The Coolidge tube and tubes used for X-ray treatment and radiotherapy are discussed under articles related to these subjects. The tubes used in lighting are discussed under LIGHTING AND ARTIFICIAL ILLUMINATION. For Estuary tubes *see* AQUEDUCTS.

Perhaps the most common use of the word in recent years has been in connection with vacuum tubes used in the radio These are discussed under THERMIONICS and ELECTRON TUBE.

Many special tubes applying to different fields of science and industry are found under various headings in their related fields. One device, however, which deserves mention here is the Knowles Grid-Glow tube or relay. This is a device for controlling electrical power which is so sensitive that it can be operated by the mere approach of the human hand. Superficially the Knowles Grid-Glow tube resembles the radio tube for it has the anode, the cathode and grid. However, it has no filament; the connection of the anode and cathode are the reverse of the radio tube; the grid is merely a piece of heavy wire and the tube is filled with neon, argon, or some other gas. The ordinary relay is a device which is operated by a small current which controls a much larger one. The relays commonly used in electrical engineering have an amplifying power of about 10,000, which means that they can control a current 10,000 times greater than the current controlling them. A Knowles Grid-Glow tube has an amplifying power of the order of 100,000,000 and it is probably the most sensitive thing of the kind ever devised. The energy required to operate it is about one one-thousand-millionth ($\frac{1}{1,000,000,000}$) of a watt This small amount of energy is sufficient to start a current of 25 milliamperes flowing through the tube. This current is sufficient to close or open a switch of 25 amperes and this in turn to control almost any operation. It is possible by use of this relay to turn on the lights of the city, start a railway train, or manoeuvre a battleship. The tube is the invention of Knowles of the Westinghouse Electric and Manufacturing Co.

TUBE RAILWAYS: *see* RAILWAYS, TUBE.

TUBERCULIN. In 1890 Robert Koch found a specific substance produced in artificial culture media durnng the growth of tubercle bacilli (*Mycobacterium tuberculosis*) which he called tuberculin. It caused an inflammatory reaction when injected into animals or people previously infected with the tubercle bacillus but not in uninfected individuals. His original preparation, called old tuberculin (OT), was made by concentrating the whole germ-free culture liquid to one-tenth the original volume and filtering off the bacilli. This tuberculin has been used for the diagnosis of tuberculosis. An enormous variety of other tuberculin preparations have been proposed.

Many attempts have been made to isolate the active fraction, which proved to be protein. One of the purest products isolated is the purified protein derivative (PPD) which was used extensively for diagnosis after 1934 in the U.S. and other countries. This product was isolated from filtrates of heated human tubercle bacillus cultures grown upon a synthetic nonprotein medium It consists of the purified proteins of tuberculin, free from the germ and all other substances. It is so potent that only 0.00002 mg. is required to give a positive reaction in 94% to 96% of all individuals with active tuberculous infection. If no reaction occurs with this dose in 48 hr. a second test with 0.005 mg. is usually given to detect those infected with less virulent strains, such as BCG. A patient giving a negative reaction to this dose is considered uninfected. A very few individuals fail to react in spite of known infection. Larger doses are not used because there are indications that they give nonspecific or primary toxic reactions. A single dose of 0.0001 mg. is frequently used.

Tuberculin Test.—One of the most popular methods of administering tuberculin is known as the Mantoux test. A small amount of tuberculin (0.1 cc.) is injected intracutaneously, usually on the flexor surface of the arm, and if the subject reacts positively, swelling and redness develop at the site of injection within 24 hr. Other methods of testing, generally considered less accurate, have been used, such as the scratch technique, the patch test, the ophthalmic method, and subcutaneous injection.

The specificity of the reaction is very great For example. practically 100%of guinea pigs artificially infected with tubercle bacilli, or individuals vaccinated with the attenuated tubercle bacilli (BCG), react to tuberculin On the other hand, in a population group in Dutch Guiana where there was no infection with tubercle bacilli only negative reactions to tuberculin were found.

The extent of tuberculosis infection in any locality can be determined approximately by finding the percentage of reactors to tuberculin. In this way it has been determined that the rate of infection varies greatly in different parts of the world, in different sections of the same country and even in different groups within a city, and that such rates are correlated with the intensity of exposure, which usually reflects the prevailing economic and sanitary conditions. A positive reaction, however, merely indicates infection with the tubercle bacillus. Such infection in most cases does not give rise to active disease, as determined by the X-ray film. The test is a help to the doctor in determining the source and time of an infection, and in distinguishing between tuberculosis and other pulmonary diseases. A negative reaction usually excludes a diagnosis of tuberculosis.

Tuberculin Therapy.—Tuberculin was also used therapeutically by Koch. It is used very much less in pulmonary tuberculosis than formerly, but is frequently employed in the treatment of tuberculosis of the eye and other forms of nonpulmonary tuberculosis. In these cases a series of injections of increasing dosages, beginning with a 1:100,000 dilution of old tuberculin, aiming at desensitization, is given.

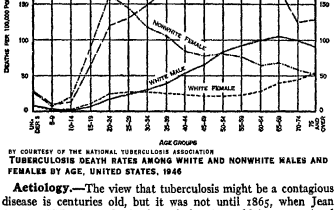
TUBERCULOSIS. Tuberculosis is an infectious disease of man and animals caused by the tubercle bacillus (*Mycobacterium tuberculosis*), which belongs to the acid-fast group of bacteria (*Mycobacteria*), and of which several types exist, including the human, bovine and avian. The principal form of the disease in man is pulmonary tuberculosis.

Prevalence and Mortality.—Tuberculosis is world-wide in its distribution and the chief cause of mortality in many parts of the earth. The death rate is especially high in densely populated countries with poor hygiene It declined steadily in the 20th century in all industrialized nations, except for periods of war and national catastrophe. In the U.S. the rate (all forms of tuberculosis) dropped from 194 per 100,000 population in 1900 to 36 in 1947, and in England and Wales from 191 for the period 1896–1900 to 53 in 1946.



Tuberculosis was the chief cause of death in the U.S. until 1909 and seventh in 1947, being exceeded in that year by heart diseases, cancer, intracranial lesions of vascular origin, accidents, nephritis and pneumonia. In 1947 in the U.S. 48,064 deaths from tuberculosis were recorded.

It is calculated that in general the prevalence is approximately nine times the mortality, but both prevalence and mortality vary considerably in different circumstances. In general, tuberculosis rates are higher in urban than in rural communities, because of crowding, greater opportunity for infection and the frequent hygienically less favourable position of large parts of some cities.

However, with economic improvement, better sanitation, more widespread education and particularly with the establishment of public health practice, including specific measures for tuberculosis control, many cities have lower tuberculosis rates than adjacent rural areas. In the U.S. the chief factor influencing the mortality rate is the relative proportion of Negro inhabitants. The over-all mortality rate from tuberculosis is three times as high in Negroes as in whites. In New York city, with an estimated population of 7,835,293, the tuberculosis mortality rate was 40 in 1947, but in central Harlem, with a predominantly Negro population, the rate was 157, while in adjoining Westchester county, a district with relatively few Negro inhabitants, the rate was only 25.

Economic conditions have a notable effect on the rate. The well-to-do and professional classes exhibit a low rate, while unskilled labourers have a high rate. A study by J. S. Whitney based on death rates in the U.S. in 1930 revealed a rate for unskilled labourers seven times as high as that among professional men. Sex and age are equally important.

The chart shows how mortality varied with sex, age and race in the U.S. in 1946.

TUBERCULOSIS DEATH RATES AMONG WHITE AND NONWHITE MALES AND FEMALES BY AGE, UNITED STATES, 1946

Aetiology.—The view that tuberculosis might be a contagious disease is centuries old, but it was not until 1865, when Jean Antoine Villemin in Paris showed that it could be transmitted from tuberculous to healthy animals by inoculation, that it was proved to be due to an infecting agent. The actual cause, the tubercle bacillus, was discovered by Robert Koch in Germany in 1882. The bacillus is the best-known member of the family of acid-fast bacteria, distinguished by their capacity to resist destaining by such reagents as acids, alkalies and alcohol when once stained with aniline dyes like fuchsin. As compared with other bacteria it grows slowly in artificial culture media. Once isolated it may be grown readily in large quantities on simple media of well-defined chemical structure, containing glycerol, nitrogen in the form of ammonia or the amino group, and inorganic salts. It is relatively resistant to the usual disinfecting agents, and withstands drying for long periods. It is killed quickly by sunlight and ultra-violet light from artificial sources.

The bacillus is a rod from one-half micron to four microns in length which reproduces, as microcultures by Morton C. Kahn showed, by a complex division into minute particles from which new bacilli arise. It does not pass through porcelain filters, although claims for the existence of filterable forms have been made. Colony growth on solid culture media is of two types, "rough" and "smooth," which exhibit differences in virulence.

Advantage has been taken of its capacity to grow on media of known composition, to make exact studies of its chemical composition. In the bodies of bacilli grown on such media, lipids, carbohydrates and proteins occur in approximately equal proportion. The lipids of the bacillus were shown by R. J. Anderson to be distinctive for acid-fast bacteria, and one of them, a phosphatide containing a specific fatty acid, phthioic acid, was shown by Florence Sabin and associates to stimulate in animal tissue the histologic changes characteristic of tuberculosis. Certain waxy constituents of the bacillus were shown by Anderson and his co-workers to play a role in the phenomenon of acid-fastness. The proteins are extremely important, for they include the specific substance tuberculin, which is a valuable diagnostic agent and which is believed to be responsible for many of the toxic manifestations of tuberculosis in the body. The physicochemical studies of Florence Seibert showed that proteins of different tuberculin potency occur in the filtrate from cultures of tubercle bacilli, and that extremely minute amounts of certain of the proteins will elicit a tuberculin reaction. (*See* TUBERCULIN.)

Mode of Transmission.—Tuberculosis is transmitted to healthy bodies by way of the respiratory and alimentary tracts, and rarely by direct inoculation through the skin. Most tuberculosis is acquired by inhalation of bacilli from the sputum of persons with ulcerative pulmonary tuberculosis. Investigation has shown that the minute droplets may be discharged by cough or sneeze, and droplets of such size, sometimes containing hundreds of tubercle bacilli, may float in the air for many minutes or even hours. Experimental evidence indicates also that bacilli in thoroughly dried and ground sputum may be inhaled and prove infective. Specific procedures, including sterilization of the air by ultra-violet light and treatment of clothes, bedding and floors with an oily preparation to reduce dust, are used by hospitals to reduce the hazard of inhalation.

The principal source of primary infection by way of the alimentary tract is contaminated milk. Secondary, endogenous infection of the alimentary tract, from swallowing sputum discharged from tuberculous ulcerations in the lungs or bronchi, is frequent in advanced pulmonary tuberculosis. In milk from cattle with infected udders, bacilli may be numerous, and the practice of pooling milk from several dairies may distribute tubercle bacilli widely in a city's milk supply if pasteurization is not practised. The bacillus concerned is the bovine type.

Pathology.—The anatomic unit of tuberculosis is a highly characteristic pathological formation known as the tubercle. When tubercle bacilli lodge in tissues the first reaction is an outpouring of polymorphonuclear leucocytes which surround and engulf the bacilli. This phase of reaction is over within a few hours, and is succeeded by a stage of infiltration of large mononuclear phagocytic cells which enlarge, with production of abundant cytoplasm, and engulf the polymorphonuclear leucocytes and their content of tubercle bacilli. The enlarged mononuclear cells, because of an early fancied resemblance to epithelial cells, have long been known as "epithelioid" cells. The latter tend to assume a radial arrangement around the site of infection, and among them appear large cells, designated by the name of an early describer as "Langhans' giant cells." These differ from the usual giant cells of foreign-body reaction in tissue in a distinctive arrangement of their nuclei. The giant cells arise from epithelioid cells as a result of fusion or incomplete division of the latter. In the normal course of development of the mass of epithelioid cells a specific type of necrosis of the central portion occurs, which is designated as "caseation" necrosis because of its cheese-like appearance when seen in large tuberculous masses. In time fibroblasts appear at the periphery of such an epithelioid mass. The complete structure, with a caseous centre, a zone of radially arranged epithelioid cells and a periphery of young mononuclear cells and fibroblasts, still microscopic in size, is known as an epithelioid tubercle. Most of the visible manifestations of tuberculosis, from barely visible nodules to large tuberculous masses, are fundamentally conglomerations of such tubercles, in which caseation necrosis progresses. Under certain circumstances large caseous masses tend to soften, and if such softened areas discharge their content into a segment of the bronchial tree, a cavity results. In typical pulmonary tuberculosis, concomitantly but varying in degree according to individual circumstances, exudation occurs into the pulmonary alveoli, and frequently into the pleural space.

In time reparative processes occur, with evolution of a chronic lesion characterized by localized destruction and scarring, with surrounding exudation.

The principal site of tuberculosis is the lung. Ordinarily pulmonary tuberculosis is a chronic disease, although many of the manifestations that enter into its complex character are acute, and rapidly progressive pneumonic forms, almost entirely exudative in character, occur. The typical lung of chronic advanced tuberculosis is characterized by cavity formation and scarring in the upper part, tuberculous consolidation with smaller cavities in the zone immediately below, and scattered shotlike tubercles in the lower regions. Ulceration, the result of the softening process described above, is the immediate cause of the chain of events leading to progressive tuberculosis. When this occurs, semiliquid material containing tubercle bacilli is poured into the bronchial tree and aspirated into adjacent bronchi, with the production of new tuberculosis, called "bronchogenic" from its mode of origin. As the disease progresses, new cavities develop and the process is repeated. At the same time reparative processes are under way, and scarring may be extensive.

Pulmonary Tuberculosis; Clinical Features.—Approximately 90% of all clinically recognized tuberculosis is pulmonary. The disease is insidious in onset and early course, and may reach a moderately advanced stage before identifying symptoms are manifest. The chances for cure are immeasurably better when the disease is discovered in an early rather than advanced stage. Control, therefore, depends largely on early diagnosis.

Several classifications of pulmonary tuberculosis are in use. That recommended by the National Tuberculosis association in the U.S. is widely employed. It distinguishes primary and reinfection types of the disease, and minimal, moderately advanced and far advanced stages. Primary tuberculosis (first infection) was formerly most frequent in children. In contrast to the reinfection type of tuberculosis in adults, first infection tuberculosis in children occurs in any part of the lung, and the draining lymph nodes soon become involved. The course in children is usually benign, and healing occurs in both the primary lung focus and regional lymph nodes, with scarring and calcification, leaving two or more nodules which are often readily visualized in chest X-ray films, and are easily found on post-mortem examination. The healed lesion is commonly designated as a primary complex; its development was traced with great care by the Austrian pathologist Anton Ghon. Severe forms of primary tuberculosis sometimes occur in children, with rapid pneumonic progression, or with invasion of the blood stream and death from miliary tuberculosis or meningitis.

With improved measures for tuberculosis control primary infection is less frequent in children. First infection with tubercle bacilli may take place in later life, when in its localization and character, it commonly resembles reinfection-type tuberculosis in adults more closely than it does primary tuberculosis in children.

Reinfection-type tuberculosis represents disease from repeated infection with tubercle bacilli. The bacilli concerned may come from fresh infection from a new source (exogenous infection) or from an already existing focus in the body (endogenous infection). Reinfection-type tuberculosis, in generally accepted classifications, is subdivided on the basis of its anatomical extent and the presence or absence of gross cavity formation, into minimal, moderately advanced and far advanced stages. Its onset is often difficult to detect. Fatigue, afternoon and evening fever, weight loss and cough are the usual symptoms. With advance of the disease these symptoms become more severe, and others may occur, the most striking of which is haemorrhage from the lungs (haemoptysis). Pleurisy with effusion of fluid into the pleural space is common.

Diagnosis is made by a combination of methods. Discovery of the tubercle bacillus in the sputum establishes it beyond question. In early stages this may not be possible, for tubercle bacilli do not appear in the sputum until ulceration of the lesion has occurred. Prior to the development of X-ray techniques chief reliance was placed on physical examination, with emphasis on differences in density of the lung, evident on percussion, and the detection of characteristic *râles* on auscultation with the stethoscope. X-ray evidence of infiltration of the lung is highly important in establishing the diagnosis. Early tuberculosis of minimal extent is usually found in the upper part of one lung, either above or below the clavicle.

Sputum is examined by a special staining technique used to detect acid-fast bacteria, either by direct smear of a selected portion of the expectorated material, or by concentration methods in which a large amount of sputum is reduced to a small volume by chemical treatment and centrifugalization. In cases where the presence of tubercle bacilli is suspected, but the amount of sputum is too small for examination, the contents of the stomach, containing small accumulations of swallowed sputum, may be aspirated and examined. When the number of bacilli is too small for detection by staining methods, they may be found by culture methods or inoculation of guinea pigs.

Pulmonary tuberculosis is treated by rest, good nutrition and hygiene and by certain specific measures, of which various methods for the collapse and enforced rest of the affected lung are particularly important. All methods require treatment over many months. Treatment is best carried out in a tuberculosis hospital. The chief methods of collapse treatment are artificial pneumothorax and thoracoplasty. In the former, air is allowed to enter between the two pleural surfaces and the lung collapses. It is often necessary to sever adhesions between the pleural surfaces in order to make this treatment effective (pneumonolysis). After cure the lung is allowed to re-expand. In thoracoplasty the upper portion of the rib cage is removed by surgery, periosteum being left to regenerate bone, so that a new and very much smaller rib cage is ultimately left. The lung is confined to a small space and the affected part permanently immobilized. Other operative procedures, including pneumonectomy (removal of one lung) and lobectomy (removal of a lobe of a lung), are also employed.

Many drugs have been used in the treatment of tuberculosis, most of them without success. Some value was found in drugs of the sulphone series, including promin, promizole and diasone, but these proved too toxic for general use. In 1944 streptomycin, first employed in the therapy of tuberculosis by H. C. Hinshaw and W. H. Feldman, was found to exert a favourable effect, particularly on miliary tuberculosis, tuberculous meningitis, tuberculous sinuses, tuberculous laryngitis and bronchial tuberculosis. Other drugs, including para-amino-salicylic acid, are used effectively as adjuncts to streptomycin. (*See* also HEART AND LUNG, SURGERY OF.)

Nonpulmonary Tuberculosis.—Approximately one-tenth of clinically recognizable tuberculosis is nonpulmonary. The organs chiefly affected are the lymph nodes, bones and joints, serous surfaces, genital organs, kidneys, adrenal glands and skin. Lesions in these organs are usually caseous and there is a tendency for tuberculous abscesses and sinuses to develop. Tuberculosis of the intestines is common, but is usually a complication of pulmonary tuberculosis. Generalized tuberculosis of the lymph nodes (scrofula) was at one time one of the most frequent manifestations of tuberculosis, but with improved hygiene has become rare. Tuberculosis of the bones and joints is a grave disease requiring immobilization for arrest and usually leaving permanent damage to function when healing occurs. Tuberculosis may destroy the adrenal glands, in which case Addison's disease (*q.v.*) results. In countries where bovine tuberculosis is not well controlled, nonpulmonary tuberculosis caused by infection with bovine-type tubercle bacilli is frequent. In the treatment of nonpulmonary tuberculosis, rest of the affected part is secured, in so far as possible. When practical, as in the case of tuberculosis of a single kidney, surgical measures are employed.

Generalization of tuberculous infection, with dissemination through the blood stream, is a not-rare complication of nonpulmonary tuberculosis. Miliary tuberculosis is a highly fatal form, in which small nodules, likened by early investigators to millet seeds (and hence the term "miliary"), are scattered throughout the body. They represent individual implantations of tubercle bacilli discharged into the blood stream from a tuberculous focus which invades a vein wall, and are conspicuous in the lungs, in which they give rise to a characteristic X-ray picture. Tuberculous meningitis, the most severe of all forms of tuberculosis, is a frequent complication of miliary tuberculosis; at times it occurs

without grossly evident miliary tuberculosis.

Resistance and Immunity.—Resistance and immunity in tuberculosis may be natural or acquired. Certain animals, like the monkey and guinea pig, are highly susceptible to the disease; others, like the cat, dog and horse, are relatively resistant. Some animals are susceptible to invasion by one type of tubercle bacillus and not by others. The rabbit succumbs to infection by bovine and avian strains of bacilli, but is resistant to the human type. Man is virtually immune to the avian type, but suffers from progressive disease caused by human- and bovine-type bacilli.

Heredity and constitution play an important part in determining the outcome of tuberculous infection. Before the discovery of the tubercle bacillus heredity was believed the chief determinant in man. That heredity is a vital factor in resistance has been proved experimentally by several investigators. In a long series of investigations from 1932 to 1949, M. B. Lurie showed that inbred strains of rabbits of different genetic constitution varied considerably in their resistance to tuberculosis and in the character assumed by the disease.

Racial variation in resistance to tuberculosis has also long been recognized. In 1908 S. Lyle Cummins called attention to the high rate of tuberculosis in Sudanese troops in Egypt; his subsequent studies indicated great susceptibility in "primitive" peoples in general. Negroes are more severely affected by the disease than whites, and different white stocks appear to vary in resistance. The significance of the higher death rate for Negroes in the U.S. is complicated by the generally unequal environmental conditions of the two races. Pathological studies disclose differences in the character of the disease in the two races, however; more extensive caseation necrosis and more frequent nonpulmonary tuberculosis is evident in the Negro.

Studies of populations in periods of deprivation show a correlation between nutritional deficiencies, particularly in proteins and vitamins, and increase in tuberculosis. Certain diseases, notably silicosis, depress resistance to tuberculosis.

Enhancement of resistance by infection itself is easily demonstrated experimentally. Animals inoculated with tubercle bacilli of low virulence reveal much greater resistance to subsequent infection with virulent tubercle bacilli than do normal animals. Advantage is taken of this fact in vaccination against tuberculosis. Animals, including man, when infected with tubercle bacilli, in addition to manifesting increased resistance to further infection from without, develop a remarkable hypersensitivity to a protein substance derived from tubercle bacilli (*see* TUBERCULIN). The virtually invariable development of hypersensitivity to tuberculin following infection of man and cattle with tubercle bacilli, regardless of the severity of infection, makes tuberculin valuable in detecting tuberculous infection and determining its prevalence in human groups and herds of cattle

Prevention and Control.—Specific measures for the control of tuberculosis were inaugurated by Sir Robert W. Philip in Edinburgh, Scot., in 1887, by establishment of a tuberculosis dispensary in which patients convalescing from tuberculosis could be watched carefully and persons from households with a tuberculosis patient could be observed to detect evidence of developing disease. At the same time, through regular home visiting by dispensary personnel, efforts were made to improve the standard of living of the families under supervision, while the dispensary itself acted as a centre for the dissemination of knowledge concerning tuberculosis. In 1889 in New York, Hermann M. Biggs, with his colleagues T. M. Prudden and H. P. Loomis, developed a similar plan based on the contagiousness of tuberculosis and need for protection of the public. Ultimately the Biggs program, including compulsory reporting of the disease to the department of health, was adopted *in toto* by the New York city department of health, and public health measures for the prevention of tuberculosis became recognized as a governmental obligation. In the development of a sense of public responsibility in the control of tuberculosis, voluntary agencies played a great part. In the U.S. the National Tuberculosis association, founded in 1904, in Great Britain the National Association for the Prevention of Tuberculosis and in Canada the Canadian Tuberculosis association created a public understanding of tuberculosis that was reflected in steadily increasing official tuberculosis control. Voluntary organizations throughout the world were similarly effective. The National Tuberculosis association is financed by the sale of Christmas seals, a device originated in Denmark in 1903 by Einar Holbøll. By mid-20th century the association, made up of about 3,000 co-ordinated state, county and city units, was raising more than $20,000,000 annually by this means.

Local official tuberculosis control at the state level was practised in the U.S. long before a federal division for tuberculosis was organized. Many states developed strong programs with clinics, case-finding programs and state hospitals. In 1944 a tuberculosis control division was established in the bureau of state services of the U.S. public health service to aid state health departments in developing adequate programs, and to bring about other "measures for the prevention, treatment and control of tuberculosis." In Great Britain national law requires that local county and borough authorities have a tuberculosis scheme. In the general plan the tuberculosis dispensary is the central unit. Coordinated with the dispensary, which is organized to serve a community population of 150,000 to 200,000 persons, are a series of institutions, including hospitals for special types of tuberculosis, training colonies and village settlements. On the staff of each county council and county borough council are tuberculosis officers, charged with operation of the tuberculosis scheme. The system of control was improved markedly during World War II, after an alarming rise in the incidence of the disease in early years of the conflict. On recommendation of the medical research council a program was adopted calling for mass radiography of civilians for case-finding purposes, energetic follow-up of home contacts of tuberculous patients, financial assistance for patients undergoing treatment, increased measures for after-care and rehabilitation following sanatorium treatment, and, finally, nation-wide extension of the program of pasteurization of milk.

Sanatoria, in the notable decline of tuberculosis, played a highly effective role, not only in providing medical care, but in isolating tuberculous patients who would otherwise be sources of infection. In the early years of the 20th century most of the sanatoria in the U.S. were private; by mid-century the great majority of such institutions were under state, county or municipal control, and of hospital rather than sanatorium character. In 1900 there were only 4,500 beds for tuberculous patients in the U.S.; by 1940 there were approximately 100,000. The provision of beds for tuberculosis in the proportion of two and a half for every death annually from the disease, was a recognized requirement of public-health practice.

With improved understanding of the means for combating tuberculosis, progressive health departments, ably assisted by voluntary agencies, incorporated extensive case-finding programs in their general procedure for tuberculosis control. Two methods came into use. In the older, an effort is made to ensure examination of all persons in the same household or in close association with a person known to have tuberculosis. This is based on the fact that tuberculosis is contagious, and the persons most likely to become tuberculous are those in intimate contact with the disease. In the later method large groups or whole communities are X-rayed by one of several inexpensive and rapid methods. In World War II, mass X-ray examination was used on an enormous scale to detect cases of tuberculosis in prospective recruits and draftees.

In determining the prevalence of tuberculosis in a population, tuberculin is an important agent. Any person infected with tuberculosis develops a specific inflammatory reaction when tuberculin is injected into the skin or placed in prolonged contact with the skin in an ointment. Actually only a fraction of those infected develop the disease, but possible future cases are thus recognized, and when large groups are examined the results furnish a measure of the extent of infection in a community. In guarding the health of previously uninfected persons exposed to the disease, such as members of the household of a tuberculous patient or nurses caring for patients in a hospital, the tuberculin test furnishes the earliest evidence of infection.

...t of an adequate program of tuberculosis con-
...tion of human infection by bovine-type bacilli
...untries with continuing measures for the eradica-
...culosis in cattle and universal pasteurization of milk,
...berculosis of bovine origin became rare, but in countries
...t such measures, bovine-type bacillus infection of children
...still frequent.

Preventive inoculation against tuberculosis, in which live but attenuated tubercle bacilli are used as a vaccine, was introduced in France in 1921 by Albert Calmette and Camille Guérin. The strain designated BCG (Bacillus-Calmette Guérin) was one of bovine origin, which became attenuated while growing on culture media containing bile. After its introduction by Calmette, large numbers of children were vaccinated in France, central Europe and the Balkans. The method was adopted in the Scandinavian countries and South America and after 1930 the vaccine was used there on an extensive scale. The procedure met with little favour in the U.S. until after 1940, when studies by J. D. Aronson and C. E. Palmer and S. R. Rosenthal were accepted as indicating definite value. In the meantime its use had become compulsory in exposed groups in Denmark, Norway and Sweden.

Rehabilitation of Tuberculous Patients.—When patients return to normal life after arrest of their disease in a tuberculosis hospital, relapse frequently occurs. Other patients never achieve a true arrest of the disease, but develop a tolerance so that they can undertake a certain amount of activity without symptoms or acceleration of the progression of their disease. A sheltered post-hospital environment, where work can be carried out under medical supervision and gradually increased until normal activity can be resumed safely, is as important for many patients as hospital care. Likewise, for those who cannot arrest their disease and who may be a menace to society because of the persistence of tubercle bacilli in their sputum, but who retain the capacity for some degree of productive work, it is desirable to have an environment as nearly satisfactory as possible, with the medical supervision necessary to guard against undue strain and maintain proper facilities for medical treatment when it is needed. The need in each respect was met by an increasing number of organizations for vocational training, part-time employment and custodial care with graded activity. The Altro workshops in New York city, manufacturing washable garments, and the Potts Memorial institute in Livingston, N.Y., with a successful print shop, became examples of sheltered workshops in which convalescing tuberculous patients could work within the limits of their strength and gradually increase their capacity for employment. The Papworth Village settlement near Cambridge, Eng., achieved world-wide fame for its provision of suitable living and working conditions and medical care for patients for whom cure could not be expected. This settlement established quarters for single persons and families, and provided for a wide variety of occupations. In such a colony a patient with chronic tuberculosis, without toxic manifestations and able to do a limited amount of work, could approach closely to a normal existence.

Tuberculosis in Animals, Birds, Fish and Reptiles.—Tuberculosis is occasionally encountered in wild animals and birds in their native state; it is much more frequent when they are in captivity. Presumably the greater exposure and opportunity for infection in captivity account for the difference. Among domestic animals and birds, tuberculosis is an important disease in cattle, swine and domestic fowl. Cattle are infected by the bovine type of bacillus and relatively infrequently by the avian, swine frequently by both and occasionally by the human type, and domestic fowl only by avian bacilli.

In cattle the mesenteric and other lymph nodes and the liver, spleen, serous cavities and other organs are involved; tuberculosis of the udder is frequent and is serious because it leads to heavy contamination of milk with tubercle bacilli. In the U.S. bovine tuberculosis by mid-20th century was a vanishing disease. Less than 0.5% of the nation's herds included reactors to tuberculin. The slaughter of infected cattle, detected by the tuberculin reaction, had become a universally accepted procedure, and the avoidance of tuberculous infection from dairy products was made doubly sure by the general pasteurization of milk. In the British Isles and much of the rest of the world, however, bovine tuberculosis was still a common disease responsible for widespread infection of children. In Great Britain Frederick Heaf estimated in 1947, that 1,600 deaths resulted annually from drinking tuberculous milk, that 40% of the country's cattle reacted to tuberculin and that 0.5% of the dairy cattle yielded milk containing tubercle bacilli. Vigorous promotion of the campaign to pasteurize milk was under way, however. Adequate programs of control on the model of that practised in the U.S., including slaughter of infected cattle and pasteurization of milk, were expensive and still to be developed in most parts of the world.

The control of tuberculosis in swine had not been so successful as in cattle. Cattle infect each other, as do humans, and in both species removal of sources of infection halts the spread of disease. Swine, however, are susceptible to avian-type tubercle-bacillus infection, as well as bovine. It is difficult to keep swine and poultry entirely separate, and birds other than domestic poultry are likely to establish sources of infection. Tuberculosis in domestic poultry is also difficult to control. Intestinal ulceration is the rule, and droppings may be heavily contaminated. The most practical procedure is to market birds at an early age and thereby limit opportunities for infection. Claims that the avian tubercle bacillus occasionally infects man have been made, but the evidence has not been convincing. Avian tuberculosis is a source of serious economic loss, but is not, like bovine tuberculosis, a significant source of human disease.

TUBEROSE. The cultivated tuberose (*Polianthes tuberosa*) of the family Amaryllidaceae is a plant distantly allied to the American agaves, but has not been found wild. The tuberose rootstock sends up a stem 3 ft. in height, with numerous lanceolate leaves and terminal racemes of waxy white, funnel-shaped, very fragrant flowers. Each flower is about 1¾ in. long, with a long tube and a six-parted limb. The ovary is three-celled, and the ovoid fruit is crowned by the persistent flower. The plant is largely grown in the United States and at the Cape of Good Hope for export to England, as it is found that imported tubers succeed better than those grown in the United Kingdom. The double-flowered form is that principally grown.

TÜBINGEN, a town of Germany, in the *Land* of Württemberg, on the banks of the Neckar, at its junction with the Ammer and Steinlach, 22 mi. S of Stuttgart by road. Pop. (1939) 32,002. Tübingen is mentioned as a strong fortress in 1078, and was ruled from 1248 by counts palatine. In 1342 it was purchased by the count of Wurttemberg, whose descendants afterward acquired the title of duke.

The town was captured by the Swabian league in 1519, by Turenne in 1647, and again in 1688 by the French, who destroyed the walls.

The most conspicuous building is the old ducal castle of Hohentübingen, built in 1507–35 on a hill overlooking the town, and now containing the university library and the observatory. The quaint old *Stiftskirche* (1469–83) is a Gothic building containing the tombs of the rulers of Württemberg; the town-hall dates from 1435 and was restored in 1872. Tübingen's chief claim to attention lies in its famous university, founded in 1477 by Duke Eberhard of Württemberg. Melanchthon was a lecturer here (1512–18). The university adopted the reformed faith in 1534, but in 1817 a Roman Catholic theological faculty was added to the other faculties. The leading faculty was long that of theology. The university was attended in 1937 by about 1,500 students and had a teaching staff of 200. In the neighbourhood is the former Cistercian monastery of Bebenhausen, founded in 1185.

TUBUAI (or AUSTRAL) ISLANDS: *see* PACIFIC ISLANDS

TUBULIDENTATA, an order of mammals, including only the African aardvarks (*q.v.*), and formerly united with the Xenarthra and Pholidota (*q.v.*) as the order Edentata, under which heading these groups are treated.

TUBUPHONE, a musical instrument resembling the Glockenspiel (*q.v.*), with metal tubes replacing the steel bars of the latter.

TUCKER, ABRAHAM (1705–1774), English moralist, was born in London, of a Somerset family, on Sept. 2, 1705, son of a wealthy city merchant. He studied at Merton college, Oxford, and in 1727 settled down as a country gentleman at Betchworth castle, near Dorking. His chief work was *The Light of Nature Pursued* (7 vols. 1,765 pp.), which was completed but not all of it published when he died on the 20th of November, 1774.

In some important points Tucker anticipates the utilitarianism afterwards systematized by Paley. "Every man's own satisfaction" Tucker holds to be the ultimate end of action; and satisfaction or pleasure is one and the same in kind, however much it may vary in degree. This universal motive is further connected, as by Paley, through the will of God, with the "general good, the root where out all our rules of conduct and sentiments of honour are to branch."

The *Light of Nature* was republished with a biographical sketch by Tucker's grandson, Sir H. P. St. John Mildmay (1805), 7 vols. (other editions 1834, 1836, etc.), and an abridged edition by W. Hazlitt appeared in 1807. *See* James Mackintosh, *Dissertation on the Progress of Ethical Philosophy* (Edinburgh, 1832); and specially Sir Leslie Stephen, *English Thought in the 18th Century*, iii, 119–130.

TUCSON, a city in southeastern Arizona, U.S., lying in the broad valley of the Santa Cruz river. It is about 2,400 ft above sea level and is sheltered by mountains 5,000–9,000 ft. high. The population in 1950 was 45,064 (corporate limits only and not including semitransient visitors). Tucson has many irrigated farms in its vicinity and is the centre of one of the oldest agricultural districts of the state. Its climate is dry, mild and equable and attracts many winter visitors. It is an industrial and transportation centre, on the main line of the Southern Pacific railway, and is also the northern terminus of the Southern Pacific of Mexico railway, which gives direct service to Guadalajara and Mexico City.

It is also on the main line of the American Airlines and Frontier Air Lines. The Southern Pacific has its division headquarters and repair shops in the city.

The University of Arizona (1885; nonsectarian, coeducational) occupies a campus of 75 ac. in the northeastern part of the city. Its attendance increased from 201 in 1909 to 6,000 in the winter of 1950–51.

Connected with the university is the state museum, which houses extensive archaeological and natural history collections. At Tucson is also the southwest experiment station of the U.S. bureau of mines.

In 1900 Tucson became the see of the Roman Catholic bishop and the church maintains a cathedral, St. Joseph's Academy and San Xavier Mission for Indians.

The city has an excellent Carnegie library.

In the immediate vicinity lie ruined villages of the ancient Pueblo peoples. In history Tucson is first heard of in 1699 as an Indian rancheria or settlement. In 1763 it was a *visita* of the Jesuit mission of San Xavier del Bac, founded between 1720 and 1732, 9 mi. south of Tucson. It was made a presidio or military outpost in 1776, and, although a few Spaniards may have lived there before, the founding of Tucson as a Spanish town dates from this time. It was never afterward abandoned during the Indian Wars. The first decade of the 19th century was the apex of its prosperity under Spanish rule, and its population was between 2,000 and 3,000 people. By 1848 this number had dwindled to 760. Tucson lay within the territory acquired by the United States by the Gadsen Purchase in 1853. It was occupied by the United States in 1856, and with the arrival of American troops and traders a new era of prosperity began. In the '60s and '70s the place witnessed considerable commercial activity, it being a general pack-train centre. In 1860 the *Weekly Arizonian*, the first newspaper in the state, was established there. Fort Lowell, 7 mi. northeast of the city, was built in 1873 for protection against the Apache Indians; it was abandoned in 1891. Tucson was occupied by the Confederates in Feb. 1862, and by the Union forces in May. It was the territorial capital from 1867 to 1877. The Southern Pacific railway arrived from the west in 1880, and in 1910 the connection with the Mexican railways was made.

Tucson was chartered as a city in 1883.

TUCUMÁN, a northern province of Argentina, bounded N. by Salta, E. by Santiago del Estero, S. and W. by Catamarca. Area, 8,696 sq.mi. Pop. (1914 census), 332,933; 1947 estimate, 587,604.

The Sierra de Aconquija is on the western frontier of the province and there is also broken country in the north, but in the east the country is flat, alluvial and very fertile. The only large river is the Salí, a tributary of the Río Dulce, which receives a large number of small streams from the Sierra de Aconquija and flows through Santiago del Estero to the Mar Chiquita in Córdoba.

Tucumán's main industry is the production of sugar and alcohol. Other products include rice, corn and livestock.

The capital of the province is Tucumán (*q.v.*).

TUCUMÁN OF SAN MIGUEL DE TUCUMÁN, a city of Argentina, capital of the province of Tucumán, on the right bank of the Salí river, 718 mi by rail N.W of Buenos Aires, in lat. 20° 50′ S., long. 65° 15′ W. Pop. (1947 est.) 170,000. The climate is warm. A summer maximum of 104° F. has been recorded, and frosts occur in occasional winters. The rainfall, which occurs almost wholly between September and April is moderate, about 38 in. per year.

Tucumán is laid out in regular squares, and retains many of its old characteristics, low buildings enclosing large courts (patios), with large rooms, thick walls and tile roofs. Several railway lines provide direct communication to Buenos Aires and other parts of Argentina.

Tucumán was founded in 1565 by Diego Villarroel at the confluence of the Salí and Monteros rivers, but frequent inundations led to a removal to its present site in 1585. In 1680 it succeeded Santiago del Estero as the capital of the province of Tucumán, then under the government of the Spanish viceroy at Lima. The province of Tucumán then extended from Jujuy south to Córdoba. In 1776 the viceroyalty of La Plata was created and Tucumán was transferred to its jurisdiction. In 1816 a convention of delegates from the La Plata provinces met in Tucumán and signed (July 9) an act of independence, which formally dissolved all ties with the mother country.

TUDELA, a town of northern Spain, in the province of Navarre, on the Saragossa-Logroño and Tudela-Tarazona railways, and on the right bank of the river Ebro, which is here joined by its tributary the Queiles. Pop. (1940), 12,873 (mun., 13,134). Tudela, the Roman *Tutela*, was taken from the Moors by Alphonso I of Aragon in 1114

The town was an episcopal see from 1783 to 1851. The

Ebro is here crossed by an ancient bridge of 19 arches. The Romanesque collegiate church, Santa Maria, founded in 1135 and consecrated in 1188, is one of the most perfect in northern Spain. There are many sawmills in the town, and an active timber trade.

TUDOR (FAMILY). The house of Tudor, which gave five sovereigns to England, is derived by all the Welsh genealogists from Ednyfed Vychan of Tregarneedd in Anglesey, who is named in 1232 as steward of Llywelyn, prince of North Wales, and, seven years later, as an arbitrator in a convention to which Davydd, the son of Llywelyn, was a party. His descendant, Tudor Vychan ap Gronw of Trecastell, had four sons, of whom the eldest, Gronw Vychan, was in favour with the Black Prince and with Richard II. He was forester of Snowdon and steward of the bishop of Bangor's lordship in Anglesey. He died in 1382, an infant son being heir to his lands in Penmynydd, whose sister carried them to her husband Gwylym ap Gmffydd of Penrhyn

Gronw's brothers Gwylym and Rhys served Richard II. as captains of archers. Their youngest brother, Meredydd ap Tudor, escheator of Anglesey in 1392 and, like Gronw, an officer of the household of the bishop of Bangor, is said to have slain a man and fled to the wild country about Snowdon. He was the father of the handsome Owen ap Meredydd, commonly called Owen Tudor, a squire who appeared at the court of the infant king Henry VI, and attracted the admiration of the queen mother. About 1428 or 1429, it must have been common knowledge that Owen Tudor and Queen Catherine were living as man and wife. There is no direct evidence for their marriage. An act had but lately been passed for making it a grave offence to marry with the queen dowager without the royal consent: this act is said to have been afterwards cut out from the statute book. Richard III denounced his rival Richmond as the son of a bastard, but it must be remembered that Richard was ready to foul the memory of his own mother in order to say the same of the young Edward V. But no one yet has found time or place of Owen Tudor's marriage with Catherine of France.

Five children were born to them, the sons being Edmund and Jasper and another son who became a monk. In 1436, a date which suggests that Bedford had been Owen's protector, the influence of Gloucester was uppermost. In that year the queen dowager was received within Bermondsey Abbey, where she died in the following January. Her children were taken from her, and Owen Tudor "the which dwelled with the said queen" was ordered to come into the king's presence. He had already seen the inside of Newgate gaol, and he would not obey without a safe conduct. When he had the safe conduct sent him he came up from Daventry and went at once to sanctuary at Westminster, whence even the temptations of the tavern would not draw him. Allowed to go back to Wales, he was retaken and lodged again in Newgate. He broke prison again and returned to his native Wales. When Henry VI. came of full age he made some provision for his stepfather, who fought on the Lancastrian side. At Mortimer's Cross (Feb. 4, 1461) Owen fell into the hands of the Yorkists, who beheaded him in Hereford market place.

His eldest son, Edmund of Hadham (b. *c.* 1430), was knighted in 1449, and in 1453 he was summoned as earl of Richmond. He was declared of legitimate birth, and in 1455 he married Lady Margaret, daughter of John Beaufort, duke of Somerset. His only child, afterwards Henry VII., was born three months after his death.

Edmund's younger brother, Jasper Tudor, survived him many years. Jasper was knighted in 1449 and, about the date of Edmund's patent, was created earl of Pembroke. He bore the royal arms of France and England, differenced with a blue border charged with the royal martlets of the Confessor's fabulous shield, and the same was formerly to be seen upon his Garter stall-plate of 1459. He fought at St. Albans in 1455 for the king who had advanced him, and two years later we find him strengthening the defences of Tenby. In 1460 he seized Denbigh, where the queen joined him after Northampton. He shared the defeat at Mortimer's Cross and left the country in 1462. In 1465 he made a last descent upon Wales, to be driven off by William Herbert, who was rewarded with his earldom of Pembroke, already forfeited by attainder. He came back again with Warwick in 1470 and was hurrying to join the queen when Tewkesbury was fought and lost. After many adventures he carried off his young nephew Richmond to Brittany The two came back together in 1485. After Bosworth, Jasper was created duke of Bedford and restored to his earldom, the earl-marshalship being given him in 1492. He lived to fight at Stoke in 1487 against Lincoln and Simnel his puppet and to be one of the leaders of the host that landed in France in 1492. He died in 1495 leaving no issue by his wife Catherine, the widow of the second duke of Buckingham and a daughter of Richard Widvile, Earl Rivers. But his bastard daughter Ellen is said to have been mother of Stephen Gardiner, bishop of Winchester.

TUDOR PERIOD, in architecture and the decorative arts, a loose term covering the final phase of Perpendicular Gothic and the earlier phases of Elizabethan or even Jacobean work, from which it is usually differentiated by the fact that those examples in which the Gothic influence predominates are termed Tudor, while those in which classic influence is more noticeable are known as Elizabethan or Jacobean. Since the Gothic tradition persisted in various parts of England and especially in Oxford and Cambridge until late in the 17th century, it is difficult to assign date limits to the Tudor style. In ecclesiastical architecture the Tudor period saw the climax of Perpendicular development. (*See* PERPENDICULAR PERIOD.) The characteristics in exterior secular work are: large groups of rectangular windows; rich oriel or bay windows; interesting and sometimes fantastic chimney treatments; complex roofs with many gables; much brickwork, frequently in patterns and lavish half-timber (*q.v.*). In interior secular work this period saw an extraordinary development of wood panelling which was frequently used to cover all four sides of a room, and often enriched with linen fold (*q.v.*) decoration and occasional naïve travesties of classic forms and the lavish use of moulded plaster-work for ceilings, cornices and walls. Examples of the style are: the older portions of Hampton Court palace (1515–25); Layer Marney (1522–25); Moreton Old Hall, Cheshire (1550); Compton Wnyates (*c.* 1520), Burton Agnes (1602–10); Ford's hospital, Coventry (begun 1529), at Oxford, Corpus Christi college (1516), the Founder's tower (1492–1505) and the hall (1541) at Magdalen, the tower of the old examination schools (*c.* 1620) and the chapel of Oriel (1637); at Cambridge, Queens' college (*c.* 1450), the two earliest courts of S. John's (between 1511 and 1602), and the King's gateway and Great Court at Trinity (built between 1518 and 1605). (T. F. H.)

TUFF (Ital. *tufo*), a rock formed by induration of volcanic ash or dust. The loose fragmental ejecta of volcanoes are classified by size into (1) volcanic dust, less than 0.5 mm.; (2) ash, from 0.5 mm. to 4 mm.; (3) lapilli, from 4 mm. to 32 mm.; (4) bombs and blocks, larger than 32 mm. Bombs are plastic while blocks are solid when erupted. By compaction and cementation, volcanic dust yields dust tuff and ash yields tuff. If lapilli predominate over the finer constituents, a lapilli tuff results Rocks composed chiefly of bombs are termed agglomerates and those consisting mainly of angular blocks are classed as volcanic breccias.

Among the products of explosive eruptions, some form by expulsion of liquid magma as clots and spray. These are referred to as essential or juvenile ejecta. Other fragments are discharged in a solid state, being torn from the crater walls, from the tops of cones or the roofs of the underlying reservoirs. These are termed accessory ejecta. Still other ejecta are described as accidental, since they include pieces of any kind of rock torn from the subvolcanic basement. Many of these are intensely baked or wholly recrystallized, such as the limestone blocks periodically blown out by Vesuvius. Indeed the pipes of many extinct volcanoes are almost completely filled with accidental debris made up of comminuted sandstone and shale, as in the Navajo region of New Mexico. It is the violent expansion of water vapour released from deep-seated bodies of magma that blasts these pipes through the overlying formations.

Tuffs may also be grouped as vitric, crystal or lithic, according as they are composed principally of glass, crystal chips or the debris of pre-existing rocks. During some explosions, like that of Krakatoa in 1883, the ejecta consist mainly of pumice (that

is, of extremely porous, glassy fragments light enough to float on water) and of finely divided glass dust that may be drifted by winds around the world. Volcanoes fed by siliceous magma, such as rhyolite, dacite and trachyte, tend to produce the most voluminous and extensive deposits of this kind. However, some of the world's largest deposits of vitric tuff are produced by eruptions through a large number of narrow fissures rather than from volcanic cones. Foaming magma wells to the surface as an emulsion of hot gases and incandescent particles, and the material spreads swiftly even over gentle gradients as glowing avalanches. Such eruptions occurred in 1912 in the Valley of Ten Thousand Smokes, Alaska. After coming to rest, the ejecta may be firmly compacted by adhesion of the hot glass fragments, and so form streaky, welded tuffs like those covering vast areas in New Zealand, Guatemala, Peru and Yellowstone National park, U.S.

Even fluid basaltic magma, such as that of Kilauea and Mauna Loa, may be inflated by expanding gas and tossed out as delicate glass threads and blebs, known respectively as Pele's hair and Pele's tears. But the chief fragmental products of basaltic volcanoes are the dark, porous, glassy lapilli and bombs which, from their superficial resemblance to the residues of burning coal, are spoken of as cinders. If the lapilli and bombs are sufficiently plastic when discharged, they assume rounded and ropy forms, partly in response to rotation during flight. More viscous clots fall to earth as subangular lumps with cracked, glassy skins that resemble bread crusts.

During other eruptions, the volume of ejected crystals exceeds that of glassy material, as at La Soufrière, West Indies, in 1902. Light crystals of leucite may accumulate by flotation close to the top of the conduit of Vesuvius during intervals of quiet, to be hurled out when activity revives; or clusters of heavy olivine and augite crystals may be expelled from lower levels. If the temperature of eruption is low, the explosions simulate steam blasts and none but angular, lithic fragments of old rock are expelled, as at Bandai-san, Japan, in 1888.

Fine ash and dust may aggregate into pellets or mud balls by falling through an eruption-cloud in which water vapour is condensing. Somewhat similar accretionary lapilli develop by the action of rain and wind on newly fallen ash.

In response to the dictates of gravity, the coarser and heavier volcanic ejecta tend to fall close to the source, while the finer and lighter particles are carried afar. Hence, in extensive deposits, tuff may vary greatly not only in texture but also in chemical and mineralogical composition. The ejecta of Quizapu, Chile, in 1932, provide an excellent illustration.

Some ejecta fall directly into lakes or into the sea; others, having been deposited on land, are later washed into bodies of water and are there mixed with normal sediment. The ashy clays and sands thus produced may subsequently be converted to tuffaceous shales and sandstones. When explosions take place underground, by contact of lava with ground water or wet sediments, the fragmental material may be forced violently into the surrounding rocks, forming instrusive tuffs or peperites.

There has probably been no geological period entirely free from volcanic eruptions. Tuffs therefore range in age from Archaean to Recent. Usually, the older ones have lost all original textures and are thoroughly recrystallized. Many old basaltic tuffs are now represented by green chlorite and hornblende schists, and many rhyolitic tuffs by sericite schists.

From A.D. 1500, the world's volcanoes have discharged about 80 cu.mi. of fragmental ejecta, as against 16 cu mi. of lava. The most voluminous explosions are generally associated with gas-rich magmas of volcanoes in mountain belts on the continents and adjacent islands, and follow long periods of quiescence. Among the most violent explosions of recent times are those of Tamboro, East Indies, in 1815; Coseguina, Nicaragua, in 1835; Krakatoa, Netherlands Indies, in 1883; and Katmai, Alaska, in 1912. Respectively, these volcanoes erupted approximately 8, 12, 5 and 6 cu.mi. of fragmental material. (H. Ws.)

TU FU (杜甫, A.D. 713–770), a Chinese poet and painter of the T'ang dynasty, considered by some Chinese critics as the supreme poet. Tu Fu was born in Tu Ling in the Shensi province, and is therefore often called Tu Shao-Ling (杜少陵), although his father was a native of Hsiangyang in Hupeh. His family belonged to the military and literary class. At 15, his essays and fantastic verses won great admiration. After ten years of wandering, he went to the capital, Changan (長安), for his literary examinations. Although his written papers were excellent he was not given a degree, as his views were unorthodox. He then became a wanderer, and on the "Lute Terrace" in Ching Hsien, he met his much admired friend Li Po, whom he immortalized in verse

In 749 the emperor (玄宗) invited all great scholars for examination. Tu Fu presented himself, but waited for four years until he managed to please the emperor with his three great *fu* (三大禮賦, a prose poem of irregular lines). He was given a post in the Chih Hsien library which he held for four years, he was then promoted to another post at Fêng-hsien. In 758, when the rebellion of An Lu-Shan (安祿山), which drove the emperor Ming Huang from the throne, broke out, he was exiled and went to live with a relative at White Water village (鄜州).

When a new emperor ascended the Dragon throne, Tu Fu went to pay his respects to him, but on the way he was captured by brigands, beaten, and made prisoner for a year. He escaped, and, emaciated and clad in rags, he reached the emperor. He was appointed to the post of censor, but fell into disgrace and was delegated to a minor post as governor of a small town in Shensi. This position he did not accept, and joined his family at Kansu. They were struggling for existence, and the poet supported them by digging up roots for food and by selling firewood. Several of his children, however, died of hunger. After six months in office in Hua Chou, he retired to Chêngtu in Szechwan, living in a house of grass roots. Here he wrote some of his most beautiful lyrics.

In 768 he took up nomadic life once more. He was caught by floods and compelled to go into a ruined temple at Hu Huang without food. After ten days' starvation he was given a feast by the local officials, and died (770) of over-eating.

(Y. K.)

TUGELA, the largest river in Natal, its basin being about 8,000 sq.m. in extent. It rises on Mont aux Sources, in the Drakensberg, at over 10,000 ft. above sea-level. After a mile or two it plunges over the great escarpment forming the most rugged and picturesque scenery, and then flows as a dignified stream in a broad, open valley to a point a few miles below Colenso, about 60 m. eastward from the source. Here the valley becomes steeper and narrower, owing to rejuvenation. This character persists until within a few miles of its mouth, the river being sometimes 2,000 ft. below the neighbouring plateau. The Tugela is quite unnavigable. Its volume has great seasonal fluctuations, being easily fordable in many places in winter, and often quite impassable during summer rains. The Tugela receives as tributaries on its right bank the Little Tugela, rising near Cathkin Peak, and the Bushman and Mooi rivers, which both originate near Giant's castle. On its left bank it receives the Klip river, which flows past Ladysmith, the Sunday's river from the Biggarsberg, and the Buffalo river, which rises near Majuba and flows not far from Isandhlwana, at which place, and also at Rorke's Drift, on the Buffalo, memorable actions were fought in the Zulu War. The boundary between Natal proper and Zululand follows the Tugela from its mouth to the confluence with the Buffalo river, and then runs up the latter to its junction with the Blood river, so called on account of the defeat of Dingaan's impi by the Boers in 1838.

TUGGURT (Touggourt), capital of the region of the Wadi Ghir, Algerian Sahara, 127 mi. S. of Biskra, with which it is connected by a railway. It is the chief town of a "mixed" commune and of a territory of 284,940 inhabitants (1948). It has itself 14,719. Just within the northern of two gates is the market place and

the chief mosque. The surrounding oasis contains about 200,000 date palms. Temacine, with a holy lake, seat of a branch house of the extensive Moslem religious brotherhood of the Tijani, is nearby. From the city a road 75 mi. long leads across the desert northeast to El Wad (*q.v.*).

TUGUEGARAO, a municipality and capital of the province of Cagayan, Luzon, Philippine Islands, on the Cagayan river, about 60 mi. from its mouth, and near the southern boundary of the province. Pop. (1939) 27,643, of whom 13,862 were males and 65 were white. The river is navigable to Tuguegarao for vessels of light draught. The surrounding region is the most productive of tobacco in the archipelago. Ibanag is the principal vernacular, but Ilocano and Tagalog are also used. Of the inhabitants aged 6 to 19 inclusive, 36·6% attended school in 1939, and 58·2% of the population 10 years old and over was literate. (C. S. L.)

TUKE, the name of an English family, several generations of which were celebrated for their efforts in the cause of philanthropy.

WILLIAM TUKE (1732–1822) was born at York on March 24, 1732. His name is connected with the humane treatment of the insane, for whose care he projected in 1792 the Retreat at York, under the management of the Society of Friends, which became famous as an institution in which a bold attempt was made to manage lunatics without the excessive restraints then regarded as essential. His son HENRY TUKE (1755–1814) co-operated with his father in his reforms.

Henry's son SAMUEL TUKE (1784–1857) continued the work begun by his grandfather, and published a *Description of the Retreat near York*, etc. (York, 1813). He also published *Practical Hints on the Construction and Economy of Pauper Lunatic Asylums* (1815). He died at York on Oct. 14, 1857.

Samuel's son JAMES HACK TUKE (1819–1896) is chiefly remembered for his philanthropic work in Ireland, which resulted from a visit to Connaught in 1847, where he witnessed much distress. Letters descriptive of the state of things he saw when he was distributing relief in 1880, were published in *The Times*, and in his pamphlet, *Irish Distress and its Remedies* (1880), he pointed out that Irish distress was due to economic rather than political difficulties, and advocated state-aided land purchase, peasant proprietorship, light railways, government help for the fishing and local industries, and family emigration for the poorest peasants. From 1882 to 1884 he superintended the emigration of poor families to the United States and the Colonies. To his reports on the distribution of seed potatoes in 1885, and his letters to *The Times*, which were reprinted under the title *The Condition of Donegal* (1889), were due in a great measure the bill passed for the construction of light railways in 1889 and the Irish Land Act which established the Congested Districts Board in 1891. He died on Jan 13, 1896.

See *Report of the Select Committee of the House of Commons* (1815–16); DR. Conolly, *Treatment of the Insane without Mechanical Restraints* (1856); DR. Hack Tuke, *Chapters in the History of the Insane in the British Isles* (1882).

DANIEL HACK TUKE (1827–1895), younger brother of James Hack Tuke, abandoned a solicitor's career to undertake work at the York Retreat. After studying medicine in London, he graduated M.D. at Heidelberg in 1853. In 1858, in collaboration with J. C. Bucknill, he published a *Manual of Psychological Medicine*, which was for many years regarded as a standard work on lunacy. In 1853 he visited a number of foreign asylums, and later returning to York he became visiting physician to the York Retreat and the York Dispensary. In 1859 he retired, but he resumed practice in London in 1875 as a specialist in mental diseases. In 1880 he became joint editor of the *Journal of Mental Science*. He died on March 5, 1895.

Among his works were *Illustrations of the Influence of the Mind on the Body* (1872); *Insanity in Ancient and Modern Life* (1878); *History of the Insane in the British Isles* (1882); *Sleepwalking and Hypnotism* (1884); *Past and Present Provision for the Insane Poor in Yorkshire* (1889); *Dictionary of Psychological Medicine* (1892).

TUKHACHEVSKY, MIKHAIL NICOLAEVICH (1893–1937), Russian soldier, was born in the government of Smolensk. He was educated in the corps of cadets and the Alexandrovsky military school, out of which he passed in July 1914. In Feb. 1915 he was taken prisoner by the Germans, but escaped back to Russia in 1917, and in June 1918 received the command of an army. He commanded successively the I., VIII. and V Armies and then the Caucasian front. After the successful conclusion of operations against Denikin, Tukhachevsky was given the command of the Western front. After the Civil War he became chief of the military academy, and in April 1924 was appointed assistant chief-of-staff. In 1936 he was one of the Soviet representatives at the funeral of King George V. On June 11, 1937, after a secret trial for espionage and high treason, he, together with seven other generals, was shot.

TUKULOR, a tall, long-headed, well-proportioned and muscular people with long faces and fine features, incorporating Serer, Wolof, Mandinga, Soninke and Fulani elements in Senegal and the French Sudan. They call themselves *Futankobe* or *Futanke;* the Wolofs call them *Tokoror* or dwellers in the Tekrur or Senegalese Futa, or Tukolor, the name adopted for them by the French. Their language resembles Fulani and is related to Wolof and Serer. The Tukulor organized a theocratic elective monarchy, with a religious chief (*Almamy*), a functionary whose office was abolished in 1881. Their present organization is by territorial groups. The Tukulor are fanatical Muslims. The people are skilled cultivators and cattle-raisers, and are very brave

See Dr. Lasnet, *Une mission au Sénégal* (1900); Delafosse, *Haut Sénégal Niger* (1912).

TULA, (1) a region of the Russian S.F.S.R., surrounded by those of Smolensk, Moscow, Ryazan and Orel, and not coinciding with the pre-1917 province of the same name. Area 12,317 sq.mi. Pop. (1939) 2,049,950 (urban 711,240; rural 1,338,710), mainly Great Russians. It consists of plateau land (950 to 1,020 ft), deeply entrenched by the Don and its tributaries, the Upa and Sosna. About 9% is forested, the northern region having coniferous trees, and the south small and scattered patches of birch, ash and oak. The south is in the steppe black earth region, where agriculture gives a good guarantee to the peasant, but the north is poorer grey forest soil. There is little good pasture and dairying is not much developed, though sheep, working and milch cattle, horses, pigs and goats are bred to some extent. The climate is extreme, with five months' winter frost, an average July temperature of 66° F and 16–18 in. of rain per annum.

The chief crops are rye (48·2%), and oats (28·3%). Buckwheat, potatoes, wheat, millet, grass, hemp and sugar beet are grown, while along the Oka in the northwest of the region, apples, cucumbers, cabbages and onions are cultivated. Peat working is not profitable and the electric stations at Aleksin and Epifan use the local coal. This is mined along the railway extending eastwards from Aleksin on the Oka through Tula to the region of Ryazan. The better agricultural conditions lessen the rôle of koustar (peasant) industries, which consist mainly of the manufacture of small metal goods, especially samovars and wooden wares.

(2) Tula is also the name of the chief town of the above region, situated in the broad but low, marshy and unhealthy valley of the Upa, in 54° 12′ N. 37° 37′ E. Pop. (1939) 272,002. Tsar Boris Godunov founded the first Russian gun factory here in 1595, and in 1632 a Dutchman, Winius, established an iron factory. The factories were rebuilt on a larger scale in 1705 and 1714 and towards the end of the 18th century a marked expansion of the industry took place. The making of rifles is still the main occupation of the town, other industries being the manufacture of samovars (tea urns), sugar refining, smelting, the making of cutlery, leather and sewn goods and flour-milling. The town is first mentioned in 1147, but its former site seems to have been higher up the Tulitsa, an affluent of the Upa. Its wooden fort was replaced in 1514–21 by a stone *kreml* or citadel, which still exists.

TULARAEMIA, a specific infectious disease caused by the *Bacterium tularense*. It occurs in rabbits and squirrels throughout the West and South of the United States and causes considerable loss of life among them. In many ways it is quite similar to a plague. The first authentic human case was reported in 1913

in Utah. Since then it has become increasingly important owing to its more general recognition and also to its undoubted increase in frequency. It is transmitted to man either by an intermediate host, as the louse or flea, or by direct handling of infected animals. It usually begins as a small swollen, ulcerated spot on the skin which is followed by enlargement of the neighbouring glands. This is soon followed by a chill and a high fever which has a tendency to remit daily. There is sometimes a generalized skin rash with general involvement of the glandular system. Occasionally there is a dull typhoid state. The average course is about two weeks. The death rate is rather low but numerous fatalities have been reported. The disease is of particular importance because of its rapid spread to new territories indicating that it will probably occur more frequently in the future.

TULCEA, the capital of the department of Tulcea, Rumania, picturesquely situated on the right bank of the Danube, 42 mi. from its mouth at Sulina. Pop. (1930) 20,108, including many Russians, Turks, Greeks and Jews. A railway to Cerna Voda is projected. There is a large water-borne trade in cereals.

TULIP, a genus (*Tulipa*) of bulbous herbs belonging to the lily family (Liliaceae). The species are found wild along the northern shores of the Mediterranean, in the Levant, Armenia, Caucasus, northern Africa, Iran, and sporadically across north and central Asia to Japan. The cup-shaped flowers have six regular segments in two rows, as many free stamens, and a three-celled ovary with a sessile stigma, which ripens into a leathery many-seeded capsule. The species are numerous, and are distinguished one from another by the scales of the bulb being woolly or smooth on the inner surface, by the character of the flower stalks, by the filaments being hairy or otherwise, and by other characters. Owing to the great beauty of the flowers they have long been favourites in European and American gardens, and have been crossed and recrossed till it has become almost impossible to refer the plants to their original types.

The early flowering "Van Thol" tulips, the segments of which are mostly scarlet with yellow edges, are probably derived from *T. suaveolens*, a native of the Caspian region. *T. gesneriana*, a native of Armenia and central Russia, is the origin of most of the later flowering varieties. *T. oculussolis* and *T. clusiana* are lovely species, natives of southern Europe and *T. sylvestris*, with elegant yellow flowers, is a doubtful native of England. Owing to the exertions of Russian naturalists, a large number of new species were discovered in Turkistan and introduced into Europe. Some of these are very beautiful, and render it probable that by intercrossing with the older species still further difficulties will be presented in the way of identification. These difficulties are further enhanced by the fact that, quite apart from any crossbreeding, the plants, when subjected to cultivation, vary so greatly in the course of two or three years from the original species from which they are directly descended that their parentage is scarcely recognizable. This innate power of variation has enabled the florist to obtain, and ultimately to "fix," many remarkable varieties. Millions of bulbs are cultivated in Holland for export every year; many are also grown in the Channel Islands, especially Guernsey, in the fen district of England, around Belfast, Ireland, and in the United States. Tulips were introduced into the Low Countries from Constantinople and the Levant in the 16th century; about 1637 they became the subject of an extraordinary speculation known as "tulipomania" in which prices for single roots rose to as much as 2,600 guilders. Thousands became bankrupt when the bubble burst.

Tulips, which have sprung from *Tulipa gesneriana*, are arranged in separate classes. Of these the most important are early, breeder, cottage and Darwin tulips. There are, in addition, various secondary groups, named bizarres, byblomens, parrots, Rembrandts and striped tulips, according to their colour and marking. Tulips are readily raised from seeds, and the seedlings when they first flower (after about 7 years' cultivation) are of one colour—that is, they are self-coloured. Judged by the florists' rules, they are either good or bad in form, and pure or stained (white or yellow) at the base; the badly formed and stained flowers are thrown away, while the good and pure are grown on, these being known as "breeder" tulips.

The breeder bulbs and their offsets may grow on for years producing only self-coloured flowers, but after a time, which is varied and indefinite, some of the progeny "break," that is, produce flowers with the variegation which is so much prized. The flower is then said to be "rectified"; it is a *bizarre* when it has a yellow ground marked with purple or red, a *byblomen* when it has a white ground marked with violet or purple, or a *rose* when it has a white ground marked with rose colour.

Tulips flourish in any good garden soil that has been deeply dug or trenched and manured the previous season. To secure perfect drainage and greater warmth a fair quantity of sand or grit should be present. Fresh manure should be avoided, but the remains from an old hotbed or mushroom bed may be incorporated. The best time to plant is in October and November, the bulbs being buried about 4–5 in. deep and somewhat farther apart. The best effects are produced in formal beds by planting the same variety in each, to insure the plants being of the same height and in flower simultaneously.

Propagation.—Tulips are usually increased by offsets, which most varieties produce in fairly large numbers. These are taken off and sown in drills, like seed. They are usually strong enough to flower the third year from this sowing. Some varieties produce offsets sparingly and must be increased by seed—a slow and uncertain method. New varieties are raised from seed. (The colour variation in the flowers of seedlings is discussed above.) Seeds are sown in boxes or cold frames, in light sandy soil, and the young plants are allowed to remain undisturbed until the second year. They are then lifted and treated like offsets, being sown thinly in beds out of doors. They usually flower in about the seventh year. The soil in which tulips are propagated should be sandy, free working and thoroughly drained. A warm sheltered position is a necessity.

Forcing.—The early flowering varieties should be potted as early in September as practicable, later batches for succession being potted during October. Pots 5 and 6 in. in diameter are the most convenient for the early-flowering kinds, but seven-inch pots give the better results for the "Darwin" section of the May-flowering kinds which are now used for gentle forcing. Five or six bulbs are put in each pot and the tops should be covered with half an inch of soil and half an inch left for water. The soil should be a light and fairly rich compost, comprising about 2 parts loam, 1 part decayed manure or horse droppings that have been thoroughly sweetened, 1 part leaf mould and half a part of sand. Pot firmly, and plunge the pots in several inches of ashes out of doors, to protect the bulbs from frost, but it must be remembered that all garden tulips require a thorough winter chilling to bloom the next spring. As soon as growth commences at the top and a fair amount of roots are formed they may be introduced into the cool greenhouse, in batches according to the need and amount of stock available.

For market a slightly different method is adopted. The bulbs are placed in long shallow boxes, plunged in soil or ashes in semi-darkness, and are afterwards transferred to benches in the forcing houses where they flower. Bulbs which have been forced are of no further value for that particular purpose. If planted in borders and shrubberies, however, they will continue to bear fairly good blossoms in the open air for several seasons.

Varieties.—Many thousands of varieties are offered by dealers. The most generally useful fall into the following groups:

Early Single (or *Double*) *Flowering Kinds* are the most useful for bedding and pot culture.

Late Single Flowering Kinds.—These are all tall-growing hardy kinds suitable for growing in herbaceous borders where they can be left undisturbed; or for producing massed colour effects in flower beds. They include (a) "Cottage" or May-flowering tulips, so named because they were discovered in the gardens of old cottages, mansions, abbeys and monasteries throughout England, Scotland, Ireland, Belgium and France; (b) "Darwin" tulips which are a distinct race, having a wide range of large self-coloured flowers, but no yellows. The so-called black tulip belongs here.

Parrot Tulips.—This late flowering group is supposed to be derived from the curious green and yellow striped *T. viridiflora*. The flowers are mostly heavy and drooping, petals brightly coloured, the edges being curiously notched and wavy.

TULIPTREE (*Liriodendron tulipifera*), a North American forest tree closely allied to the magnolia (*q.v.*), called also yellow-poplar and whitewood, native from Rhode Island and Vermont west to Michigan and south to Florida and Louisiana. It is one of the handsomest trees of eastern North America, with a straight trunk sometimes 190 ft. high and 10 ft. in diameter, deeply furrowed bark, and large smooth two- to four-lobed leaves, truncate or broadly notched at the apex. The conspicuous tulip-like flowers, about 2 in. deep, yellowish-green on the outside and orange-coloured within, are followed by dry cone-shaped clusters of terminally winged samaras. At maturity these disintegrate and reveal the supporting, erect, now-naked axis which often persists on the branchlets through the winter. From Virginia to the lower Ohio valley and southward, where the tuliptree attains its maximum size and abundance, it is a valuable timber tree, furnishing the light, fine-grained lumber known as yellowpoplar, white-wood or tulipwood. In 1940 the total cut of yellowpoplar lumber in the United States amounted to 376,037,000 bd.ft. valued at the mill at about $17,000,000. The largest and oldest tuliptree in the eastern states is at Annapolis, Md.

The tuliptree is widely planted for ornament and, with protection when young, thrives in England, sometimes attaining a height of 80 ft (E. S. Hr.)

TULL, JETHRO (1674–1741), English agricultural writer and farmer, was born at Basildon, Berkshire, in 1674, probably in March. He entered St. John's college, Oxford, in 1691, and was called to the bar at Gray's Inn in 1699 but never practised. In that year he married and began farming on his father's land at Howberry, near Wallingford, and here about 1701 he invented and perfected his machine drill, and began experiments in his new system of sowing in drills or rows sufficiently wide apart to allow for tillage by plough and hoe during almost the whole period of growth. In 1709 he moved to a farm near Hungerford and from 1711 to 1714 travelled in France and Italy, making careful observations of the methods of agriculture in those countries which aided and confirmed his theories as to the true use of manure and the importance of "pulverizing" the soil. He did not publish any account of his agricultural experiments or theories until 1731, when his *Horse-hoeing Husbandry* appeared. This was followed by *Horse-hoeing Husbandry, or an Essay on the Principles of Tillage and Vegetation*, by J. T., in 1733. He was attacked in the agricultural periodical *The Practical Husbandman and Farmer* and accused of plagiarizing from earlier writers. He died on Feb. 21, 1741.

TULLAMORE, a market town and the county town of Co. Offaly, Ireland, on the Grand canal and a branch of the Great Southern railway, by which it is 58 mi. west by south of Dublin. Pop. (1946) 5,897 There is considerable trade in agricultural produce, and brewing and distilling are carried on. There are several small ruined castles in the neighbourhood, notably Shragh castle, dating from 1588.

TULLE, a town of central France, capital of the department of Corrèze, 58 mi. S.S.E. of Limoges by rail. Pop. (1946) 18,202. Tulle (*Tutela*) owed its importance in the middle ages to the abbey of St. Martin, founded in the 7th or 8th century. The abbacy was raised to the rank of bishopric in 1317. The town was taken by the English in 1346. It was again conquered by the English in 1369; but, when the inhabitants succeeded in freeing themselves, they were exempted from all imposts by Charles V. The Protestants seized Tulle in 1585. The town extends along the narrow valley of the Corrèze, its streets here and there ascending the hill-slopes on either side by means of stairways. Of its 12th century cathedral, once attached to an abbey, only the porch, nave and a tower of the 13th century, with a fine stone steeple of the 14th century, remain. The neighbouring cloister (12th and 13th centuries) has been restored. The abbot's house (15th century) has a carved doorway and well-preserved windows. Tulle is the seat of a bishop, of a prefect, of tribunals of first instance and of a chamber of commerce and a board of trade-arbitrators. Its principal industry is the manufacture of small arms, established in 1690, and now carried on by the state. There are other minor industries. The well-known cascades of Gimel formed by the Montane are near Tulle.

TULLOCH, JOHN (1823–1886), Scottish theologian, was born at Bridge of Earn, Perthshire, in 1823, and received his university education at St. Andrews and Edinburgh. In 1845 he became minister of St. Paul's, Dundee, and in 1849 of Kettins, in Strathmore, where he remained for six years. In 1854 he was appointed principal of St. Mary's college, St. Andrews. The appointment was immediately followed by the appearance of his Burnet prize essay on *Theism* (1855). At St. Andrews, where he held also the post of professor of systematic theology and apologetics, he lectured on comparative religion and treated doctrine historically, as being not a fixed product but a growth. In 1862 he was appointed one of the clerks of the General Assembly, and from that time forward he took a leading part in the councils of the Church of Scotland. In 1878 he was chosen moderator of the Assembly. He did much to widen the national Church of Scotland. He was deeply interested in the reorganization of education in Scotland, both in school and university, and acted as one of the temporary board which settled the primary school system under the Education Act of 1872. He died at Torquay on Feb. 13, 1886.

Tulloch's most important works include: *Leaders of the Reformation* (1859); *English Protestants and their Leaders* (1861); *Rational Theology and Christian Theology in the Seventeenth Century* (1872); a monograph on *Pascal* (1876); *Modern Theories in Philosophy and Religion* (1884); *Movements of Religious Thought in Britain during the Nineteenth Century* (1885). See the *Life* by Mrs Oliphant (1888).

TULLUS HOSTILIUS, third legendary king of Rome (672–640 B.C.). His successful wars with Alba, Fidenae and Veii shadow forth the earlier conquests of Latian territory and the first extension of the Roman domain beyond the walls of Rome. It was during his reign that the combat between the Horatii and Curiatii, the representatives of Rome and Alba, took place. He is said to have been struck dead by lightning as the punishment of his pride. Tullus Hostilius is simply the duplicate of Romulus. Both are brought up among shepherds, carry on war against Fidenae and Veii, double the number of citizens, organize the army, and disappear from earth in a storm. As Romulus and Numa represent the Ramnes and Tities, so, in order to complete the list of the four traditional elements of the nation, Tullus was made the representative of the Luceres, and Ancus the founder of the Plebs. The distinctive event of this reign is the destruction of Alba, which may be regarded as an historical fact. But when and by whom it was destroyed is uncertain—probably by the Latins.

See Livy 1. 22–31; Dion. Halic. iii. 1–35, Cicero, *De Republica*, ii. 17 and Roscoe, *Ancient History*.

TULSA, a city of Oklahoma, U.S., 218 mi. (by air) S. by W. of Kansas City, on the Arkansas river, county seat of Tulsa county. It is on federal highways 64, 66, 75 and 169; and is served by the Frisco, the Midland Valley, the Missouri-Kansas-Texas, the Sand Springs, the Santa Fe and the Tulsa-Sapulpa Union (electric) railways; also by American, Braniff, Continental and Central air lines. Pop. (1950) 180,586; (1940) 142,157 (84% native white and 12% Negroes) by the census. The land area is 27.3 sq.mi. The city is 800 ft. above sea level, at the meeting point of the old boundaries of the Creek, the Cherokee and the Osage nations. The old council tree of the Creeks, a large elm, was still standing at mid-20th century. A commission form of government was adopted in 1908. The water supply is brought from a reservoir in the Spavinaw hills (60 mi. E.) by force of gravity alone, though the difference in elevation of source and terminus is only 90 ft. A second flow line to the city was completed, and a second dam and lake were started in 1950 to provide water for a population of 500,000. Mohawk reservoir, a 2,100,000,000-gal. reserve, is the central feature of a park of 2,936 ac. of timbered land, with lagoons, lakes and watercourses fed by the surplus from the reservoir. The University of Tulsa, founded at Muskogee in 1894 as Henry Kendall college, was moved to Tulsa in 1907. The city's gross assessed valuation for

1950 was $172,782,588.

Tulsa is the commercial and financial capital of a rich agricultural country, and of world-wide petroleum exploration, production, refining and marketing, with 500 oil-industry companies of all types. The city is impressively clean because all industries use only natural gas as fuel.

White settlement began in 1882, when an extension of the Frisco line was completed to the Indian trading post. "Tulsey Town," as it was called then, grew slowly, reaching a population of 1,390 in 1900. It was chartered as a city in 1902. Oil developments began in 1901. In 1910 the population had increased to 18,182.

TULSĪ DĀS (*1532–1623*), the greatest and most famous of Hindī poets, was a Sarwariyā Brahman, born, according to tradition, in A.D 1532, during the reign of Humāyūn, most probably at Rājāpur in the Bāndā District south of the Jumna. His father's name was Ātmā Rām Dubé; that of his mother is said to have been Hulasī. A legend relates that, having been born under an unlucky conjunction of the stars, he was abandoned in infancy by his parents, and was adopted by a wandering *sādhū* or ascetic, with whom he visited many holy places in the length and breadth of India; and the story is in part supported by passages in his poems. He studied, apparently after having rejoined his family, at Sūkarkhēt, a place generally identified with Sōrōn in the Etah district of the United Provinces, but more probably the same as Varāhakshētra on the Gogra River, 30 m. W. of Ajōdhyā (Ayōdhyā). He married in his father's lifetime, and begot a son. His wife's name was Ratnāwalī, daughter of Dīnabandhu Pāṭhak, and his son's Tārak. The latter died at an early age, and Tulsī's wife, who was devoted to the worship of Rāma, left her husband and returned to her father's house to occupy herself with religion. Tulsī Dās followed her, and endeavoured to induce her to return to him, but in vain; she reproached him (in verses which have been preserved) with want of faith in Rāma, and so moved him that he renounced the world, and entered upon an ascetic life, much of which was spent in wandering as a preacher of the necessity of a loving faith in Rāma. He first made Ajōdhyā (the capital of Rāma and near the modern Fyzābād) his headquarters, frequently visiting distant places of pilgrimage in different parts of India. During his residence at Ajōdhyā the Lord Rāma is said to have appeared to him in a dream, and to have commanded him to write a *Rāmāyana* in the language used by the common people. He began this work in the year 1574, and had finished the third book (*Araṇya-kāṇḍ*), when differences with the Vairāgī Vaishnavas at Ajōdhyā, to whom he had attached himself, led him to migrate to Benares, where he settled at Asi-ghāt. Here he died in 1623, during the reign of the emperor Jahāngīr, at the great age of 91.

The period of his greatest activity as an author synchronized with the latter half of the reign of Akbar (1556–1605), and the first portion of that of Jahāngīr, his dated works being as follows: commencement of the *Rāmāyan*, 1574; *Rām-satsaī*, 1584; *Pārbatī-mangal*, 1586; *Rāmāyā*, 1598; *Kabitta Rāmāyan*, between 1612 and 1614. A deed of arbitration in his hand, dated 1612, relating to the settlement of a dispute between the sons of a land-owner named Tōḍar, who possessed some villages adjacent to Benares, has been preserved, and is reproduced in facsimile in Dr. Grierson's *Modern Vernacular Literature of Hindustan*, p. 51 Tōḍar (who was not, as formerly supposed, Akbar's finance minister, the celebrated Rāja Tōdar Mall) was his attached friend, and a beautiful and pathetic poem[1] by Tulsī on his death is extant. He is said to have been resorted to, as a venerated teacher, by Mahārāja Mān Singh of Jaipur (d. 1618), his brother Jagat Singh, and other powerful princes; and it appears to be certain that his great fame and influence as a religious leader, which remain pre-eminent to this day, were fully established during his lifetime.

Tulsī's great poem, popularly called *Tulsī-krit Rāmāyan*, but named by its author *Rām-charit-mānas*, "the Lake of Rāma's deeds," is perhaps better known among Hindūs in upper India than the Bible among the rustic population in England. Its verses are everywhere, in this region, popular proverbs. Not only are Tulsī's sayings proverbial: his doctrine actually forms the most powerful religious influence in present-day Hinduism; and, though he founded no school and was never known as a *guru* or master, but professed himself the humble follower of his teacher, Narharī-Dās, from whom as a boy in Sūkar-khēt he heard the tale of Rāma's doings, he is everywhere accepted as an inspired and authoritative guide in religion and conduct of life.

The poem is a rehandling of the great theme of Vālmīkī, but is in no sense a translation of the Sanskrit epic. Besides the *Lake of Rāma's deeds*, Tulsī Dās was the author of five longer and six shorter works, most of them dealing with the theme of Rāma, his reign, and devotion to him. The former are (1) the *Dōhābalī*, consisting of 573 miscellaneous *dōhā* and *sōraṭhā* verses; of this there is a duplicate in the *Rām-satsaī*, an arrangement of seven centuries of verses, the great majority of which occur also in the *Dōhābalī* and in other works of Tulsī; (2) the *Kabutta Rāmāyan* or *Kabittābalī*, which is a history of Rāma in in the *kabitta*, *ghanākshari chhappāī* and *sawaiyā* metres; like the *Rām-charit-mānas*, it is divided into seven *kāṇḍs* or cantos, and is devoted to setting forth the majestic side of Rāma's character, (3) the *Gīt-Rāmāyan*, or *Gītābalī*, also in seven kāṇḍs, aiming at the illustration of the tender aspect of the Lord's life; the metres are adapted for singing; (4) the *Krishnāwali* or *Krishna gītābalī*, a collection of 61 songs in honour of Krishna, in the Kanauji dialect, the authenticity of this is doubtful; and (5) the *Binay Patrikā*, or "Book of petitions," a series of hymns and prayers of which the first 43 are addressed to the lower gods, forming Rāma's court and attendants, and the remainder, Nos. 44 to 279, to Rāma himself. Of the smaller compositions the most interesting is the Vairāgya Sandīpanī, or "Kindling of continence," a poem describing the nature and greatness of a holy man, and the true peace to which he attains. This work has been translated by Dr. Grierson in the *Indian Antiquary*, xxii. 198–201.

A manuscript of the *Ayōdhyā-kāṇḍ*, said to be in the poet's own hand, exists at Rājāpur in Bāndā, his reputed birthplace. One of the *Bāl-kāṇḍ*, dated *Sambat*, 1661 (A.D. 1604) 19 years before the poet's death, and carefully corrected, it is said, by Tulsī Dās himself, is at Ajōdhyā. Another autograph is reported to be preserved at Malihābād in the Lucknow district, but has not, so far as known, been seen by a European. Other ancient MSS. are to be found at Benares, and the materials for a correct text of the *Rāmāyan* are thus available. Good editions have been published by the *Khadga Bilās* press at Bānkipur (with a valuable life of the poet by Baijnāth Dās), and by the *Nāgarī Pracharinī Sabhā* at Allahabad (1903). The ordinary bāzār copies of the poem, repeatedly reproduced by lithography, teem with interpolations and variations from the poet's language. An excellent translation of the whole into English was made by the late Mr. F. S Growse, of the Indian Civil Service (5th edition, Cawnpore, 1891). The best account of Tulsī Dās and his works is contained in the papers contributed by Dr. Grierson to vol. xxii. of the *Indian Antiquary* (1893). In Mr. Growse's translation of the *Rām-charit-Mānas* will be found the text and translation of the passages in the *Bhaktamāla* of Nābhājī and its commentary, which are the main original authority for the traditions relating to the poet. In the introduction to the edition of the *Rāmāyan* by the *Nāgarī Prachārinī Sabhā* all the known facts of Tulsī's life are brought together and critically discussed. For an exposition of his religious position, and his place in the popular religion of Northern India, *see* Dr. Grierson's paper in the *Journal of the Royal Asiatic Society*, July 1903, pp. 447–466. (C. J. L.; X.)

See Sir G. A. Grierson, *Notes on Tulsi Das* (Allahabad, 1921).

TULU LANGUAGE, otherwise TULUVA, a language of the Dravidian family, found chiefly in the south Kanara district of Madras. It has no literature, nor has it been adopted for official use even where it is spoken by the majority of the population. It is regarded as one of the most highly developed languages of the Dravidian family and must be classed as lying between Tamil and Kanarese, nearer to the latter than to the former. *See* Bishop Caldwell, *Comparative Grammar of the Dravidian Languages* (1875); *Linguistic Survey of India*, vol. iv. (1906).

TUMACO, a seaport city of southwestern Colombia in the department of Nariño, the southernmost of Colombia's port cities and, next to Buenaventura, the most important Colombian port on the Pacific side Tumaco is located on an island on the south side of the bay of Tumaco. It is served by a short railroad

[1] See *Indian Antiquary*, xxii. 272 (1892).

line which goes only as far as Diviso, by the Barranquilla-Guayaquil air line and by a road which joins the Simón Bolívar highway between Pasto and Ipiales. Pop. (1938) 9,671. Tumaco and the region around it were visited by Francisco Pizarro, and the city later gained some importance because of its port facilities during the period when Colombia was attempting to win its freedom from Spain.

Tumaco is a shipping centre for goods sent down the Rio Patía, which drains into the bay of Tumaco.

TUMBES, a department of Peru, is situated on the Pacific coast in the extreme northwest between Ecuador on the east and the department of Piura on the south. Formerly a littoral province, it was given departmental status in 1942. It is the country's smallest department, with an area of 1,591 sq mi. The population was 31,201 in 1950. Its capital is the city of Tumbes (pop. 7,712), on the Tumbes river 7 mi. from its port of Puerto Pizarro, with which it is linked by rail. The district was an ancient Inca stronghold, and Tumbes was a prosperous city when Francisco Pizarro made his initial landing nearby (1527) and used it as his base for the conquest of the Inca empire. The region's ready accessibility brought modern development early. In 1863 an oil well was sunk near Zorritos, marking the beginning of the important oil industry. The Zorritos-Chira oil fields (partly in Tumbes and partly in Piura) account for most of Peru's oil production and have reserves estimated at more than 5,000,000,000 bbl. Fishing, especially for lobster, is important. Other products include sugar, tobacco, coffee and cacao, along with salt and some gold. (L. W. Be.)

TUMBLEWEED, a botanical term for a plant which breaks loose at the ground line when dry, and is blown about, scattering its seeds by the way. Tumbleweeds are most abundant in semi-arid regions. Examples are: tumbling pigweed (*Amaranthus graecizans*), Russian thistle (*Salsola kali*), winged pigweed (*Cycloloma atriplicifolium*), bugseed (*Coriphernum hyssopifolium*), tumbling mustard (*Sisymbrium altissimum*) and witch grass (*Panicum capillare*).

TUMBLING MUSTARD (*Sisymbrium altissimum*), an annual weed of the mustard family (Cruciferae, *q.v.*), native to Europe and extensively naturalized in North America, especially in the northern states and adjacent Canada. It is tall, freely branching and has deeply cut leaves. The small pale-yellow flowers produce long, narrow, spreading seed pods. One plant may ripen more than 500,000 seeds.

TUMKUR, a town and district of southern India, in the west of Mysore state. The town (pop., 1941, 21,893), which is a health resort on the Devarayadurga hills, has a station on the Madras and Southern Mahratta railway, 43 mi. N.W. from Bangalore. The area of the district is 4,082 sq.mi.

It consists chiefly of elevated land intersected by river valleys. A range of hills rising to nearly 4,000 feet crosses it from north to south, forming the water parting between the systems of the Krishna and the Cauvery. The principal streams are the Jayamangala and the Shimsha. The population in 1931 was 861,405. The cultivated products consist chiefly of millets, rice, pulses and oilseeds.

TUMMEL, a river of Perthshire, Scot. Discharging from Loch Rannoch, it flows eastward to a point near the Falls of Tummel, where it flows southeast until it falls into the Tay, just below Logierait, after a course of 58 mi. from its source in Stob Ghabbar (3,565 ft.).

Its only considerable affluent is the Garry, 24 mi. long, which issues from Loch Garry (2½ mi. long, ¼ mi. wide). About midway in its course the Tummel expands into Loch Tummel (2¾ mi. long, ½ mi. wide), between which and the confluence with the Garry occur the pass and falls of the Tummel.

TUMOUR. In its broad sense the word "tumour" may be applied to any localized swelling irrespective of origin, location or composition. In its restricted sense, however, it denotes an abnormal growth of new tissue, arising by unknown cause from pre-existing body cells, having no purposeful function and being characterized by a tendency to autonomous and unrestrained growth. Thus we may recognize two main groups of swellings: **false** tumours or nonneoplastic **swellings,** and true tumours or neoplasms, conforming to the restricted definition just mentioned.

The essential basis for this distinction lies in the cellular composition of all living tissues, normal and abnormal. Only by a recognition of the distinctive appearance and characters of the individual cells forming a tissue or swelling can we attempt to define accurately the nature, origin and entity of a tissue mass. Swellings may be composed of (1) normal body cells, (2) abnormal body cells, or (3) foreign cells, introduced from without the body. Cells of the second variety differ from the first in having undergone alterations in appearance, character or arrangement as follows.

Hypertrophy denotes an increase in the size of individual cells. This feature is occasionally encountered in true tumours but occurs commonly in other conditions.

Hyperplasia denotes an increase in the number of cells within a given zone. In some instances it may constitute the only criterion of tumour formation.

Anaplasia denotes a regression of the physical characteristics of a cell toward a more primitive type. This is an almost constant feature of malignant tumours, though it occurs in other instances both in health and in disease.

True tumours in general are characterized by a growth of cells exhibiting one or more of these three variations from normalcy.

FALSE TUMOURS

These form a heterogeneous group. In most instances the cause and origin of the swelling is known and well understood

Inflammatory Swellings.—These are formed in the normal course of the reaction of the body to irritants. The mass of the swelling is composed mainly of cells of normal body type which, in response to a noxious stimulus, are incited to multiply and concentrate in the zone that is the seat of the attack. The two common causes of inflammation are trauma and bacterial infection. Traumatic swellings of an acute nature include such conditions as a bruise, a haematoma (viz., a black eye), or a sprain. Examples of chronic traumatic swellings are calluses, bursitis (viz., housemaid's knee), or an overgrowth of bone after an inaccurately healed fracture. Infectious swellings of an acute nature include boils, abscesses, felons, and inflamed lymphatic glands. Those of chronic type result from tuberculosis, syphilis, actinomycosis, leprosy, etc.

Hypertrophic Swellings.—The essential feature of these is an increase in the size (hypertrophy) and number (hyperplasia) of the cells constituting the organ or part concerned. The excessive muscular development of the calves of the legs of some ballet dancers is an example, likewise the enlargement of the breasts and uterus in pregnancy. All such swellings result from normal physiological processes and as such do not constitute true disease.

Parasitic Swellings.—These result from the multiplication within the body of living cells introduced from without. The only common example is hydatid disease which gives rise to the formation of cysts in the internal organs. Both the wall and the contained fluid are derived from the foreign cells. They evoke a variable amount of inflammatory response on the part of the adjacent body cells.

Cysts.—These constitute a heterogeneous group since some cysts are true tumours, which happen to develop in spherical form with a central space occupied by degenerative fluid products of their own cells. Other cysts result from cystic degenerative changes occurring within the solid substance of true tumours. Many, however, are not related to tumours at all, the following being specific examples: retention cysts, dilated glands whose effluent ducts are blocked, *e.g.*, sebaceous cysts (wens); distention cysts, formed by the dilatation of closed sacs which normally contain but little fluid, *e.g.*, hydrocele; congenital cysts, which do not necessarily appear at birth but are all derived from embryological structures which have persisted fortuitously, *e.g.*, thyroglossal, branchial cysts; parasitic cysts (described above); degenerative cysts, *e.g.*, a ganglion of the wrist, blood cysts.

All cysts contain fluid free within a closed cavity. The nature of the fluid may be bloody, mucoid, milky, etc. Clear fluids such

as lymph, in cysts near the surface of the body, will transmit light and hence are translucent Aspiration of the contents is frequently practised as a means of diagnosis Treatment consists in surgical removal where and when indicated.

Degenerative Swellings.—These result from distention of hollow organs or tissues following an abnormal weakness of their walls or their investing membranes. Examples include aneurysms, varicose veins, hernias, diverticula.

False Swellings.—Deeply seated organs or structures may become abnormally prominent because of the wasting of their superimposed coverings. A false impression of enlargement may therefore appear.

Swellings of Unknown Origin.—This group embraces a few swellings whose nature and origin is the subject of doubt and debate They may or may not be true tumours, inflammations or degenerations. The outstanding example is Hodgkin's disease of the lymphatic glands.

Phantom Tumour is a term applied to the apparent enlargement of the lower abdomen that occurs in women who suffer from an hysterical conviction that they are pregnant. It is not infrequently accompanied by alleged concomitant accessory signs of pregnancy.

The "tumour" promptly disappears under the influence of hypnosis or anaesthesia.

TRUE TUMOURS

These are composed of masses of tissue cells developed from pre-existing body cells. In some instances the tumour cells are normal in appearance, faithful reproductions of their parent types; such tumours are generally benign Other tumours are composed of cells slightly different from normal adult types, different in appearance, size, shape and structure; these tumours are usually malignant, and the specific changes in cell type are those of anaplasia.

Cause.—We have seen that the false tumours are initiated by a definite and in many instances a specific cause, but in the case of true tumours, the cause is unknown. The method by which a tumour grows; *i.e.*, the proliferation of body cells, is a process that normally occurs in health. Body cells, like men, have their allotted span of life, varying from a period of days to years, whereupon they are replaced. New cells do not arise *de novo* but by fission, one (mother) cell dividing into two (daughter) cells; the daughters (twins) are identical with each other and with their late mother. When tissue is lost, as by a burn of the skin, the defect is reconstituted by the multiplication of adjacent body cells This process proceeds until the defect is properly repaired, and then it ceases. We can see the necessity and logic for the initiation of such a process but we can only marvel at the mechanism which finally throttles the cellular proliferation at the exact moment of normalcy. It is presumed that the reparative process of cell proliferation is initiated by a normal stimulus and is stopped by a similarly normal stimulus.

Tumours arise by a proliferation of body cells in the absence of a normal stimulus, or, alternatively, in the presence of an abnormal stimulus; the precise nature of both processes still defied elucidation at mid-20th century. Without any discernible cause, the cells of a tissue start to multiply as though to fill a defect that does not exist One important difference from the normal reparative process is a tendency for the daughter cells to assume characters of a nature more primitive than that of their predecessors, hence becoming anaplastic.

Certain factors are generally believed to favour the initiation of tumour formation in isolated instances, and outstanding among these is chronic irritation. Employment in certain trades and occupations predisposes to the development of certain tumours; these occupations are associated with long continued exposure to mild irritation of various parts of the body. Experimental production of tumours by irritational methods has been accomplished in animals, but it is unlikely that these methods are identical with those that cause the spontaneous origin of tumours in otherwise normal human beings.

Among other factors is heredity. There is some evidence that inherited characteristics may predispose the development of tumours, particularly of the malignant type. Many experimental studies with mice demonstrate the possibility of breeding, by planned selection, a strain of animals that will show almost 100% cancer production. The extremely high incidence of human cancer in certain family groups is well known, but appears to constitute only a minor subfactor in the propagation of the disease.

Infection by micro-organisms has not been proved as a cause. Certain experimental tumours of fowl have been shown to be transmitted by a filterable virus. The only possible instance of this mode of tumour formation in man would appear to be the "crops" of "soft" warts commonly occurring in childhood, but there is some doubt that these warts are true tumours.

Trauma is a factor occasionally imputed, notably in instances coming to the attention of workmen's compensation boards It would seem that in some instances certain tumours, usually of a sarcomatous nature, may be causally related to trauma, but definite proof was far from established at mid-century, since the experimental production of a tumour in this manner had yet to be demonstrated conclusively.

The Vicious Autonomy of Tumours.—Natural inflammatory swellings are primarily beneficial to the body since they constitute one phase of the protective response of the body to noxious stimulus. True tumours, on the other hand, serve no such useful function. In many instances their only role is to kill the patient. They grow for their own sakes alone, and at the expense of the body economy.

The capacity of inflammatory tumours to form and function depends upon the general healthiness of the body. In people who are poorly nourished or ill, the inflammatory response may be poor or absent. True tumours on the other hand observe no such compliance with the general body resources. Even though a person be so physically exhausted that a recently sustained wound may fail to show any attempt at healing, a true tumour currently present will continue to grow by cell proliferation, ignoring the ebbing vitality of the patient. In this respect tumours behave as parasites.

Whenever normal cellular proliferation is required to carry out body repairs, the multiplying cells tend to reconstruct as faithfully as possible the normal architecture of the part lost or destroyed. Proliferating tumour cells on the other hand follow no plan or deviate grossly from the original tissue pattern This of course is at least consistent with their utter lack of function since no structural specification is therefore required. Indeed their perversity is sometimes manifested by the development of abnormal symptoms through their overproduction of malicious ferments, as in certain tumours of the thyroid gland and pancreas

Clinical Manifestations.—The mass of newly formed tumour cells usually constitutes a definite localised swelling. Should such a mass occur on or near the surface of the body, it can be felt or seen as a lump. But since tumours may develop in any organ or tissue, however deeply placed, the swelling may not always be palpable.

Some tumours, notably those of the malignant variety, may assume physical characteristics other than that of lumps. Thus they may appear as ulcers, indurated cracks or fissures, wartlike projections, or as a diffuse ill-defined infiltration of what appears to be an otherwise normal organ or tissue. The tumour cells may replace completely the normal cells of the part and should the processes of proliferation of new cells and the destruction of normal cells both proceed at the same pace, there may be only little gross change in the size of the part, though there will usually be an alteration in the consistency of the tissues. In other cases the normal cells may disappear more quickly than the tumour cells appear, so that the affected part may actually shrink in size. This is seen in certain cancers of the breast and in the annular type of cancer of the bowel.

Tumours which arise in the tubular structures of the body; *e.g.*, the intestinal, biliary or urinary tracts, are prone to cause obstruction since the normal contents of these tubes are no longer free to pass along their lumina. Thus intestinal, biliary, etc., obstruction may be produced. Furthermore, such tumours,

being located in the walls of these various tubes, actually may bleed into the tract concerned, and the blood subsequently appears at the natural body orifices; viz., the vomiting of blood resulting from cancer of the stomach, or the passage of bloody urine in cases of tumours of the kidney or bladder. Again, the tumour by virtue of its mass as a foreign body may initiate the production of pus or mucus and these substances likewise are passed to the surface of the body.

Tumours arising within the bony cages of the body; *e g*, chest, skull and spinal column, may cause symptoms by exerting direct pressure on adjacent vital structures such as the heart, brain and spinal cord. Those developing within the interior of a bone may so weaken the bone as to cause a collapse, bending or actual fracture. The destruction of specific tissue in which the tumour develops may so interfere with local function as to cause specific symptoms; *e.g.*, loss of vision in the case of an intraocular tumour.

Pain is a variable symptom. It may result from direct pressure on, or irritation of, adjacent nerve tracts, *e.g.*, the spinal cord, or by producing increases of pressure within a rigid cavity, *e.g.*, headache in the case of brain tumour; or by producing obstruction of a muscular tube with concomitant colic, *e g.*, tumours of the intestine. Thus, in their early stages all tumours tend to be painless, and even though they grow to a large size, should there be no interference with local function, they may remain painless. Later, however, the malignant variety commonly causes pain by the direct invasion of nerve trunks or by destruction of bone. Tumours themselves are largely devoid of nerve fibres, excepting, of course, those that are composed of nervous tissue.

Classification of Tumours.—When we recall that tumours may arise in any part of the body and from every type of cell and tissue in the body, that they may possess the phenomenon of malignancy in any degree, we must realize that an accurate, all-embracing classification has yet to be achieved.

The fact that we are still uncertain of the identification of some of the precursor cells from which tumours arise serves only to augment the difficulty.

Since all tumours are composed of cells, we try to classify them according to the specific type of cell predominating in any particular instance This constitutes the histologic basis of classification, the microscopic study of cellular structure. In general two main types of body tissue are recognized. (1) epithelial tissue, which forms the surfaces of the body and its tubular cavities and glands and (2) connective tissue, whose function is essentially supportive. It is therefore possible for tumours to be composed of three types of tissue, namely, epithelial tissue, connective tissue and tissues of mixed or uncertain type. The introduction of the last group adds a note of variability characteristic of all biologic processes.

Classification of Tumours

Classification according to behaviour	Classification according to tissue of origin		
	Connective tissue	Epithelial tissue	Tissue mixed or indefinite
Benign	lipoma fibroma angioma chondroma osteoma myxoma neuroma myoma fibromyoma osteochondroma glioma tumour	papilloma adenoma implantation dermoid	odontoma fibroadenoma adenomyoma fibropapilloma
Malignant	sarcoma	carcinoma	specific adrenal tumours
Variable in malignancy or locally malignant	giant cell tumour glioma endothelioma chordoma	rodent ulcer	melanoma mixed salivary tumour carcinoid tumour embryological tumours

Long before the advent of the microscope as an aid to histologic study, medical men classified tumours on the basis of their ultimate effect on the patient; *i.e.*, the clinical classification. While the histologic picture of a tumour is of interest to the pathologist, the effect of the tumour on the life and happiness of the patient is of far more importance to the patient himself. Hence the ancient clinical classification of tumours into the benign and the malignant types. The malignant tumours are those that, in general, always kill the patient eventually if left untreated of if not drastically eradicated at an early stage of development This distinction of the clinical behaviour of tumours holds good only up to a point, for it is known that some benign tumours; *e g*, a lipoma, may readily cause death purely by virtue of location by exerting pressure on the spinal cord. Other tumours appear to fall between the two main clinical divisions in that they may be only locally malignant, destroying all normal tissue in their vicinity, but not spreading widely from their point of origin. Thus we may classify tumours on a clinical basis as benign, malignant, or of local or variable malignancy. Again the acknowledgment of a third group, while typifying the vagaries of biologic processes, serves also to enhance the difficulties in formulating a satisfactory classification of tumours.

Malignancy of Tumours.—Malignancy refers to the tendency of a tumour to produce death. But we have seen that any tumour, of any type, may produce death by local effects if appropriately situated.

Thus the specific definition of malignancy implies an inherent tendency, on the part of the cells composing it, to invade the body widely and relentlessly, to become disseminated by subtle means, and eventually to kill the patient unless all the malignant cells can be drastically and completely eradicated.

The outstanding gross characteristic of malignancy is the property of tumour cells to wander from their site of origin. Though the tumour may arise from one site in one tissue or organ, it may eventually establish metastases in almost every tissue and organ of the body.

In contrast, the cells of a benign tumour invariably remain in contact with each other in one solid mass centring at the site of origin. This gross physical continuity of the benign tumour cells enables them to be removed completely by surgical means, providing the location is suitable. But the dissemination of malignant cells, each one individually possessing the facilities and tendency to give rise to new masses in new and distant sites, precludes complete eradication by a single manoeuvre in all but the earliest period of growth.

The question frequently arises, does a benign tumour ever become malignant? In other words, is malignancy a property that may be acquired by benign tumour cells? We know that normal body cells, if subjected to the appropriate (and unknown) stimulus, may form tumours and these tumours may be either benign or malignant *ab initio*. Both types of tumour rarely are found in the same individual at the same time. Still more rarely does a primarily benign tumour appear to become transformed into a malignant one. It is not easy to be certain concerning the acquisition of malignant transformation; it is possible for a primarily malignant tumour to remain quiescent, mimicking a benign one clinically, for a long time.

Of the group of tumours in which malignancy is variable, some are benign from the start and remain so; others are apparently malignant from their moment of origin; and finally, a few appear to change from innocent to malignant type. In the latter case the histologic picture of the tumour before and after malignant transformation may show no differences. Thus, acquired malignancy is not necessarily dependent upon discernible changes in the appearance of the tumour cells.

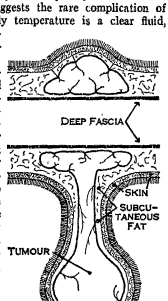
To sum up, a benign tumour may undergo malignant transformation but the cause of such change is unknown. The regression of a malignant tumour to benign type is, lamentably, unknown.

For a discussion of malignant tumours *see* under CANCER; CANCER RESEARCH.

BENIGN TUMOURS

Characteristics.—Benign tumours tend to occur in younger people, most of them appearing before the age of 40. Histologically their cells show no great variation in detail from those of normal tissue, in contrast to the appearance of cancer cells. The

arrangement of the new cells may suggest an abortive attempt to reproduce the normal structure of the part but this effort is usually crude and ineffectual. All tend to remain localized at the site of origin.



They enlarge by accretion, pushing aside the adjacent tissues without involving them intimately. Malignant tumours, on the other hand, invade the surrounding structures, thereby becoming fixed to them.

Many benign tumours are encapsulated. The capsule consists of a connective tissue derived from the structures immediately surrounding the tumour. While it serves to demarcate the tumour it does not act as a limiting membrane Malignant tumours, as a rule, do not possess a capsule though some of the sarcomas arising from soft tissues may have a pseudocapsule in their early stages. The chief effect of the capsule is to lend the physical property of mobility to the tumour mass. Well-encapsulated tumours are not anchored to their surrounding tissues. It may be possible to bounce the tumour about in the part; *e g.*, a fibro-adenoma of the breast or, should the tumour arise from a bone (an osteoma), the enveloping muscles and tendons will move freely over and around the mass.

Benign tumours of any one type are frequently multiple, several arising in different parts of the body either simultaneously or in succession. In such cases all the tumours are identical. It is most unusual for more than one malignant tumour to arise primarily, but, should this primary tumour give rise to metastases, these secondary masses tend to differ from the primary growth in their gross physical characteristics, though remaining identical histologically.

Benign Tumours Arising from Connective Tissue.—*Lipoma.*—This is the commonest of all neoplasms and consists of fat cells which are microscopically indistinguishable from normal fat cells They are invariably ensheathed in a delicate transparent capsule which sends fine septa through the body of the tumour making it lobulated. Thus are explained the two outstanding characteristics of the tumour; namely, lobulation and a firm demarcated edge. Small lipomas tend to be plaque-shaped, larger ones hemispheroidal, while others may become pedunculated. Since normal fat is a soft structure, so too are most lipomas, though in their infancy they are frequently firm. Pain is a most unusual feature and suggests the rare complication of calcification. Since fat at body temperature is a clear fluid, prominent tumours near the surface of the body may be translucent in a strong beam of light.

They tend to occur in all situations where normal fat is found and thus may be classified according to site; namely, subcutaneous, subfascial, subserous, submucous, subsynovial, with rarer occurrence in the subperiosteal and subcapsular regions. By far the commonest site is the subcutaneous plane, immediately deep to the skin (*see* fig. 1). While commonly single, they may be present in scores. They vary from the size of a pea to that of a football and while they may arise at any age they are rare in the first decade of life. It is generally conceded that they are not subject to malignant change, those so-called malignant lipomas being liposarcomas from the start.

FROM "THE CLINICAL DIAGNOSIS OF SWELLINGS" (THE WILLIAMS AND WILKINS COMPANY) BY COURTESY OF DR. C. E. CORNMAN

FIG. 1.—SUBCUTANEOUS LIPOMAS

Treatment consists of removal of the tumour by surgical excision, the indications being cosmetic defect or interference with the function of local structures; *e g.*, when the tumour is located within the bowel or is exerting pressure on the spinal cord. Complete removal is usually effected quite easily and is never followed by recurrence

Diffuse lipomas are characterized by absence of a limiting capsule. They are probably not true neoplasms but rather result from disturbances of metabolism.

Fibroma.—This is a rare tumour composed of white fibrous tissue enclosed in a thick tough capsule. It is usually spherical in shape, hard, painless, freely movable and varied in size but it seldom exceeds the dimensions of an orange. A "soft" variety is described but is uncommon. They are found in the bones—chiefly about the gums of the jaws and the nasopharynx; in the tendon sheaths—chiefly on the back of the wrist; in certain glands of the body (breast, ovary, testicle); and in the nerves.

The latter site is the commonest. Here the tumours spring from the fibrous sheath of the nerve rather than from the conducting tissue—hence they contain no nerve elements. The eighth cranial nerve is especially prone to be affected, giving rise to the so-called acoustic neuroma.

Von Recklinghausen's disease consists of multiple small fibromas affecting the subcutaneous nerves of the body and is accompanied by a patchy discoloration of the skin. The condition tends to be inherited and of familial proportions. Molluscum fibrosum, plexiform neuroma and elephantiasis neuromatosa are other clinical manifestations of multiple fibromas Two complications are observed, myxomatous degeneration and malignant transformation to sarcoma, the latter supervening particularly on the "soft" variety of fibroma

Treatment consists of early excision of the single types. There is no uniformly satisfactory method of dealing with the disease in its multiple form.

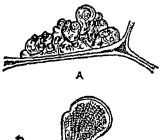
Angioma.—This tumour is composed of vessels of which there are two types (1) haemangiomas, or tumours of blood vessels and (2) lymphangiomas, tumours of lymphatic vessels.

The *haemangiomas* are of three varieties, depending on the type of blood vessel forming the tumour.

The capillary haemangioma is the commonest form of birth mark It consists of a mass of fine capillary vessels stuffed with circulating blood It is seen most commonly in the skin but may affect deeper structures as well. In its typical form it consists of a reddish, roughened, raised patch, painless, often with an ill-defined border. The colour is due to the concentration of blood and frequently this can be expelled partially by pressure with a finger tip, causing the zone so pressed to blanch. It does not possess a capsule.

The tumours, either single or multiple, appear shortly after birth and tend to increase in size for a few months. Many of them disappear spontaneously.

The only serious complication is haemorrhage, which in some instances may be fatal. Treatment consists of excision if feasible, if not, in radiation by means of X-ray or radium. They do not tend to recur.



The cavernous haemangioma consists of a growth of blood vessels of the character of veins. Hence they appear, when near the surface, as soft, painless, bluish, wormy masses which can be emptied by compression and will refill by dependency. If located close to the trunk of the body, they may show an impulse on coughing. They occur in the subcutaneous plane, in the muscles, in the solid viscera and in the bones—one tumour only being the rule. In the bones they are prone to erode their parent site and cause collapse or fracture. Frequently they possess a partial capsule of thin connective tissue.

Treatment is best effected by excision if possible, otherwise—as in vertebral sites—by radiation.

The plexiform haemangioma consists of a mass of large vessels of arterial type and calibre. Not infrequently large venous channels are present as well. The temporal region of the head is the only common site, where the swelling appears as a pulsating mass which may erode the skin and the underlying bone. Treatment consists of complete and careful excision.

The *lymphangiomas* are rare tumours and, like their haemal cousins, are of three types. Capillary lymphangiomas consist of tiny pearly vesicles the size of pinheads, affecting chiefly the

lips and tongue. The cavernous type, also known as cystic hygroma, consists of large, thin-walled, translucent lymphatic cysts, usually found in the neck. The plexiform type consists of a wormy mass of grossly dilated lymphatic vessels and, like the capillary type with which they are frequently associated, they tend to affect the lips and the tongue. All lymphangiomas may be treated by excision or radiation. None possesses a well-defined capsule.

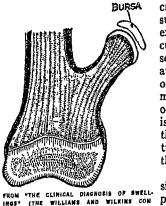
FIG. 2.—(A) ECCONDROMA OF THE SCAPULA, (B) ECCONDROMA OF THE HUMERUS

Chondroma.—This is a tumour composed of hyaline cartilage which is the embryologic precursor of bone. While normally confined to bony sites, these tumours occasionally are encountered free in soft tissue sites. They form firm lobular masses enclosed in a thick capsule. Two types are described. The *ecchondromas* (fig. 2) grow outward from the surface of their parent bone—commonly the flat bones of the skeleton. They may attain the size of a coconut and they push aside the overlying structures. They are usually single. The *enchondromas* (fig. 3) develop within the interior of bones—usually the smaller long bones of the hands, feet and digits. They are commonly multiple and bilaterally placed. As they grow they expand and thin the cortex of their parent bone, producing considerable deformity. They may erupt through their bony covering and project outward into the surrounding soft tissues.

All chondromas tend to be painless, but are subject to myxomatous degeneration and sarcomatous change. All should be treated by complete surgical excision.



Osteoma.—This is a tumour composed of bone. Two varieties are distinguished. The *cancellous* osteoma (fig. 4) is made up of all the elements of the shaft of a long bone, including both the spongy medulla and the firm compact cortex. Its gross appearance suggests a ballooning outward of a portion of the parent bone at one point. They form hard painless masses deeply attached to the skeleton, displacing the soft tissues about them. Not infrequently they are capped by a bursa which may be the seat of periodic inflammation, thus causing pain overlying the swelling. These tumours probably form as the result of an accidental deviation from the normal pattern of growth in a long bone, for they arise only during the period of bone growth—under the age of 25, and they cease to enlarge when their parent bone reaches maturity. Both single and multiple varieties occur. Treatment is effected by surgical excision.

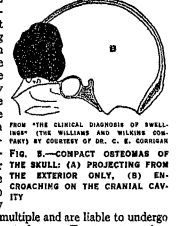
FIG. 3.—ENCHONDROMAS OF THE SMALL BONES OF THE HAND

The *compact* osteoma (fig. 5) consists of a proliferation of the dense cortical layer only of a bone. They are usually single tumours and constitute the hardest substance the human body is capable of producing. They occur on the surface of the flat bones of the body, notably the vault of the skull and the lower jaw. In the case of the skull they may grow from either the external or internal surface, or both, thus occasionally projecting into the cranial cavity and exerting pressure on the brain. When growing externally they form a hard circumscribed boss over which the scalp rides freely. They occur at any age. Treatment consists of removal by sectioning the normal bone close to the periphery of the mass, since no instrument is sufficiently staunch to attack the tumour itself without fracturing the adjacent portion of the skull.

FROM "THE CLINICAL DIAGNOSIS OF SWELLINGS" (THE WILLIAMS AND WILKINS COMPANY) BY COURTESY OF DR. C. E. CORNIBAR

FIG. 4.—CANCELLOUS OSTEOMA OF THE LOWER END OF THE FEMUR



Myxoma is a rare tumour consisting of a mass of jellylike primitive connective tissue.

Neuroma is an equally rare tumour formed of nerve cells and fibres, usually derived from the autonomic nervous system.

Myoma, in pure form, is again a rare tumour consisting of muscle tissue only.

The *leiomyoma* is derived from smooth muscle fibres, the *rhabdomyoma* from striated muscle fibres.

Fibromyoma.—This is a tumour composed of two elements of connective tissue—fibrous tissue and smooth muscle tissue. It is a common tumour, occurring much more frequently than either of its composites in pure form. Its site of election is the uterus, where it is colloquially termed a "fibroid." It is also the commonest of all tumours of the uterus and develops there in three situations—either projecting outward from the womb, enlarging the body of the womb, or projecting into the cavity of the womb in which case it is prone to bleed. These tumours may grow to a colossal size, are frequently multiple and are liable to undergo simple degenerations and malignant change. Treatment consists in surgical removal which, owing to their multiplicity and their deep-seated location, may demand the complete removal of the uterus.

FROM "THE CLINICAL DIAGNOSIS OF SWELLINGS" (THE WILLIAMS AND WILKINS COMPANY) BY COURTESY OF DR. C. E. CORNIBAR

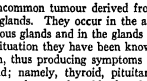
FIG. 5.—COMPACT OSTEOMAS OF THE SKULL: (A) PROJECTING FROM THE EXTERIOR ONLY, (B) ENCROACHING ON THE CRANIAL CAVITY

Osteochondroma is the hybrid of the two "pure" tumours, osteoma and chondroma. They occur in sites common to the chondromas and clinically resemble the latter tumours closely. They should be treated by surgical removal.

Glomus Tumour.—This peculiar swelling consists of a mass of blood vessels, nerve cells and fibres and epithelioid cells. It occurs chiefly on the extremities; the hands, feet and digits are the common sites. It usually presents as a single, exquisitely tender, tiny reddish patch immediately deep to the skin or a finger nail. It is seldom as large as a grain of wheat when first discovered, the attention of the patient being focused by the inordinate pain which results from any manipulation of the part. It is believed to arise by proliferation of the local nervous mechanism of the lateral capillary "shunts." Treatment consists of surgical excision.

Benign Tumours Arising from Epithelial Tissue.—*Papilloma* consists of a sprouting projecting mass of new tissue derived from a surface epithelium. Three histologic types are described, based on the type of epithelium composing the tumour. None are encapsulated.

Squamous papilloma arises from a stratified squamous epithelium. The skin is the commonest site; there the process results in a wart. These are frequently multiple and in some instances

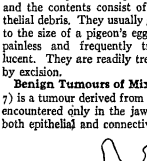


may not be neoplastic at all. Other sites include the tongue, mouth and vocal cords. All may be treated by surgical excision or radiation.

Transitional papillomas are confined to the urinary tract, the kidneys, ureters and bladder. They contain a rich arborization of blood vessels surrounded by a delicate layer of epithelium. Hence their usual complication is haemorrhage, which is manifest by the painless passage of blood in the urine. In addition they may give rise to urinary obstruction and infection. All transitional papillomas are prone to become malignant and should therefore be eradicated as soon as diagnosed. If they occur in the bladder they may be cauterized with an electric current.

Columnar cell papillomas spring from and project into the interior of the gastrointestinal tract, the larger ducts of the breast and the walls of certain cysts. They have a tendency to bleed easily, thereby producing bloody effluxes, and all are prone to undergo cancerous change. They should be removed surgically when diagnosed.

Adenoma in pure form is an uncommon tumour derived from the secreting cells and tubules of glands. They occur in the alimentary tract, mucous and cutaneous glands and in the glands of internal secretion. In the latter situation they have been known to elaborate an excess of secretion, thus producing symptoms of overactivity of their parent gland; namely, thyroid, pituitary, parathyroid or pancreas. Elsewhere they tend to bleed and in the intestine they may produce obstruction. They are usually small spherical painless masses surrounded by a definite capsule. Treatment consists in surgical removal.



Implantation dermoid (fig. 6) is a tumour which assumes the form of a cyst. The common sites are the palms of the hands and the fingers. The popular theory of origin implies the growth of a bit of skin transplanted to a depth in the subcutaneous tissues. The wall of the cyst is formed of stratified squamous epithelium and the contents consist of epithelial debris. They usually grow to the size of a pigeon's egg, are painless and frequently translucent. They are readily treated by excision.

FROM "THE CLINICAL DIAGNOSIS OF SWELLINGS" (THE WILLIAMS AND WILKINS COMPANY) BY COURTESY OF DR C E CORRIGAN

FIG. 6.—IMPLANTATION DERMOID OF THE FINGER

Benign Tumours of Mixed Tissue Origin.—*Odontoma* (fig. 7) is a tumour derived from the elements of teeth and is therefore encountered only in the jaws. Since the teeth are derived from both epithelial and connective tissue elements, many varieties of odontoma may occur but man, in contrast to animals, is subject to few types but those of epithelial origin. As the process of tumour formation may afflict the teeth at any stage of their development three main types of epithelial odontoma are recognized; namely, fibrocystic disease of the jaw, dentigerous cyst and dental cyst. All these cause swelling of the jaw with considerable pain. All may be satisfactorily treated by excision.

FROM "THE CLINICAL DIAGNOSIS OF SWELLINGS" (THE WILLIAMS AND WILKINS COMPANY) BY COURTESY OF DR C E CORRIGAN

FIG 7.—A DENTIGEROUS CYST OF THE LOWER JAW

Fibroadenoma is a hybrid which, like fibromyoma, is of more common occurrence than each of its two "pure" composites. It consists of a mixture of white fibrous tissue and epithelial cells of a secreting gland. It is often multiple, usually painless, spherical in shape, firm in consistency and carries a thick capsule. Only two locations are commonly noted, the breast and the prostate gland.

It is the commonest tumour of the breast, where it must be differentiated from carcinoma—and vice versa. One or more tumours may be present in one or both breasts. It tends to develop before the age of 35. An outstanding clinical feature is the great mobility of the tumour within the breast tissue. Three varieties are described, hard, soft and cystic. The latter two may reach the size of a football but the hard type seldom exceeds the size of an orange.

Fibroadenomas have a small but definite tendency to become malignant. They should always be removed surgically as soon as they are diagnosed.

Adenomyoma and *fibropapilloma* are examples of rare hybrids. They assume the clinical features of one or the other of their constituent tumour tissues.

Diagnosis of Tumours.—Two main methods are commonly employed.

The first and oldest is that of clinical examination, an appreciation of the physical characteristics of the swelling, the symptoms it initiates, its site, its mode of growth and spread if any, and its effect on local and adjacent structures and functions. The success of this method depends essentially on the experience, skill and judgment of the physician. It may frequently be supplemented by X-ray studies of the part, notably in the case of tumours of the bones, intestinal tract and the more deeply seated lesions that cannot be directly seen or palpated.

The second method employed is the more scientific and accurate means of biopsy. Since all tumours consist of a new growth of cells, the microscopic study of these cells will give a true picture of the nature of the tumour. A bit of tumour tissue is therefore removed from the patient and submitted to histologic examination. This manoeuvre is employed where the diagnosis is in doubt, where the necessity of an extensive operation is being debated or where the method of treatment is in doubt. Some subvarieties of any one specific tumour may best be treated by operation, others by radiation or by a combination of both methods. Biopsy will usually provide the answer. While it constitutes the mainstay of accurate diagnosis it must be admitted that in some instances, notably in the case of near-malignant tumours, it may fail to clarify the diagnosis.

Occasionally adjuvant methods of diagnosis are employed. While there is no constant biochemical criterion by which tumours can be diagnosed, some of them, particularly of the adenoma group, will at times produce substances that alter the chemical and physical processes of the body in such a manner that the presence of a tumour may be inferred indirectly. By the study of these secondary effects alone the diagnosis may be established with certainty and an operation initiated for the purpose of searching for and removing the offending tumour, for example, an adenoma of the pancreas or the parathyroid gland.

The early diagnosis of tumours depends primarily on the patient who harbours one. Once having cause to suspect an abnormality he should pursue the matter of investigation as soon as possible. As mentioned above, some normally benign tumours tend to become malignant but this feature obtains only in cases where the tumour has been present for a long time. It is therefore obvious that early diagnosis is an essential factor in successful treatment.

Tumour Research.—The appalling loss of life caused by malignant tumours alone spurred world-wide efforts to unravel the mysteries of tumours. All aspects of the problem received meticulous investigation: the causation of tumours, their method of spread, factors which influence their growth and methods designed to eradicate them. The various fields of research include histology, biochemistry, physical chemistry, tissue culture, bacteriology, radiology, animal experimentation, surgery, clinical research, vital statistics and public health surveys. While notable advances were being made by mid-20th century, a satisfactory understanding of the problem was still lacking. It was not clear as to where the answer might be. The discovery of the cause, *e.g.*, might not yield the answer to the treatment, and vice versa.

BIBLIOGRAPHY.—E. T. Bell (ed.), *A Text-Book of Pathology*, 6th ed. (1947); William Boyd, *Surgical Pathology*, 6th ed. (1947); R. A. Willis, *Pathology of Tumours* (London, 1948). (C. E. Co.)

TUMULUS, an artificial mound of earth or stone, usually conical in shape, erected either as a memorial, or over the grave of a royal personage, noble or hero, or the relic of a saint. Funerary tumuli are sometimes known as barrows (q.v.).

TUNA, any of several fishes of the mackerel family, belonging to the subfamily Thunninae. They are typically large fishes,

of very robust body form, with a keel on each side of the caudal peduncle and with the pterotic bone excluded from the brain chamber by a deep pit or infolding behind the pro-otic bone. They are remarkable for maintaining their body temperature above that of the surrounding water and for having a peculiar vascular system, which is characterized by a large plexus along each side of the body. Most tunas inhabit warm seas, and many of them are circumtropical. They are believed to migrate extensively. Little is known about their biology. In the Atlantic ocean tunas spawn in the region of the Mediterranean.

They are among the most valuable food fishes in the world. Japanese fishermen, operating extensively through the western Pacific ocean, have caught about 460,000,000 lb. a year. California fishermen, voyaging as far as Ecuador, land an annual catch averaging around 158,000,000 lb, most of which is canned. Mediterranean fishermen contribute less than 10% of the world's total production of tunas. All the tunas are excellent game fishes. The best-known types are bluefin, or tunny (*Thunnus*), the albacore (*Germo*), the yellowfin (*Neothunnus*) and the skipjack, or striped tuna (*Katsuwonus*). (*See* also TUNNY.) (L. A. WD.)

TUNBRIDGE WELLS (ROYAL), a municipal borough and inland watering place of England, in the Tonbridge parliamentary division of Kent, 32 mi. S.S.E. of London by the S. railway. Pop. (1938) 32,620. Area, 9.4 sq.mi. It owes its popularity to its chalybeate spring and its beautiful situation in a hilly wooded district. The wells are situated by the Parade (or Pantiles), a walk associated with fashion since the wells were discovered. It was paved with pantiles in the reign of Queen Anne. A new assembly hall was opened in 1939. The town is built in a picturesquely irregular manner, and a large part of it consists of districts called "parks" occupied by villas and mansions. On Rusthall common about a mile from the town is the curiously shaped mass of sandstone known as the Toad Rock, and a mile and a half southwest is the striking group called the High Rocks. Five miles southeast is Bayham abbey, founded in 1200, where ruins of a church, a gateway and dependent buildings adjoin the modern Tudor mansion. The vicinity of Tunbridge Wells is largely residential. To the north lies the urban district of Southborough (pop 1938, 7,705). The industry known as Tunbridge Wells ware continued during 300 years, but the factory has closed and the small existing supply comes from the spare-time work of old hands. The ware includes tables, boxes, toys, etc., made of hard woods, such as beech, sycamore, holly and cherry, and inlaid with mosaic. Tunbridge Wells was incorporated in 1889. It owes its rise to the discovery of the medicinal springs by Dudley, Lord North, in 1606. Henrietta Maria, wife of Charles I, retired to drink the waters at Tunbridge Wells after the birth of her eldest son Charles. After the Restoration it was visited by Charles II and Catherine of Braganza. It was a favourite residence of the princess Anne before her accession to the throne, and from that time became one of the chief resorts of London society. In this respect it reached its height in the second half of the 18th century, and is associated with Colley Cibber, Samuel Johnson, Richard Cumberland the dramatist, David Garrick, Samuel Richardson, Sir Joshua Reynolds, Beau Nash and Mrs. Thrale (Hester Piozzi). The Tunbridge Wells of that period is sketched in Thackeray's *Virginians*.

TUNDRA, the cold, desert, treeless plains which form the Arctic lowlands of Europe and Asia. The name is also generally applied to a similar area in North America. The word is of Russian origin and means a marshy plain. The prevailing low temperatures are consequent on high latitude and proximity to the frozen northern ocean and result in very scanty vegetation.

TUNGABHADRA, a river of southern India, the chief tributary of the Kistna. It is formed by the junction of two streams, the Tunga and the Bhadra, which both rise in Mysore in the western Ghats. The united river for nearly all its course forms the boundary between Madras and the dominions of the nizam of Hyderabad. On its right bank stood the capital of the ancient Hindu dynasty of Vijayanagar, now a wilderness of ruins.

TUNG-CHOW, a city in the province of Hopei, China, on the banks of the Peiho, 12 mi. E. of Peiping. Its population is estimated at about 50,000. It is at the highest point of navigation of the Peiho, and is the port of Peiping. It is an old settlement known to the founder of the Han dynasty (206 B.C.) as Lu-Hien; under the T'ang dynasty (A.D. 618) its name was changed to Hüan-Chow, and at the beginning of the 12th century, with the advent of the Kin dynasty, Hüan-Chow became Tung-chow. Tung-chow, which was connected by light railway with Peiping, was headquarters of the puppet East Hopei Autonomous regime created in 1935, and a scene of early fighting in 1937.

TUNGKWAN, a Chinese fortress near the junction of Wei-ho and Hwang-ho. The way down the valley is hemmed in by great loess walls, sometimes on one side of the valley, sometimes, as at Tungkwan, on both. The Lunghai railway passes through Tungkwan, which was, from 1938 on, a key Chinese defense position against Japanese attacks from Shansi and Honan.

TUNG OIL. Two varieties are known, differng slightly in their physical properties, termed Chinese tung oil (China wood oil) and Japanese tung oil according to the country of origin. In China the oil is prepared from the seeds of *Aleurites cordata;* these are roasted in flat dishes over a fire, then coarsely powdered and expressed in primitive wooden presses. The kernels which contain up to 53% of oil yield in practice about 40%. The pale-yellow oil for exportation, known as "white tung oil" is obtained by expressing the seeds in the cold; the hot-pressed oil—"black tung oil"—is dark brown in colour and possesses a strong, unpleasant odour. Chinese tung oil has the highest specific gravity (0.940 to 0.944) of all known fatty oils, with the exception of castor oil, and the highest refractive index. The characteristic property of Chinese tung oil is the readiness with which it becomes polymerized, setting to a hard jelly on being heated for a short time to a temperature of 250° C. Polymerization is also induced by dropping saturated solution of iodine on to the surface of the oil, which immediately solidifies. The pronounced drying properties of tung oil render it suitable for use in the manufacture of paints and varnishes. In China it is further used for waterproofing paper. Tung-oil trees have been successfully introduced in the United States in the north-central part of Florida where more than 1,500 acres are planted. Up to 1939 all available seed was being used for planting. More than 100,000,000 pounds of the oil are imported annually and it is hoped that eventually the domestic supply will meet American needs. (*See* also OILS, FATS AND WAXES; and M. Toch, *Chemistry and Technology of Paints*, 1926.) (P. R. E. L.; G. H. W.)

TUNGSTEN. The name tungsten means "heavy stone" (Sw. *tung*, heavy, *sten*, stone), and directs attention to the high specific gravity of the element and its ores. (Symbol W, atomic number 74, atomic weight 184.0.) Up to the middle of the 18th century the mineral then known as tungsten, but now called scheelite, together with wolfram, were both considered to be ores of tin. In 1781, K. W. Scheele showed that this mineral contained a peculiar acid, which he named tungstic acid, combined with lime as a base, and in the same year T. O. Bergman advanced the opinion that the new acid was a metallic calx. Two years later the Spanish chemists, the brothers d'Elhuyar, proved that this acid was present in wolfram, and by heating the acid with carbon produced metallic tungsten for the first time.

Tungsten occurs in nature in the form of tungstates of iron, manganese and calcium, which may be divided according to their crystalline form into two groups. The iron and manganese tungstates, crystallizing in the monoclinic system, form the wolfram group, while calcium tungstate or scheelite belongs to the tetragonal system. Pure iron tungstate ($FeWO_4$) is known as ferberite and pure manganese tungstate ($MnWO_4$) as hübnerite. The mineral wolfram or wolframite is normally a mixture of these two compounds in varying proportions. Wolfram generally occurs in columnar, bladelike or massive forms, though sometimes it is found in well-formed prismatic or tabular crystals. It breaks up readily into thin flakes and its specific gravity ranges from 7.2–7.5. The colour may vary from nearly black to a brownish tinge characteristic of specimens rich in manganese. Scheelite or calcium tungstate ($CaWO_4$) may occur in the form of well-developed crystals which are usually double tetragonal pyramids, but frequently it is found in a massive form with four good cleavages.

The specific gravity is about six and the colour variable. It is generally gray, pale-yellow, or pale-brown, rarely green or reddish, with a waxy lustre. The world's principal supplies of tungsten ores have come from China, Burma, Japan, Australia, Bolivia and the United States.

Extraction and Manufacture.—The tungsten content of the ore as mined is usually 0·5 to 2.0%, so that a concentration process is necessary for extraction. The wolfram in the ore is associated with quartz and other gangue material, but it can be readily separated from these impurities owing to its high density. To remove cassiterite (SnO_2) which is present in a large proportion of wolframite ores, magnetic methods are employed. Wolfram, containing iron, is fairly magnetic, while cassiterite is not attracted as a rule even by powerful magnets. With scheelite, fortunately, the association of cassiterite is not common, otherwise (since scheelite is non-magnetic) chemical processes would have to be employed to effect the separation.

Many methods are available for the extraction of tungsten from its ores but the general principles involved in the extraction from wolfram may be illustrated by a brief summary of the sodium carbonate fusion process. The concentrate, after removal of cassiterite and other deleterious impurities, is mixed with excess of sodium carbonate and heated in a reverberatory furnace to about 1,000° C. in an oxidizing atmosphere. Thereby sodium tungstate is produced, and the iron and manganese present are converted to oxides:

$$4FeWO_4 + O_2 + 4Na_2CO_3 = 4Na_2WO_4 + 2Fe_2O_3 + 4CO_2$$
$$6MnWO_4 + O_2 + 6Na_2CO_3 = 6Na_2WO_4 + 2Mn_3O_4 + 6CO_2.$$

The soluble sodium tungstate is extracted with boiling water and on treatment with boiling hydrochloric acid an amorphous yellow precipitate of tungstic acid (H_2WO_4) is obtained which yields WO_3 on calcination. In the preparation from scheelite the finely ground ore is decomposed with hydrochloric acid, whereby calcium chloride passes into solution, and tungstic acid, together with insoluble impurities like silica, remains as a sludge.

$$CaWO_4 + 2HCl = CaCl_2 + H_2WO_4.$$

To purify the tungstic acid produced in these processes, it may be dissolved in ammonia and crystallized out as ammonium paratungstate, $5(NH_4)_2O.12WO_3.nH_2O$. This is decomposed by hydrochloric acid to yield purified tungstic acid, or ignited in air to tungstic oxide (WO_3).

Freedom from impurities and a suitable physical condition are absolutely necessary if tungsten is to be used for incandescent lamps or for wireless work. In this case, the method universally adopted for the preparation of the metal is reduction of the oxide by hydrogen, whereby the tungsten is obtained as a powder. For alloying purposes, however, where greater latitude is allowed in the amount of impurity and where the physical condition of the metal is of minor importance, the oxide is reduced by carbon and the resulting powder used for tungsten steels and other alloys.

The high melting point of tungsten precludes its industrial manufacture in the cast state from the powdered metal, and even if this were possible the product would be of little value as it would be both brittle and difficult to work mechanically. From the researches of W. D. Coolidge, who took out his first patent in 1906, a process has been developed which is capable of producing a fine tungsten wire that can be manipulated with little more difficulty than any other fine wire. In this process the powder is compressed in a hydraulic press into bars which are then heated to a high temperature in a furnace in an atmosphere of hydrogen, whereby a strong but brittle product results. This is now converted into rods by a mechanical hammering process in which the metal previously heated to 1,500° C. in an electric furnace in a hydrogen atmosphere, is subjected to 10,000 blows per minute in a special swaging machine. Further reduction of the diameter of the wire—usually from 1 mm.—is effected by drawing through dies. Tungsten wire can be drawn to 0.011 mm. diameter, while by immersion for 45 seconds in a fused mixture of sodium nitrate and nitrite at 340° C. a wire of diameter 0.014 mm. is uniformly reduced to 0.007 mm.

Physical and Chemical Properties.—Tungsten in the form of wire or sheet is dull white. The physical properties alter with changes in the structure of the metal, so that values for density, tensile strength, specific electrical resistance, etc., vary with the stage of swaging or drawing. The theoretical value for the density of pure tungsten, calculated from the atomic spacings, is 19·32. The probable melting point is 3,382° C., although the value 3,267°±30° C. is also quoted. Tungsten has the highest melting point of the metals. X-ray analysis shows that tungsten has a body-centred cubic lattice, the length of the cube edge being 3.155±0.001 Å. For further physical data, *see* C. J. Smithells, *Tungsten* (1926). Tungsten undergoes no appreciable oxidation on heating in air below red heat nor does it react with nitrogen, except when in the state of vapour. It is very resistant to the action of acids, neither *aqua regia* nor hydrofluoric acid attacking it to any appreciable extent. The best solvent for the fused metal is a mixture of concentrated nitric and hydrofluoric acids. Aqueous alkalis are without action but fused alkalis dissolve the metal.

Tungsten in its compounds exhibits valencies of 3, 4, 5 and 6, while, in addition, compounds of the empirical formula WR_2 (where R = Cl, Br or I) are known. In the case of chloride, however, the molecular formula is W_2Cl_6. The trioxide WO_3 is a bright canary-yellow powder which becomes dark orange when heated and fuses between 1,300°–1,400° C. It is insoluble in most acids including *aqua regia* but hydrofluoric acid dissolves it. With aqueous alkali hydroxides or carbonates it forms tungstates containing varying proportions of WO_3 to metallic oxide. A hexachloride and hexafluoride are known. The compounds $[WO_2Cl_2]$, $K_2[WOCl_5]$, $K_4[W(CN)_8]$ exhibit tungsten with co-ordination numbers of 4, 6 and 8.

Applications.—Tungsten finds wide application as a filament in electric lamps, and as it has a hardening effect on other metals with which it is alloyed it is a constituent of some of the most important industrial alloys. Tungsten steels are employed in the manufacture of cutting tools and permanent magnets. The stellite alloys containing cobalt, chromium and tungsten are extremely hard and are used for cutting tools and surgical instruments, as they are not affected by organic acids and ordinary antiseptics. Other uses of the metal include X-ray targets, thermionic devices, galvanometer suspensions, electrical contacts, refractory crucibles, etc. (W. Wa.)

TUNGSTEN STEEL. The earliest alloy of this type is Mushet steel (*q.v.*). It contains from 5.5 to 9.0% of tungsten and also carries enough manganese to give it air-hardening properties and to class it as a quaternary alloy. This article considers principally commercial ternary alloys of tungsten. High carbon steels containing tungsten up to 6% are essentially water-hardening steels. (*See* IRON AND STEEL: *Metallography and Heat Treatment;* METALLOGRAPHY.) The atoms of tungsten, being so much larger and heavier than those of iron, diffuse comparatively slowly in solid metal, so that a high temperature is required for solution before the quench. Accumulation of carbide particles upon tempering is also slow, hence the ability of tungsten steels to hold their hardness at high temperatures. Tungsten carbide also has a very high intrinsic hardness, approaching that of the diamond. For keen-edged tools tungsten in the alloy seems to prevent small particles from being torn away during use, and thus retards dulling.

Steel containing 0.9% carbon or more together with 1% to 2% tungsten is used for hack saw blades and for reamers, broaches and other tools which must show a minimum change in dimension after heat treatment. Steels with 1% carbon or more, and 3% to 7% tungsten, are much used for "fast-finishing" tools to cut hard metals or to make a fine smooth cut on softer tough metal. Dies for cold drawing wire and other shapes are made of higher carbon steels (2%) with tungsten ranging from 1% to 12%. Dies with the higher tungsten percentages are used for the harder metals or the finer wires. Chromium is often added to facilitate the diffusion of tungsten. When 0.5% or more is present the alloy may crack during water hardening. An oil quench, however, will harden it through to the centre. Chromium also causes the useful hardness to be retained at higher working temperatures. For working hot metal, tools would be made of 0.3% carbon steel with 10% tungsten and 3½% chromium (known as "semi-high-speed"). Permanent magnets for electric meters, magnetos, radio and telephone equipment absorb annually several thousand tons of steel containing 0.7% carbon and 5% to 6% tungsten.

In tungsten-iron alloys, substantially free from carbon, tungsten has the property of lowering the temperature at which delta iron changes to gamma iron and also of raising the temperature at which gamma changes to alpha iron. Consequently, the American metallurgist W. P. Sykes was able to show that no gamma iron is formed in carbon-free alloys containing more than 7% tungsten. Such an alloy is permanently austenitic, and cannot be hardened or tempered by heat treatment. In the alloys containing more tungsten the compound Fe_3W_2 appears; its solubility decreases with the temperature, and it is precipitated throughout the metal at a slow rate. To harden such an alloy it is necessary to anneal or "age" it at a moderate temperature for several hours or days. Brinell hardness numbers indicate the extent of this action:

	Brinell
Carbon free iron	70
Carbon free solid solution alloy, 80% iron, 20% tungsten	160
Above after aging	330
Carbon free aged alloy, 78% iron, 22% molybdenum	530

Such aged alloys of iron and tungsten and of iron and molybdenum (tungsten and molybdenum being very similar chemically) form excellent wire drawing dies, and have given 10 to 40 times the service that can be had from best high speed steel before the edge needs re-dressing. (*See* IRON AND STEEL; HIGH SPEED STEEL.) (E. E. T.)

TUNGUSES, a widespread north Asiatic people. They are the *Tung-hu* of the Chinese, probably a corrupt form of *tonki* or *donki*, that is, "men" or "people." The Russian form *Tungus*, wrongly supposed to mean "lake people," appears to occur first in the Dutch writer Massa (1612); but the race has been known to the Russians ever since they reached the Yenisei. The Tungus domain stretches from long. 60° E. to the Pacific ocean and from the Arctic to the Chinese frontier. The Tunguses are known to the Samoyedes by the name of *Aiya* or "younger brothers" The Oroches, Chapogir, Golds, Lamut, Manjour, Manegre and Oroke are partly in Manchuria and are Tungusic. The Tungus type is essentially Mongolic, with broad flat features, small nose, wide mouth, thin lips, small black and somewhat oblique eyes, black lank hair, dark olive or bronze complexion, low stature, averaging not more than 5 ft. 4 in. The square shape of the skull and the slim, wiry, well-proportioned figure are features especially of the typical Tunguses They are classed according to their various pursuits, as Reindeer, Horse, Dog, or Sedentary, Nomadic and Wandering Tunguses. A few have become settled agriculturists; but the great bulk of the race are still essentially forest hunters, using the reindeer both as mounts and as pack animals. Nearly all lead nomad lives in pursuit of fur-bearing animals, whose skins they barter in exchange for provisions, clothing and other necessaries of life. The national costume shows in its ornamentation and general style Japanese influence, due to intercourse at some period previous to the spread of the race to Siberia. Many of the Tungus tribes are reckoned as "Greek Christians"; but most of them are still Shamanists and nature worshippers, secretly keeping the teeth and claws of wild animals as idols or amulets, and observing Christian rites only under compulsion. Family and exogamic clan organization is relatively strong. Intercourse begins before marriage as soon as a portion of the bride price has been paid. Some practise polygamy. Exchange marriages occur. The levirate is common. A man may take his son's widow. Cousin marriage occurs and tree burial (*q.v.*) is found among them.

See M. Czaplicka, *Aboriginal Siberia* (1914).

TUNICATA. Tunicates are exclusively marine animals, related to vertebrates and therefore sharing with man a common but primevally ancient lineage. They are common, cosmopolitan, frequently seen but rarely noticed since for the most part they are fixed growing organisms resembling more a potato than a fish. Yet, at some time in the career of each individual it is provided with the forerunner of a backbone, a uniquely dorsal tubular spinal cord found nowhere among invertebrate animals, and similarly distinctive gills. Of these features, equally typical of the early human embryo, only the last usually survives into the adult animal, and mature tunicate animals in general are permanently attached forms with no capacity for locomotion, using an enlarged and elaborate gill system as a means of filtering large volumes of sea water for the sake of its contained microscopic life. As the name implies, a tunic is secreted by the skin which not only helps to anchor the animal to some solid structure but gives rigidity to its outer form, and allows the delicate inner organism to suck in and filter sea water to its heart's content. Many tunicates are solitary individuals growing to the size of an orange, but like most kinds of animals that have given up freedom of movement for a sedentary life, many have become colonial forms in which the individual becomes subordinated to an organic community.

Tunicates virtually are universally distributed throughout the seas of the world, from the intertidal zones down to the deep abyss, and inasmuch as certain types have given up a fixed existence for a drifting, floating life, the vast expanses of the open ocean are also inhabited by these forms. The more primitive group, associated with the sea bottom, is known as the ascidians, or sea squirts, and may be found along or near the shore of all the seven seas, growing on seaweeds, on or under rocks, in submerged sand flats, on coral reefs, submarine cables, ship bottoms, wharfpiles, and even on the shells of elderly lobsters and sea snails. They abound from polar regions to the tropics. Some species are cosmopolitan, found from Spitsbergen to Cape Cod, Naples to Singapore, others so limited as to be known only from grottos on a Brittany beach, or the Kerguelen Islands of the southern Indian ocean.

The group has many peculiar and fascinating features. Alone among animals it secretes its coat of *tunicin*, a substance almost identical with the ever-present cellulose of the plant kingdom. It has a heart similar to that of a chick embryo a few days after the onset of incubation, but unlike the chick heart the tunicate's reverses the direction of its beat periodically. Its blood is unique. While the blood has no respiratory pigment and can carry no more oxygen than a similar amount of sea water, it is frequently rich in both sulphuric acid and the rare element *vanadium*, substances more associated with the production of steel than body fluids. Not only are individuals hermaphrodite, that is, possess both ovaries and testes, but in many cases the same final organism can be produced either by a fertilized egg or by the growth and reconstruction of a fragment of adult tissue. Lastly, as the name of one genus, *Pyrosoma* or firebody, implies, some are brightly luminous at night, *Pyrosoma* appearing as a glowing candle-shaped body drifting through the surface waters of warm oceans.

The great French anatomist, Georges Leopold Cuvier, at the beginning of the 19th century placed ascidians with his "headless molluscs" the bivalves, and the class was named and defined by the evolutionist Jean Baptiste Lamarck in 1816, although the chordate nature and therefore the relationship with vertebrate animals was not recognized until many years later. Only after Charles Darwin's great theses on evolution had been published and become widely known, was it discovered that the sedentary sea squirts produced eggs that developed not directly into miniature sea squirts, but into tiny tadpoles of the same basic organization as the tadpole of the frog.

Life Cycle.—Ascidians are hermaphrodite animals, each individual producing both eggs and sperm, in many cases being able to fertilize their own eggs, in others unable to do so and cross-fertilization is obligatory. Most solitary ascidians produce small eggs in large numbers, each being surrounded by buoyant follicle cells which enable it to float away in the currents while development proceeds. The early developmental patterns, while on a small scale and also condensed in time, resemble closely those of primitive vertebrates and are unlike those of any invertebrate animals. This development leads directly to the formation of a minute swimming tadpole. In the case of these widely disseminated eggs the tadpoles are quickly formed—long before they are capable of feeding. They are equipped for swimming to the sea surface, at least for a few critical hours. Each possesses a tail for swimming consisting of a central supporting rod of cells, the notochord, which all vertebrates, including man, possess at some stage in their individual development as the immediate precursor of a vertebral column. In the case of ascidians, however, the development stops there. On either side of the notochord is a band of muscle fibres equivalent to the locomotory muscles of a fish, while a narrow tubular spinal cord overlies the notochord throughout its length. These features and their combined organization are distinctive of all vertebrate and chordate animals and definitely link ascidians and other tunicates with the main evolutionary line leading eventually to man himself, in spite of the obscure and bizarre appearance of the adult forms.

In the tadpole, the nerve tube expands in front as a small brain vesicle typically containing two sense organs. These enable the tadpole to orientate and swim towards the source of light, the sea surface, and away from the centre of gravity, away from the sea bottom. They represent an eye and an organ of balance in their simplest form.

The existence of such a tadpole ensures a wide dispersion of the species, compensating for the immobility of the adult. This purpose is served, however, after a few hours, and then degenera-

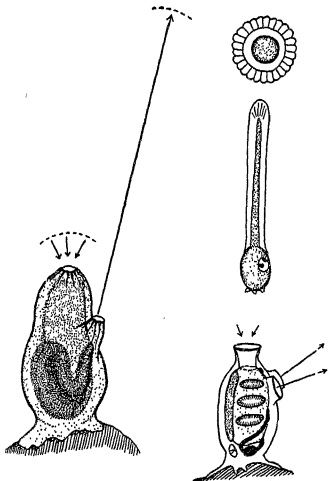


FIG. 1.—THE LIFE HISTORY OF AN ASCIDIAN

At the left an adult solitary ascidian of the genus *Ascidia* attached to a rock. The gill chamber and looped intestine show through the transluscent protective tunic. The solid arrows indicate the direction and extent of the ingoing and outgoing water currents. At the right is the egg with its outer layer of buoyant flotation cells, the tadpole that develops from it with swimming tail, orienting sensory apparatus, and three adhesive papillae; and, beneath, the organism following the metamorphosis of the tadpole, namely, a young ascidian with three pairs of gill slits, intestinal loop and heart below, and brain lying between the siphons

tive changes commence in the tadpole organization. It sinks toward the sea bottom, the tail becomes immobile, and the tadpole becomes attached by three adhesive structures on its nose to any solid structure sufficiently clear of soft mud. With the tadpole anchored, the tail absorbing somewhat as in the case of the frog, development continues through this period of metamorphosis to form the first stage capable of feeding. This consists of a small barrel-shaped animal attached by what was originally its chin region, with a large funnel-like mouth facing upwards and allowing water to flow into a capacious pharynx or throat. This bears gill slits on each side through which the water passes into a surrounding chamber opening externally by another funnel. These funnels are called siphons, inhalent siphon and exhalent siphon respectively, and are characteristic of tunicates in general.

In essentials the adult ascidian differs from the newly attached feeding individual in little more than increased size and the acquisition of sex glands. The existence of two such different types of organism as the ascidian tadpole and the ascidian adult has afforded the basis of much argument. Either the tadpole is a relic of a more aristocratic chordate ancestry and the adult represents a degenerate sacrifice of motility, or the attached adult is the more primitive type and the tadpole the newcomer. The first of these interpretations was the first to be adopted and is the orthodox view, the other is more recent and in many ways more plausible, but its implications concerning the origin of vertebrates are startling.

The typical ascidian is essentially a large sac corresponding to the throat region of a fish, into which leads the large inhalent siphon or mouth opening. The water taken in is strained through innumerable gill slits on each side of the sac, escaping into an external chamber leading to the exterior by way of the exhalent or atrial siphon. The remainder of the digestive canal is narrow and leads from the lower end of the gill chamber. It consists of an oesophagus, a simple stomach, and an intestine looped up to open close to the outlet of the exhalent siphon. In its loop the hermaphrodite sex gland is usually to be found. Close to the loop is a simple heart. A solid nerve mass, or "brain" lies between the two siphons, with nerves extending to each.

The reactions of the animal are practically limited to a swift closing of the siphons. At the base of the inhalent siphon a ring of tentacles prevents the passage of any particles too big to be managed, contact with the grid of tentacles producing the contraction reflex, and such a particle is rejected. Otherwise reactions are limited to mild responses to light stimulation.

Feeding Mechanism and Other Systems.—The mechanism for obtaining food is remarkable, both for its elaborate efficiency and for its ultimate evolutionary fate. The feeding mechanism consists essentially of two components, the production of mucus for the entanglement of food particles, and the production of a water current bringing in those particles. The water current streaming in through the inhalent siphon is produced by the outward-beating cilia (protoplasmic hairs) lining the numerous gill slits in the wall of the pharynx. On passing through these minute slits the water converges in the surrounding atrial cavity toward the exhalent siphon. It shoots out through this opening to a considerable distance, so that the water exhaled is not drawn in again

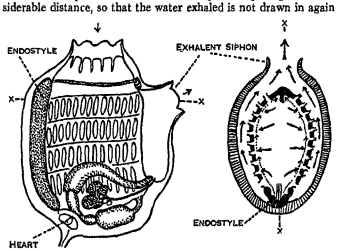

FIG. 2.—STRUCTURE AND FEEDING MECHANISM OF AN ASCIDIAN (GENUS PEROPHORA)

Solid arrows show direction of water currents, dotted arrows the direction of mucus transfer. Diagram at right represents a horizontal section at the level x——x of the individual shown at the left. Water flows in through the mouth past tentacles into the gill chamber and flows out through four rows of gill slits in each wall into the surrounding protective outer chamber, finally to the exterior by the exhalent siphon. Food particles are trapped by mucus, secreted by a deeply-grooved band (the endostyle, the forerunner of the thyroid gland of man), which passes up the inner walls of the gill chamber. The particles are passed into and digested by the looped intestine lying at the base of the gill sac. The combined reproductive gland, ovary and testes, lies within the loop formed by the intestine

through the mouth. The water entering the gill chamber contains small living plant and animal organisms suitable for food. These are trapped by the endostylar mechanism. The mechanism consists of a mid-ventral groove, the endostyle, extending the whole length of the gill chamber, and a band of similar tissue extending around the anterior end immediately behind the anterior ring of tentacles. The groove and band consist of glandular tissue secreting mucus or slime in strands into the main cavity. Food particles encountering the strands are entangled and the cords of slime and organisms are wafted toward the upper side of the chamber. Along the mid-dorsal line the cords are rolled into a single cord with the aid of the dorsal membrane, and the cord passes back to the

oesophagus. Passing through the oesophagus the cord reaches the stomach, is mixed with digestive enzymes and travels slowly through the looped intestine until the indigestible remnant emerges near the base of the exhalent siphon. Here the strong outgoing current carries away the faecal matter to a safe distance.

The food collecting apparatus as just described may become more elaborate in some, simplified in other forms of tunicates, but basically the system is the same in all. The same system is well developed in another chordate, *Amphioxus*, and even more significantly in the young of the lamprey, a true vertebrate. The adult lamprey, however, feeds in an entirely different manner and the greater part of the endostylar apparatus degenerates when the lamprey is about 6 in. long, except for the middle region of the endostylar groove itself, which emerges as the thyroid gland, the metabolic governor of all later vertebrates.

The blood and its circulation is of interest for several reasons. The pattern of blood vessels foreshadows that of the fishes. A large vessel passes from the heart forward beneath the endostyle, lateral vessels leave this and pass up the sides of the gill chamber to meet above in another longitudinal vessel. The heart itself is a tube folded lengthways within itself and has the unique property of periodically reversing the direction of its beat. After waves of contraction pass along it in one direction about 50 or 60 times, it slows to a stop and a new set of contractions begins, starting from the opposite end. The reversal is independent of any external nervous control. The blood is free to circulate in either direction owing to the absence of any valves limiting direction as they do in all vertebrates.

The blood itself is also peculiar. It transports no more oxygen than an equivalent amount of pure sea water and contains even less carbon dioxide. No respiratory pigment is present or necessary owing to the relatively enormous surfaces exposed to flowing water. At the same time pigmented cells are usually present in the circulating fluid and contain oxides of vanadium and free sulphuric acid. In certain solitary ascidians vanadium oxides may amount to as much as 15% dry weight of the blood, in spite of the fact that vanadium can barely be detected in sea water even by the most modern methods. How it is extracted by the animal and what part it plays in the activities of the organism are unknown. The sulphuric acid is also puzzling. Its presence is apparently associated—and probably its function as well—with that of vanadium. Apart from this it is difficult to understand how cells can tolerate within themselves a strong acid in a concentration sufficient to kill animal tissues in general.

Excretion of waste materials, especially the breakdown products of protoplasm itself, is managed in strange ways. Urates are deposited as solid concretions in sacs isolated within the body either single and large, or small and numerous, as permanent depositories. Other waste substances are eliminated at the external surface of the tunic. The tunic itself consists of tunicin, a substance closely allied with cellulose and secreted by cells characteristic of the middle body layer that have actually migrated through the outer skin to form a connective tissue in a most unusual place.

A tunicate could not be itself if it were not ambiguous. To complete the picture, there is a duct which passes from a glandular mass situated beneath the brain and opens by a ciliated funnel at the front and dorsal corner of the gill chamber. The structure of this apparatus and the nature of the cellular material passed down the duct to mix with the incoming water current indicate clearly that it is the homologue of the pituitary gland of vertebrates, the master gland of the body governing the endocrine glandular system as a whole. What the function is in the tunicates nobody knows.

Reproduction.—Tunicates have evolved in various directions not only as mature adult organisms but also in two other ways. The tadpole larvae vary remarkably in detail, while the faculty of reproducing nonsexually by the production of buds of various kinds has been evolved in some forms to a remarkable extent. The more elaborate types of tadpoles are relatively large with a relatively complex nervous system, beating heart and complex gill chamber almost ready for active life. In spite of such complexity, however, these tadpoles may have a free-swimming life of only a few minutes, being designed primarily for the selection of limited and specialized habitats upon which to settle, in the immediate neighbourhood of their parents. They are also associated with viviparous forms, that is, the eggs are retained in the atrial chamber or in some special brood pouch and develop there safely at least until the tadpole stage is reached. Wide dispersion of the species by the usual means of oceanic currents is sacrificed to a maintenance of the population in local territory together with the selection of a specialized niche. The brevity of free-swimming existence not only limits the extent of distribution but greatly reduces the chances of any particular tadpole being eaten. In other words a relatively small number of large eggs are given a high degree of protection in several ways that ensure their survival to a comparatively advanced stage. This is in contrast to disseminating large numbers of small eggs to develop unprotected over a protracted period in the currents of the sea.

Viviparity, generally speaking, is usually associated with types able to reproduce also by budding. The plantlike method of reproduction, asexual reproduction or gemmation, is characteristic of many ascidians and has apparently arisen within the sea squirts on at least three separate occasions. It is a reproductive method very usual among nonmotile animals. If the tunicates as a whole are included, a fourth case of independently evolved budding should be added.

Budding is essentially a separating off, either physically or physiologically of a fragment of a mature or of a developing individual itself. The processes involved are essentially those involved in the regeneration of missing parts, a capacity tunicates have to a very marked degree. The nature of budding varies considerably among the different orders of tunicates, but in virtually every case it is due to some form of constriction by the epidermis which divides the contained tissues into separate masses, the nature of the whole isolated mass depending on the nature and part of the particular tunicate involved. The process is usually associated with the presence of reserve food storing cells known as trophocytes. These are produced in large numbers especially in those forms that undergo a winter regression. The main growing

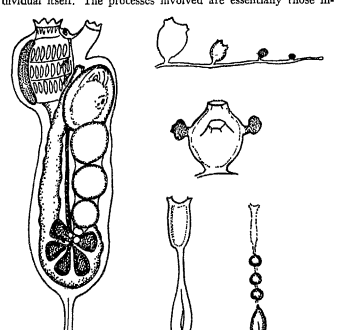

FIG. 3.—VIVIPARITY AND BUD FORMATION

Left: an individual (genus *Eudistoma*) with its intestinal loop extended posteriorly from the gill chamber shown with its ovary and testes still in the bend of the intestine, although the eggs are shown developing to the tadpole stage within the expanded oviduct. Upper right: buds are shown developing from a creeping stolon (*Perophora*), at the middle right buds develop from the lateral body wall of the parent (*Botryllus*), and at the lower right are two individuals (*Diazona*), one in functional form and one transformed into a string of living beads, each one of which is destined to form a new individual

season naturally coincides with the spring and summer when the microscopic food organisms are abundant in the sea. In the early winter the food supply dwindles and many ascidians degenerate In such as these the disintegrating tissues are absorbed by wandering reserve cells which subsequently migrate toward the base of the individual. There the epidermal constructions divide the congested contained mass of reserve tissue into small masses or buds capable of surviving the winter and developing into new individuals in the spring. This type of budding leads to the formation of the group known rather loosely as the social ascidians, where many individuals of a common egg parentage are closely clustered together and may even become imbedded in the same glutinous external tunic. In others the buds may remain partly attached to the parent and either in connection with their parents or with other individuals of their own bud generation develop community systems of blood vessels and exhalent siphons. These are true animal colonies in which the individuals are actually subordinated to the activity of the whole.

Tunicates can be large and solitary, or small and aggregate or colonial, that is, growth can be expressed in either of these two ways but not both ways at the same time. It is the small individuals of the social and colonial forms that have departed from the production of large numbers of widely disseminated small eggs, and have evolved to a high degree the practice of viviparity or bearing their young alive.

Viviparity in ascidians is apparently easily attained and there is no doubt that among them it has been acquired independently on many occasions. All openings of the body proper, namely gill slits, anus, oviduct and sperm duct, open not directly to the exterior but into the atrial cavity, reaching the outside finally by way of the exhalent siphon. In egg-laying forms the reproductive ducts together with the intestine reach almost to the base of the exhalent siphon, and the outgoing stream of water carries all the products immediately away from the body Accordingly all that is necessary for the retention of the eggs is a shortening of the oviduct so that they remain in the lower part of the atrial cavity, bathed by the water flowing through the gill slits. Increase in individual egg size ensures that under these circumstances the eggs will not be carried away by the water current, while the fact that the animals are hermaphrodite ensures fertilization and subsequent development of the retained eggs. When the tadpole stage is reached they swim away. This description applies to the majority of viviparous ascidians, but some are more specialized, such as *Distaplia*, and fertilized eggs are actually retained within the oviduct, which may bulge out from the side of the body as a distinct brood pouch While in *Botryllo*ides the egg is fertilized actually within the ovary, the tadpole escaping finally by bursting through the body wall

While in many cases the presence of budding is little more than a process of reproduction, that is, increasing the number of individuals in a local population, in others there is a considerable degree of organic continuity and co-operation so that a superorganism is formed and the individuals are subordinated to it The secretion of the external collagenous tunic plays an important part in this phenomena. The outer epidermis of different individuals remains distinct as in other forms of animal life, but the tunic secreted by adjacent individuals, if close enough together fuses into a compact whole Budding therefore is always likely to result in numerous individuals becoming imbedded in a common mass of tunic material. This is the basis for a true colonial system. Individuals arrange themselves into systems or groups with, for example, all exhalent siphons converging toward a common centre to unite in forming a cloacal chamber and outlet. This condition frequently occurs In a few types, as in *Botryllus* or *Symplegma*, buds remain in functional continuity with the circulatory system of the parents so that a colonial circulatory blood system is formed. Such a circulatory system within a mass of tunic survives though individuals associated with it may come and go as they each live through their individual cycles.

Selection of Habitat.—The form of solitary and colonial ascidians is closely adapted to the various types of possible habitats, or, to put it conversely the various special marine habitats are populated by ascidians that are able to survive in and exploit such niches

Solitary ascidians are generally relatively large as individuals, with all three spatial dimensions well represented. They need plenty of room They are to be found chiefly either attached to the surfaces of rocks, piles or ship bottoms, or imbedded in submerged sand or mud flats Attachment is made by the growing external coat of tunicin, with its contained vascular processes. In quiet, more or less protected waters, such as harbours, estuaries, or relatively deep water, attachment is usually by the posterior end with the siphons reaching out into the water, as for example, *Ciona intestinalis*, the most cosmopolitan example of them all. Where there is considerable wave action, attachment is usually by the whole of one side. Some species are of but one habit or the other and are consequently limited in their range, while others, of which *Ciona* is as good an example as any, vary their attachment according to circumstances and occur in a diversity of habitats. In two families of ascidians, however, species have forsaken an attached abode for the sifting sand, mud, or shell gravel of the sea floor of the continental shelf. These are molgulids and polycarps, and in order to maintain their anchorage in such an unstable environment, they are large, more or less spherical, and have innumerable hairlike extensions of the tunic to which sand grains or shell particles adhere, the whole being submerged in the sand except for the emergent siphons. Sand or shell particles adhere also to the siphons and the animals are in consequence perfectly camouflaged. At certain depths of the continental shelf and coastal inlets extensive beds of mud, sand, or shell gravel of suitable consistency occur and these large and more or less globular species of the genera *Polycarpa* and *Molgula* are found in enormous numbers. The sea bottom habitat and its great extent has apparently made it less desirable to send tadpoles wriggling to the surface of the sea, and in these genera the tadpoles have independently allowed their eye to degenerate, being responsive only to the force of gravity, while in many species of sand-living molgulae, not only the eye of the tadpole, but its gravitational organ, the otolith, and the tail itself are lost. The effect is that large numbers of developing eggs are scattered over the sea floor where there is abundant room.

Budding or compound ascidians on the other hand are conspicuously unable to survive in such places, and for the most part are attached to relatively flat surfaces over which a good but not violent supply of clean water is assured

Reproduction by budding, while leading to the formation of a colony unit rather than many separate individuals, has naturally an effect on the size of the individuals. An individual ascidian can either remain solitary and grow to a large size, or its growth is expressed in the formation of numerous individuals which repeat the budding process, thus increasing in number but hardly at all in individual size. If the process of budding is not too highly developed the individuals of a colony may be of a moderate size and number, and usually separate from though in contact with one another. These are often grouped together as the "social" ascidians to distinguish them from the "compound" forms that are more truly colonial. This grouping is not a natural one and brings together such distantly related types as *Clavelina* and *Stolonica*, genera which belong to different orders of ascidians The individuals being, however, of fair size need a corresponding amount of space, and in general this group is found attached to protected submerged rock ledges, to the anchoring processes of large laminarian seaweeds, or to the surface of corals and sea fans.

Where budding is more active, the individual size is reduced and the numbers increased, tending to create a virtually two-dimensional colony. Colonies such as these are often large in area though of little thickness, with relatively minute constituent individuals. Together with bryozoans and certain sponges they tend to form an encrusting film over the underside of rocks, coral crevasses, stalks and fronds of seaweeds, and solitary ascidians, for the most part in the highly diversified environment of coastal waters, lagoons, mangrove swamps, rocky shores, estuaries and the intertidal zone itself. As long as the water flows freely bringing life-sustaining oxygen and microscopic food organisms this

type of ascidian colony in general occupies a two-dimensional world of highly specialized niches In relation to this and to the small size of the composing individuals, such organisms produce a comparatively elaborate form of tadpole larvae. The small bulk of a colony and particularly of an individual results in a correspondingly reduced capacity to produce eggs When egg numbers are reduced below a critical value it becomes increasingly important to ensure the survival of an adequate number of those that can be produced If large numbers cannot be produced it is better to produce a very few with a great chance of surviving to maturity than a moderate number with little chance In any case the compound ascidians characteristically form a very small number of relatively large eggs that develop to the tadpole stage within the protection of the parental atrium or oviduct Once liberated the best chances of the tadpoles of survival is attachment to surfaces similar to that of the parent and therefore in the near neighbourhood. Again in any case the tadpoles are not only good swimmers because of their relatively large size, but are also better equipped with sensory and hold-fast mechanisms so that some selection of a particular type of abode is possible; limiting their range to local territory, the length of the free-swimming period is reduced from the more primitive duration of one or several days to a mere few minutes This form of adaptation has taken place in a number of unrelated families of ascidians independently, for example, *Botryllus, Perophora, Amaroucium. Clavelina* and *Didemnum*

Colonial ascidians in particular are frequently brightly coloured with yellow, brown, red, green, and even blue pigments, while in some the constituent individuals become grouped in small star-shaped systems. (*Botryllus*), ladderlike rows (*Botryllooides*) or rosettes (*Polyclinum*).

CLASSIFICATION

The ascidians are but one of three orders of tunicates, the remaining two being oceanic orders.

Ascidians have been classified in various ways, but primarily with regard to the position and nature of the reproductive glands, and according to the nature of the branchial or gill structure If the primitive type is considered to be relatively small with a moderately elaborate gill apparatus and an intestine looped beneath it and up one side toward the exhalent siphon, diversification within the order has been mainly in two directions The intestinal loop may remain in this position while the branchial region is elaborated, or the branchial region may remain simple, but the intestinal loop together with the heart and reproductive glands descend down the attachment stalk

Edmond Perrier divided the ascidians into Enterogona and Pleurogona, the Enterogona having the gonads or reproductive glands situated either within the intestinal loop or extending posteriorly from it, but in any case only a single unit of ovary and testis being present; the Pleurogona having gonads on each side of the body and extending into the outer wall of the atrial cavity. The division according to branchial structure was made by Fernando Lahille and later by Oswald Seeliger into three suborders, the Phlebobranchia with accessory longitudinal blood vessels internal to the branchial wall, the Haplobranchia without such vessels, the two suborders corresponding to the Enterogona; and the Stolidobranchia, corresponding to the Pleurogona, with internal longitudinal bars, in place of tubular vessels, the branchial wall usually being thrown into a series of folds.

The following is a synopsis of the group.

Class TUNICATA

Order I. ASCIDIACEA. Attached forms with dorsal exhalent siphon, branchial region (pharynx) with transverse rows of ciliated gill slits.

Section Enterogona Gonads on one side only, either within loop of intestine or projecting beyond it posteriorly.

Suborder 1. PHLEBOBRANCHIA (DICTYOBRANCHIA). With internal longitudinal tubular vessels Families: Cionidae, Perophoridae, Ascididae, Corellidae, Diazonidae.

Suborder 2. HAPLOBRANCHIA (KELKOBRANCHIA). No internal longitudinal vessels or bars. Intestinal loop always extends posteriorly into stalk Families: Clavelinidae, Polyclinidae, Didemnidae.

Section Pleurogona. Gonads usually paired, and in atrial wall.

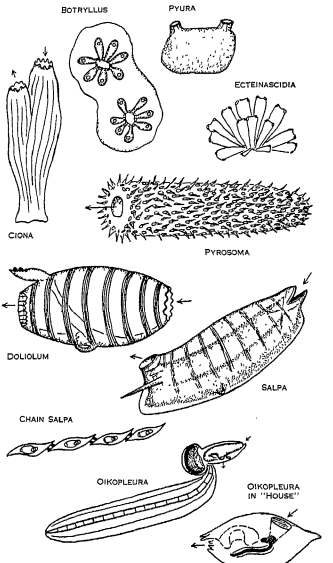

FIG 4.—TUNICATES

Examples representing the classes Ascidiacea (all attached forms—the solitary *Cionа* and *Pyura*, and compound *Botryllus* and *Ecteinascidia*), Thaliacea (floating oceanic forms—the colonial *Pyrosoma*, both solitary and chain forms of *Salpa*, and *Doliolum* with buds forming on its dorsal spur), and Copelata (permanent tadpolelike forms—*Oikopleura*, with and without its temporary feeding "house"). Arrows show direction of ingoing and outgoing water currents

Suborder 3. STOLIDOBRANCHIA (PTYCHOBRANCHIA). With internal longitudinal bars and wall of pharynx folded longitudinally to create greater filtration surface. Families: Pyuridae, Molgulidae, Styelidae, Botryllidae.

In addition to the order Ascidiacea, the tunicates comprise two others, the order Thaliacea and the order Copelata These are unattached forms inhabiting the oceanic currents, delicate transparent organisms not often seen but occurring in great numbers. The first of these is divided into three suborders, all members of which reproduce by budding to form colonies at some period of their life. The Copelata never bud and are permanently tadpole-like.

Order II. THALIACEA. Oceanic (pelagic), with inhalent and exhalent siphons at opposite ends of body; with long simple gill slits instead of rows of small gill slits.

Suborder 1. PYROSOMATA. Colonies form hollow floating tubes open at one end only, individuals being imbedded in the wall of the tube with their inhalent siphons extending from the outer surface and their exhalent siphons opening into the hollow interior of the colony. Eggs large, no tadpole larva being found Family: Pyrosomatidae

Suborder 2. DOLIOLIDA Primary individual nonsexual, reproducing by budding. Budded individuals become sexually mature. Recognizable

tadpole stage formed, but is temporary. Families. Doliolidae, Dolioplidae.

Suborder 3 SALPIDA. Primary individuals nonsexual, reproducing by budding Buds form a long chain, sometimes in form of wheel, and function before being liberated Eggs attached to parent and tadpole stage absent Families. Salpidae, Cyclosalpidae

Order III COPELATA Small oceanic forms with permanent tail, internal structures simplified, peculiar tunic house formed in relation to feeding mechanism. Families Appendiculariadae, Fritillariadae, Kowalevskiidae.

Both the Thaliacea and Copelata show adaptation to a pelagic existence in the upper layers of the ocean. *Pyrosoma* is the least modified and is essentially an unattached, floating colony, and is highly luminous It glides slowly through the water by means of the water currents passed by each constituent individual into the hollow interior of the colony. The accumulating water escapes through the open end of the tube and the colony moves slowly in the opposite direction by a weak form of jet propulsion.

The Salps and Doliolids have given up producing water currents through their interior by means of ciliary activity and have substituted muscle contraction Bands of muscle more or less encircle the body of an individual and their contractions force water through the barrel-shaped organism, thereby drawing the animal through the water

The Copelata on the other hand retain the tadpole tail as the organ of locomotion At times the action of the tail causes the animal to swim through the water, but most of the time there is present an external "house" of tunicin—secreted by the epidermis —which floats or drifts along, and the activity of the tail causes water to flow through it and from which microscopic food organisms can be filtered.

The relationship of the tunicates to chordate animals as a whole, and therefore to vertebrates and finally man, has been the subject of much speculation ever since the existence of a chordate tadpole was first discovered The first and Haeckelian interpretation was that the tadpole represented a relic of an ancient descent from an early vertebrate animal, the adult tunicate being in a sense highly degenerate, the tadpole being retained in the course of the development of the egg in conformation with the theory of recapitulation or biogenetic law. This view was universally held until the 1920s, and was relatively comfortable, for it accounted vaguely for the existence of the tunicates themselves as a by-product and at the same time threw no slanderous aspersions on the origin of the chordate-vertebrate group of animals as forms which from the beginning swam in the light of the sun near the ocean surface, never descending for an apprenticeship on the plebian sea floor. Such a habit was supposed to account for the uniquely dorsal position of the nerve cord in vertebrates in contrast to the ventrally placed cord of belly-crawling invertebrates

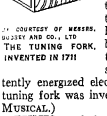
An alternative interpretation, however, appears to fit the facts better, a view first presented strongly and plausibly by Walter Garstang in 1928. This considers the attached ascidians to be of primitive habitat. Not present-day ascidians, but their ancestors of very ancient times, probably more than 1,000,000,000 years ago in the upper pre-Cambrian era, are thought to have been relatively small simple forms attached to the sea floor There they evolved a dorsal nerve mass for controlling the siphons: gill slits evolved for the escape of the food-bearing current, and a ventral heart to pump the blood Their eggs developed at first into simple larvae swimming by means of cilia like the larvae of most primitive marine groups From this originally simple larva the ascidian tadpole gradually evolved

No direct evidence can ever be obtained concerning the evolution of the tiny delicate organisms of pre-Cambrian times, but circumstantial evidence abounds and strongly supports this later theory concerning the origin of tunicates If valid, then not only are the thaliacean tunicates colonial forms that have abandoned a sessile for a pelagic life, but the Copelata, which at one time were thought to be the most primitive of tunicates, are considered to be descendants of the Thaliacea and in no way primitive forms.

If the tunicates were merely an isolated group of animals with no self-important relatives, the more plausible of two theories would be readily and more or less indifferently accepted. But somewhere near the level of tunicate organism are the remote beginnings of human evolution itself and the last theory directs the line of descent into and through the group instead of making a detour around into the great unknown In effect, the great group of vertebrate animals would have their origin in the enterprising young of a group of tiny water filterers cemented posteriorly to the sea floor

This is not implausible. Evolution does occur in relation to any stage in the life cycle of an animal, and larval types are known to have become the sexually mature adults. Tadpole-like larvae could have evolved from simpler larvae within the tunicate group, and such larvae could have suppressed their metamorphosis into an old-fashioned tunicate, and continued to grow into a sexually mature swimming chordate organism from which the vertebrates eventually evolved

It *could* have happened and such evidence as can be culled from living forms suggests that it did.



In other words, we can trace the dorsal position of our brain and spinal cord to the upward reaching siphons of a primitive attached tunicate, our heart and basic pattern of blood vessels to that of the same organism, our ear passage to a respiratory gill slit of an early shark and in turn to a water-escape passage of the sessile ascidian, our pituitary gland (the master gland of our endocrine system) to the subneural gland and hypophysial tube of the same form, while our tubular spinal cord and brain, our backbone and trunk muscles derive from the tail of the swimming larva the ascidian evolved and managed to make permanent.

Since the time primeval events such as these took place, the tunicates have had just as much time as all other surviving groups have had to become specialized in various ways, in their case to elaborate the gill-filtration system, budding and colony formation, etc , and there is no suggestion that in tunicates as they now exist we recognize our contemporary ancestors

BIBLIOGRAPHY.—J. Hopkinson, "Bibliography of the Tunicata," Ray Society, London (1913). This is a complete list of publications from 1469 to 1911 There is no recent general account of the tunicates in English, but excellent German texts by J Huus, I E. W Ihle, H. Lohmann and G. Neumann are included in the *Handbuch der Zoologie* of Kukenthal and Krumbach, vol 5, second half (1933–37). Articles in English written from more limited points of view, consult W. Garstang, "The Morphology of the Tunicata," *Quart. Jour. Microscopical Science*, vol. 72 (1928), and N. J. Berrill, "Studies in Tunicate Development," *Philos. Trans*, Royal Soc., London, vols. 228–225 (1929–36).

(N J. B.)

TUNING FORK, a two-pronged instrument of high-grade steel, which by the vibration of its prongs gives out a single pure musical tone of constant pitch. The pitch depends upon the natural period of vibration of the prongs, that is, upon their length and thickness.

COURTESY OF WESSEL, MILNEY AND CO., LTD
THE TUNING FORK, INVENTED IN 1711

Tuning forks may be made for all musical pitches in the audible range, and the fork which gives the A above middle C is usually taken as the musical standard. For laboratory purposes the forks may be mounted upon hollow boxes to increase the volume of sound by resonance. They may be set in momentary vibration by a light blow, or kept in constant vibration by the action of an intermittently energized electromagnet upon one of their prongs. The tuning fork was invented by John Shore in 1711. (*See* PITCH, MUSICAL.)

TUNIS, capital of Tunisia, in lat. 36° 48′ N. and long. 10° 12′ E., is on a mountainous isthmus separating the Sebkha Sedjumi from the Bahira, or Lake of Tunis, the west bank of which it occupies. The Bahira communicates with the sea 6 mi. E.N.E. of the town by a narrow, open channel. Tunis stands, as Carthage does, on the threshold of the western bay of the Mediterranean, at the natural outlet of the western bay of the Tunisian Tell and in easy communication with the south But its topographical situation differs profoundly from that of the ancient town: built at the end of a shallow lagoon, it has been obliged to make use of an intermediate town, Goletta (*q.v*) or La Goulette, for a part of its sea trade. While Carthage had an almost insular position,

Tunis was sheltered from the attacks of Christian fleets and has an almost continental site

Tunis consists of two towns side by side the old native town lies between the hills of Bir-Kassa and those of Ras-Tabia, on a slope down to the Bahira; the European town has developed on the flat, low-lying ground between old Tunis and the lake

European Tunis is built on a regular, somewhat monotonous plan, the blocks of houses are bordered by rectilinear avenues, some of which are planted with trees One avenue, nearly a mile long, laid out from east to west, bore successively the names of Avenue Jules-Ferry, Avenue de la Marine and Avenue de France. On this artery stand the residency, surrounded by gardens, the cathedral, the casino-theatre, the banks and the principal hotels and cafés It is cut at right angles by another avenue, called in its southern part Avenue de Carthage and in its northern part Avenue de Paris, which stretches for more than two miles From these two main avenues numerous streets branch off. The Avenue de France is the most animated street of Tunis and is the centre of the city's life.

The native town itself includes three distinct parts the Médina, or central city, which represents the primitive settlement, several gates of which are still standing; the suburb of Bab-Souika on the north, where the Jews live; and that of Bab-Djazira on the south The Djamâ Zitouna, or Mosque of the Olive Tree, is the seat of an important Moslem university, founded in 732 by the Omayyad governor Obeid-Allah and reconstructed by the Aghlabites (9th century), most of its buildings date from the 13th to the 15th centuries. Behind the Zitouna are the *souks*, which are the most interesting feature of the native town They are composed of little shops opening onto narrow, tortuous streets, covered by arches or roofs of planks, where only foot passengers can go. Each kind of trade, each group of craftsmen, has its special quarter. Tunis possesses many mosques, notably those of the Kasba (13th century) and Sidi-Mahrez (17th century). Christians may not enter them.

The port of Tunis, constituted in 1893 by the digging of a sea channel more than 6 mi. long and 7·5 m deep, comprises a central dock, a dock for ore and a dock for sailing ships. After World War II, during which much of the port was destroyed, a fairway and a 74-ac dock were opened at the outer harbour of La Goulette (10.5 m. deep), as well as two quays for hydrocarbons and phosphates. Tunis and La Goulette together form the major port of Tunisia, handling 2,000,000 metric tons a year (including 1,300,000 metric tons of exports, mainly wine, fruit, vegetables, oil, iron and phosphates) and providing also for passenger traffic and fisheries.

Tunis is the centre of a rich farming region. Its industrial products include beer, soft drinks and syrups, chocolate, canned vegetables and fruits, tobacco, leather, textiles and chemicals; the manufacture of carpets is an old-established craft. The industrial suburbs of Djebel Djelloud, Sidi Fatallah and Mégrine lie to the southeast

The urban population, 364,593 (1946 census), was estimated to be 380,000 in 1952, with the population of the suburbs added, the total amounted to 500,000, including 155,000 Europeans and 40,000 Jews. This represents a large proportion in a country of 3,500,000 inhabitants

Southeast of the city, along the valley of the Melain, are magnificent remains of the Roman aqueduct from Zaghouan to Carthage. Carthage itself is on the coast to the north, as also is another picturesque town, Sidi bou Said South of Tunis is the seaside resort of Hamman-lif.

Tunis existed in the Carthaginian epoch, but its importance dates only from the Moslem conquest. It became capital toward the end of the 9th century, under the Aghlabites, and reached its greatest prosperity in the Hafsid period, when it is said to have surpassed Cairo. Attacked in 1270 by Louis IX, who died under its walls, it was taken by Khair ed-Din Barbarossa in 1533. Charles V took possession of it in 1535; the Spanish were driven out in 1569, retook it in 1573, but ceded it to the Turks in 1574. Thereafter the history of Tunis merged with that of Tunisia (*q v*).

TUNISIA, a French protectorate of North Africa, extending from lat 30° to 37° 20′ (Cap Blanc) N and from long 7° 35′ to 11° 40′ E It is bounded on the west by Algeria, on the north by the Mediterranean, on the east by the Syrtis (gulfs of Hammamet and of Gabès) and, from the sea to Ghadames, by Libya and on the south by the Southern Territories of Algeria. The total area is 48,329 sq mi, of which about 21,500 sq mi is Saharan territory beyond the Chott Djerid The country, halfway between the Straits of Gibraltar and the Suez canal, forms, with Sicily, the barrier between the eastern and western Mediterranean This situation and the possession of nearly 900 mi of coast line gives economic and political importance to Tunisia

Physical Features.—The mountains are formed of Secondary and early Tertiary rocks, while later Tertiary and Quaternary rocks cover the plains. The folds are Miocene in the main, as in the Atlas, but movement continued long after that period There are numerous short discontinuous chains of varying orientation and a number of small circular or elliptical domes

North of the concatenation of the Dorsal mountain ranges, which lies across the country from Tebessa to Cap Bon, the chains of the Tell tend from southwest to northeast Farther north rise the wooded sandstone mountains of Kroumirie (3,000 ft) and the Mogods, where the coast is broken and wild Next, standing round the alluvial plains of the middle and lower Medjerda and of Bizerta and Tunis itself, there are mountains and hills of chalk and marl used for pasturage or cultivation Relief is heightened in the High Tell, between Kef (Le Kef) and Téboursouk, and in the Dorsal mountains (Chambi, 5,065 ft), but between the massifs there are wide depressions, varying in elevation from 1,300 to 2,600 ft, which are under crops. South of the Dorsal, in the steppes, the barren mountain chains are not so high and tend southwest-northeast, west-east (Gafsa) and south-north; they are also further apart, with wide alfa-covered spaces between them To the east the plains of the lower steppe, with Qairwan (Kairouan) and Sfax, are watered in the north by the wadis Marguellil and Zeroud but are characterized elsewhere by closed depressions with sebkha. Behind Sousse stand the little hills of the Sahel Finally, to the south of Gafsa, the Sahara begins with the clayey depression of the chotts Gharsa, Djerid and Fedjedj, the dunes of the eastern Erg and the plateau of the Matmata tribes and of the Dahar The Dahar has on its eastern side the semiarid plain of the Djeffara, which borders the Gulf of Gabès In the gulf itself are the islands of Djerba and Kerkena.

With a Mediterranean climate, Tunisia shows fewer contrasts in its different regions than do the Tell, the steppe and the Sahara in Algeria The average January temperature at Tunis is 52·7° (maximum average 59.7°, minimum average 45.6°); the hottest month has an average of 79.2° (maximum average 92°, minimum average 66·4°).

The winds are chiefly northwest in winter and northeast in summer; the rainy season runs from October to May Rain is heaviest in the winter The distribution of rain is, however, highly irregular from region to region and from year to year, North Africa, in general, is in a zone of climatic discontinuity, and a small change of the winds may mean great changes in rainfall.

One zone gets more than 24 in. of rain per year, and this includes the massifs of Kroumirie and the Mogods, the next zone, with 16–24 in of rain, includes central Tunisia, the valley of the Medjerda, Cap Bon and the region of Tunis (Tunis 16 in., Téboursouk 20, Kef 19); a zone with 8–16 in. south of the Tunisian ridge includes the region of Qairwan and the Sahel (Qairwan 11 in., Sousse 14, Sfax 8); there is a zone with less than 8 in. in the south and extreme south (Gabès 4 in., Gafsa 6, Médenine 5). Despite the meagre precipitation there, the hills of the Sahel, the coastal plains of Sfax and even of the Djeffara and the islands of Kerkena and Djerba grow olives thanks to the humidity of the atmosphere, which condenses in the sandy soils

The principal river is the Medjerda, rising in Algeria near Souk-Ahras and flowing into the Mediterranean near Porto Farina It is

228 mi. long; its affluents are the wadis Méllègue. Tessa and Siliana, which come down from the High Tell. In floodtime the volume of the Medjerda may be 35,315 cu ft.; in drought it may go down to 35 cu ft. This river has formed large alluvial plains, filling up the ancient Gulf of Utica and joining a series of shore islets The rivers of the eastern slope (Zeroud, Marguellil) dry up in basins of the lowland which communicate with the sea only when rains are exceptionally heavy.

The northern coast is much dissected Standing out to sea is the island of La Galite; the Lake of Bizerta has kept its depth because the alluvium is deposited in the Garra Aghkel above it The Lake of Tunis is a shallow lagoon.

Beyond the Cap Bon peninsula, the eastern limit of the Gulf of Tunis, the east coast is low and sandy, bordered by lagoons in several places and shelving slowly into shallow water around the Kerkena archipelago and Djerba Island.

Flora for the most part is Mediterranean; 1,350 out of 2,000 plant species occur also in Italy Forest, scrub and steppe are the characteristic formations. The cork oak and the *zean* oak cover Kroumirie and the Mogods (400,000 ac.). The woods of the centre are less compact The Aleppo pine (2,000,000 ac.) and the thuja are the chief forms. In the south one finds, chiefly, the juniper, with some Aleppo pines and pistachio nuts Bled-Tala has a forest steppe with gum trees (*Acacia tortila*), the most northerly occurrence of a species found from Senegal to Arabia The scrub is usually degraded forest, and its most characteristic tree is *Zizyphus lotus*, the spiny jujube tree The steppe is covered by grasslike types such as the alfa or esparto grass and by species of *Artemisia*.

The fauna is much like that of Algeria, with European species Mammalian fauna is mainly Eurasiatic, but among reptiles and fish some Africano-Brazilian forms persist. Stag (*Cervus elaphus barbus*) is found in Kroumirie and the sleeved mouflon in the mountains. (J.-J. Ds.)

HISTORY

The history of Tunisia begins with the establishment of the Phoenician colonies (*see* CARTHAGE; PHOENICIA). The Punic settlers Semitized the coast but left the interior almost untouched Under the Romans, Punic speech and civilization gave way to Latin, a change which from the time of Caesar was helped by Italian colonization; to this region the Romans gave the name "Africa."

Rich in corn, herds and, in later times, oil, and possessing valuable fisheries, mines and quarries, the province of Africa, of which Tunisia was the most important part, attained under the empire a prosperity to which Roman remains in all parts of the country still bear witness Carthage was the second city of the Latin part of the empire, "after Rome the busiest and perhaps the most corrupt city of the West, and the chief centre of Latin culture and letters." The emperor Septimius Severus and the philosopher Apuleius were Africans. Moreover, in the early history of Latin Christianity. Africa holds a more important place than Italy, in Africa Christian Latin literature took its rise, and to this province belong the names of Tertullian and Cyprian, of Arnobius and Lactantius and, above all, of Augustine Lost by Rome to the Vandals, who took Carthage in 439, the province was recovered by Belisarius (533–534) and remained Roman till the Arab invasions of 648–669 The conqueror, Okba (Uqba) ibn Nafi, founded the city of Qairwan (671), which was the residence of the governors of "Ifriqiyah" under the Omayyads and thereafter the capital of the Aghlabite princes, the conquerors of Sicily, who ruled in merely nominal dependence on the Abbasids.

Arab and Berber Dynasties.—The Latin element in Africa and the Christian faith almost disappeared in a single generation; the Berbers of the mountains, who had never been Latinized and never really Christianized, accepted Islam without difficulty, but showed their stubborn nationality not only in the character of their Mohammedanism—which has always been mixed with the worship of living as well as dead saints (marabouts) and other peculiarities—but also in political movements. The empire of the Fatimites (*q.v.*) rested on Berber support, and from that time until the advent of the Turks the dynasties of North Africa were really native, even when they claimed descent from some illustrious Arab stock When the seat of the Fatimite empire was moved to Egypt (972), the Zeirids, a house of the Sanhaja Berbers, ruled as their lieutenants at Mahdia, and about 1050 Mu'izz the Zeirid, in connection with a religious movement against the Shi'ites, transferred his very nominal allegiance to the Abbasid caliphs Sent in vengeance by the Fatimite caliph, a vast horde of Bedouins from Upper Egypt (Beni Hilal and Sulaim) ravaged all North Africa. Unable to found an empire or overthrow the settled government in the towns, the invaders made order and prosperity almost impossible in the open parts of the country until its effective occupation by the French The Zeirid dynasty was finally extinguished by Roger II of Sicily, who took Mahdia in 1148 and established his authority over all the Tunisian coast. Even Moslem historians speak favourably of the Norman rule in Africa; but it was brought to an early end by the Almohade caliph of Morocco, Abd ul-Mumin, who took Mahdia in 1160

The Almohade empire soon began to decay, and in 1336 Abu Zakariya, prince of Tunis, proclaimed himself independent and founded a dynasty which subsisted till the advent of the Turks. The Hafsids (so called from Abu Hafs, the ancestor of Abu Zakariya) assumed the title of "prince of the faithful," a dignity which was acknowledged even at Mecca when, in the days of Mustansir, the second Hafsid, the fall of Baghdad left Islam without a titular head. In their best days the Hafsids ruled from Tlemçen to Tripoli, and they received homage from the Merinids of Fez; they held their own against repeated Frankish invasions, of which the most notable were that which cost Louis IX of France his life (1270) and that which Louis II of Bourbon led (1390), when English troops took part in the unsuccessful siege of Mahdia. The Hafsids adorned Tunis with mosques, schools and other institutions, favoured letters and in general appear to have risen above the usual level of Moslem sovereigns Their rule was troubled by continual wars and insurrections and later by family dissensions.

Turkish Rule.—The conquest of Algiers by the Turks gave a dangerous neighbour to Tunisia, and after the death of Mohammed the Hafsid in 1525 a disputed succession supplied Khair ed-Din Barbarossa with a pretext for occupying the city in the name of the sultan of Constantinople. Al-Hasan, the son of Mohammed, sought help from the emperor and was restored in 1535 as a Spanish vassal, by a force which Charles V commanded in person, while Andrea Doria was admiral of the fleet But the conquest was far from complete The interior was a prey to anarchy and civil war until, in 1570, Ali Pasha of Algiers utterly defeated Hamid, the son and successor of Al-Hasan, and occupied Tunis. In 1573 the Turks again retreated on the approach of Don Juan, who had dreams of making himself king of Tunis; but in the next year Sultan Selim II sent a strong expedition which drove the Spaniards from Tunis and Goletta (La Goulette) and reduced the country to the status of a Turkish province Nevertheless, the Spanish occupation left a deep impression on the coast of Tunis.

Within a few years after the Turkish conquest, a military revolution (1590) transferred the supreme power to a dey elected by the janissaries, who formed the army of occupation The government of the deys lasted till 1705. The beys, whose proper function was control of the tribes and who from 1637 onward had overshadowed the deys, took full control when Hussein ben Ali was proclaimed sovereign by the troops under the title of "bey" Being a prince of energy and ability, he was able to establish the hereditary sovereignty which lasted without change of dynasty.

Under deys and beys alike Tunisia was essentially a pirate state. Occasional acts of chastisement (of which the bombardment of Porto Farina by Robert Blake in 1655 was the most notable) and repeated treaties, extorted by European powers, checked from time to time but did not eliminate the habitual piracies, on which indeed the public revenue of Tunis was mainly dependent. The powers were generally less concerned for the captives than for the acquisition of trading privileges, and the beys took advantage of the commercial rivalry of England and France to play them off one against the other. The definite abandonment of piracy may

be dated from the presentation to the bey in 1819 of a collective note of the powers assembled at Aix-la-Chapelle. The government had not elasticity enough to adapt itself to so profound a change in its ancient traditions No attempt was made to improve conditions of the country, except perhaps under Mohammed as-Saduk, who succeeded to the throne in 1859 In the third quarter of the 19th century not more than a tenth part of the fertile land was under cultivation Taxation was ruinous, and borrowing in Paris increased the public debt enormously. The yearly charges on the debt exceeded the whole annual revenue Discontent flamed into insurrection under attempted constitutional and military innovations, and the inevitable revolution was postponed only by the rivalry of the European powers with interests in the country The French had come to regard Tunisia as the natural extension of Algeria, although after the Crimean War Turkish rights over Tunis were revived The embarrassed bey, after the Franco-German War, turned toward Great Britain for advice, and a British protectorate—suggested by the remarkable influence of the celebrated Sir Richard Wood, British diplomatic agent at the court of Tunis from 1855 to 1879 The railways, lighthouses, gas and waterworks and other concessions and industries were placed in British hands But in 1878, at the Congress of Berlin, Lord Salisbury agreed to allow France a "free hand" in Tunisia in return for French acquiescence in the British lease of Cyprus

The French Protectorate.—After 1862, however, the kingdom of Italy began to take an interest in Tunisia Italian residents outnumbered other European groups Italians were the commercial and industrial leaders. In 1879, of the 683 vessels entering the port of Goletta, more than 500 were Italian. When the country went bankrupt in 1869, a triple control was established over Tunisian finances, with British, French and Italian "controllers" In 1880 the Italians bought the British railway from Tunis to Goletta. This and other actions excited the French to act on the understanding effected with the British at the Berlin congress. In 1881 a French force crossed the Algerian frontier under pretext of chastising the independent Kroumir tribes on the northeast of the regency and, advancing on the capital, compelled the bey to accept the French protectorate. The conquest of the country was not effected without a serious struggle with the Tunisians, especially at Sfax; but all Tunisia was brought eventually under French control.

Mohammed VI, the reigning bey, signed the treaty acknowledging a French protectorate at the Bardo palace on May 12, 1881. He died in Oct. 1882, and a new treaty, that of La Marsa (June 8, 1883), was signed by his brother and successor, Ali IV. From 1884 onward the French, under a resident-general, carried out a thorough reform of the administration. Great Britain early recognized the protectorate, as did most of the other powers Turkey did not, and though the boundary between Tunisia and Tripolitania was established by the treaty of May 19, 1910, between France and the Ottoman empire, it was not until the treaty of Lausanne (1923) that Turkish claims to the regency were finally renounced Italy, however, was more deeply concerned by the establishment of the French protectorate, having looked forward to the acquisition of Tunis. The Italian government renounced its consular tribunals in Tunisia in 1884, as the other powers had done in 1883, but insisted on its other capitulatory rights (under a treaty of 1868) till 1896. By the terms of a convention then concluded the right of Italians in Tunisia to maintain their nationality was guaranteed British subjects had the same right, this affected chiefly the Maltese settled in the country The persistence shown by Italians and Maltese in maintaining their nationality, however, was a cause of annoyance and some practical inconvenience to the French. Decrees issued in 1921 declaring that British and Italian subjects, born of parents who were themselves born in Tunisia, would be deemed to be of French nationality provoked resentment, especially among the Italians. As to the British (*i.e.*, Maltese) an arrangement was reached in 1923 whereby the persons affected were entitled to decline French nationality. The Laval-Mussolini agreements of 1935, providing for the termination of Italy's special privileges, were never applied They were to be denounced in 1938 by Mussolini, who made the acquisition of Tunisia one of the aims for which Italy declared war on France in 1940

The nomad tribes in the south gave occasional trouble, but French rule was generally accepted. During World War I tribesmen from Fezzan, led by Turkish officers, had attacked the French outposts in southern Tunisia There was some sharp fighting in Sept and Oct. 1915, when the French re-established order Later, large numbers of Tunisian soldiers were employed in France. By the agreement of Sept. 12, 1919, the territory south of Tunisia forming salients between the oases of Ghadames and Ghat (Gat) and between Ghat and Tummo was transferred to Libya.

Nationalism arose in Tunisia before World War I under the leadership of "Young Tunisians" influenced by European education and thought The movement increased in importance under the stimulus of postwar movements in the near east; in 1920 various groups united to form a Constitutional party or Destour (Constitution), whose nine-point program had the objective of securing democratic forms of government. A series of economic councils was created in 1922, but nationalist activity continued until 1925, when the French took effective measures to disperse the leaders and break up the movement. The economic depression of the early 1930s and the appearance of younger leaders facilitated the revival of nationalism These leaders formed the Neo-Destour (1934), with a program of vigorous action involving organization of the masses and the assistance of French leftist leaders and nationalists in Morocco and Algeria. The Neo-Destourians expected much from the French popular front government of 1936, which, however, added only minor reforms in 1937 to those granted in 1933 and 1935 After clashes with the police in April 1938, 200 nationalists were arrested and both the Destour and the Neo-Destour were dissolved. (P. W. I.; X.)

Meanwhile, down to 1926, the Italians had been gaining on the French both by immigration and by natural increase, and after the rise of fascism in 1922 everything possible was done by the Italian government to encourage national ambition among them France therefore embarked on a policy of voluntary naturalization, made palatable by economic benefits After 16,824 Italians had been naturalized, the number of French nationals in Tunisia (108,068) was, in 1936, for the first time greater than the number of Italians (94,289)

After the Franco-German armistice and Italy's entry into World War II (June 1940), Tunisia, like the rest of French North Africa, came under Vichy rule. Trade was paralyzed, and there was an acute shortage of imports, particularly of fuel and textiles. The day after the Allied landings in North Africa (*see* WORLD WAR II) the Germans, unopposed by the resident-general, Adm. J. P Esteva, occupied the country (Nov 1942). For six months Tunisia was a battleground; then in May 1943 the German and Italian armies collapsed. Esteva fled, and the bey, Mohammed el-Moncef, was deposed by the French and replaced by their heir apparent, Mohammed el-Amin The French maintained that El-Moncef had collaborated with the Germans; but in fact he seems to have resisted German pressure to the best of his ability, and the French decision to depose him caused trouble down to his death in 1948 The Italian capitulations were abolished by an ordinance of June 22, 1944, duly recognized by the Italian government

At the end of 1943, meanwhile, the military rule established at first by Gen. Charles Mast, the new resident-general, was relaxed; many Arabs arrested for "collaboration" were set free. Some political reforms were promised but economic difficulties aggravated Moslem discontent, and nationalist agitation was resumed A repressive policy was adopted, and in April 1945 Habib Bourguiba, the influential leader of the Neo-Destour, fled to Cairo.

In Aug. 1946 the secretary-general of the Neo-Destour, Salah ben Youssef, summoned a meeting in Tunis of the nationalist parties and groups, which unanimously passed a resolution condemning the protectorate and demanding complete independence. The principal nationalist leaders were then arrested, to be released a few weeks later, when General Mast announced reforms.

In Feb. 1947 Jean Mons was appointed to succeed Mast as resident-general. Mons first tried [illegible]

failed because both the Destour and the Neo-Destour refused to accept either the continuance of the protectorate or the entry of Tunisia into the French union and insisted on the return of El-Moncef In Aug. 1947 Mons therefore formed a Tunisian ministry composed of moderate elements with no definite party leanings But whereas previously there had been only three Tunisian ministers, all departments of state being under French directors, all French directorships except those of education, finance and public works were now abolished and five more ministries given to Tunisians. These ministers were assisted by French councillors, whose agreement to ministerial propositions had to be obtained, differences between them being resolved by a "cabinet council" partly Tunisian and partly French. Mohammed Kaak, a lawyer, was prime minister and minister of justice.

In spite of great difficulties considerable progress was made in education But land-settlement plans came to nothing, health services lagged, and there was little diminution of the controlling power of the French in local as in central administration

The nationalists were therefore very restive. Habib Bourguiba (with official French sanction) returned to Tunisia in Sept 1949 and for the next six months campaigned throughout the country for the abolition of the protectorate and for the grant of autonomy. In April 1950 he went to Paris and published a program in which, while renouncing the claim to complete independence, he put forward in Aug 1946 and which the willingness to admit Frenchmen to elected Tunisian councils, he yet asked for a progressive transfer of sovereignty, for a new treaty and for internal autonomy.

In June 1950, Louis Périller, the new French resident-general, admitted that substantial reforms were necessary and that direct administration should be ended within the framework of the treaties establishing the protectorate In August a ministry was led by Mohammed Shenik in which the Tunisians participated in equal strength with the French and in which, for the first time, the Neo-Destour was represented by Salah ben Yussef. Because of pressure by the French settlers, no reform was achieved, but the Tunisian ministers' French advisers were removed Another step toward internal autonomy, however, was taken in Feb 1951, when it was decided that the council of ministers was henceforth to be under the chairmanship of the premier instead of that of the resident-general and that the certificate of the secretary-general of the residency was no longer required to validate ministerial decisions

While French settlers made known their fear that Tunisian emancipation would end in the eviction of the French, Habib Bourguiba and Ferhat Hashed, secretary general of the General Union of Tunisian Workers, tried to stir world opinion and sharply criticized the slowness of French policy A nationalist agitation began in December and at the beginning of Jan 1952 Jean de Hauteclocque succeeded Périller as resident-general The Shenik ministry made a complaint against France to the United Nations but this was ruled out of order by the Security council *Disorders* increased after Habib Bourguiba and 11 other Neo-Destour and Communist leaders were arrested.

In March the bey agreed to dismiss the Shenik ministry, which was succeeded by Salah ed-Din Bakkush's government. Tranquillity was restored in April. The French government proposed reforms as follows. Tunisian sovereignty to be recognized, with a gradual advance toward internal self-government, Tunisian assistant-directorships to be set up beside the French directorships, public offices to be reserved in principle for Tunisians; the legislative power to lie with the bey, assisted by two councils (one, legislative, entirely Tunisian, the other, financial, half Tunisian and half French); elections to be held for municipal councils and provincial assemblies

This plan met with sharp criticism in the French national assembly: the right wing thought it went too far, the left not far enough The bey rejected it in August Meanwhile in June the Arab states and certain Asian governments lodged a fresh complaint with the U N The French population of Tunisia objected to the idea of their being excluded from public affairs on the grounds that they paid more than half the taxes and that the country depended on France for financial investments and as a market for its primary products (oil, wine and wheat). The Neo-Destour on the other hand opposed joint sovereignty When the dispute was brought up in December before the general assembly of the U.N , France denied that body's right to interfere

On Sept. 9, 1952, the bey addressed a letter to Pres. Vincent Auriol summarizing the course of Franco-Tunisian relations since World War II in support of his contention that France had repeatedly broken its promise to restore self-government to Tunisia. President Auriol replied deploring the fact that his repeated appeals to the bey's wisdom had been met only by intransigence. On Nov. 29, the French resident-general called upon the bey to indicate by "a plain answer" his willingness to settle the outstanding problems. The situation deteriorated gravely as a result of the murder of Ferhat Hashed in mysterious circumstances during the night of Dec 4–5 On Dec. 20 the bey finally agreed to sign two reform decrees: one establishing elected municipal councils with a two-college system, the other organizing elected provincial councils (*conseils de caïdat*). During the year terrorist activities continued throughout the country.

SOCIAL AND ECONOMIC CONDITIONS

Population.—The population by the 1946 census was 3,230,952, comprising 2,832,078 Moslems, 70,971 Jews and 239,549 Europeans It is concentrated in the cities and on the coast

The Moslems are mostly Berber mixed with Arab, but only about 1% speak Berber. The people of the island of Djerba are mostly of the Ibadhite sect of Islam. The Matmatas (100,000) are troglodytes, living in caves cut in rock or clay. The towns contain some primarily urban elements such as the Andalusian Moors and the Jews Europeans included 144,977 French, 84,935 Italians and 6,459 Maltese In 1931 the French numbered 46,000, the Italians 88,000. Of the European population, 85% live in the towns, 59% in Tunis alone

Tunis (97.9) is the chief city, with a population of 364,593. Other towns are Sfax (pop 54,636), Bizerta (36,560), Sousse (36,560), Kairouan (32,299), Mʼsaken (21,804), Ferryville (29,353) and Gabès (23,512) Other towns exist as ports, as oases or as agricultural centres.

Government and Administration.—By the treaty of Bardo (May 12, 1881) Tunisia came under the occupation of France, with rights set forth in the treaty and in the convention of June 8, 1883 The bey was theoretically sovereign, but a French resident-general, under the ministry of foreign affairs at Paris, controlled all military, naval and civil affairs of the regency. Besides the resident-general, who was assisted by a *délégué* and was also minister of foreign affairs for Tunisia, French directors supervised the army, marine, education, finance, public works, agriculture, post, telegraph and telephone, justice (French) and various other services Tunisians, under French supervision, filled the post of first minister, minister of the Pen (deputy first minister), minister of state and minister of Tunisian justice. However, under the French constitution of 1946, which allowed for the gradual transformation of protectorates into associated states of the French union, reforms were promulgated in 1947 and, more extensively, in Feb. 1951 whereby the sovereignty of the Tunisian state was affirmed and important public offices thrown open to the natives, so that the majority of ministers were thereafter Tunisians.

Local administration is conducted in the traditional form, which has been systematized: the bey is represented by caïds (42 caïdates, 6 of them in the Military Territories of southern Tunisia), seconded by *kahias* and *kalifats* and supervised by *contrôleurs civils* (20 in number) The sheikhs, nominated from a list of three chosen candidates, number about 600 and are the responsible representatives of the people The grand council, which votes the budget, consists of two sections, one French and one Tunisian

Justice is administered by Tunisian and French courts Matters regarding personal status, inheritance, private *habous* and real estate (where Europeans are not involved) are settled by caïds in *shara* courts. Other cases, civil and criminal, involving Tunisians, are judged in *ousara* courts by cadis The French system is composed of 15 justices of the peace, 4 tribunals of first instance and the court of appeals at Tunis (1941).

Tunisia has *melk* lands which are completely freehold, *habou* lands subject to special rules of inheritance, and tribal or group lands A cadastral register was established by law in 1885, with the object of lessening doubts as to ownership of land Colonization depends mainly on private enterprise, and the government came late into the matter. By laws of 1914, 1920 and 1924, those who take up previously domanial land acquire a right to live on them for life or for 20 years. *Habou* lands can be leased for long terms on payment of a perpetual rent (*enzel*), which rent may be redeemed on a basis of 20 years' purchase. Europeans own about 1,901,900 ac. divided into about 6,000 properties

Agriculture.—About 7,315,000 ac., out of a productive area estimated at 22,500,000 ac., are held to be arable. The returns, generally poor, are variable from year to year. Annual average acreage and production of the principal crops in 1945–50 were: hard wheat [illegible]

[illegible]

1950; figs, 2,500,000; oranges, 800,000; other citrus fruits, 300,000 The oases, particularly Tozeur and Nefta, in 1950 provided 3,100,000 date palms, which produced about 35,400 tons

Cattle Rearing and Natural Products.—Cattle rearing and crop growing are extensive rather than intensive. On an average, Tunisia raises annually about 400,000 cattle, 72,000 horses, 47,500 mules, 110,000 asses, 177,000 camels, 42,000 pigs, 1,200,000 goats and 2,000,000 sheep.

Forests (2,500,000 ac) provide firewood and timber (railway sleepers, pit props and stakes for vineyards), as well as cork for export Alfa (141,000 tons in 1950) is exported chiefly to England, for the manufacture of paper pulp Sea fishing is carried on in Tunisia under more favourable conditions than in Algeria The fish are also more varied in kind There are 13,000 fishermen, of whom 12,000 are natives and 1,000 Italians The catch consists mainly of tunny, sardines and sardinella Sponge fishing is carried on along the whole of the east coast, from Monastir to the frontier of Tripoli, especially at Sfax and in the Kerkena Islands, production in 1950 was 82 tons.

Mines.—Tunisia possesses practically inexhaustible deposits of phosphates The chief exploitations is carried on in the Gafsa region (Metlaoui, Ain-Moulares, Redeyef), and exports go through Sfax The phosphates of Kalaa-es-Senan and Kalaa-Djerda, found as a prolongation of those of Tebessa, are exported through Tunis. 1,525,000 metric tons were produced in 1950 Iron ores, abundant and of good quality, are found, especially to the south of Kef and not far from the Algerian frontier, at Douaran, at Djerissa and at Nebzas in the Mogods; production in 1950 amounted to 758,000 metric tons, chiefly red and brown haematite Lead (30,700 tons) and zinc (5,744) come from the country round Béja and the High Tell Other minerals are mercury, manganese, copper, iron pyrites and salt, petroleum has been sought at various places The output of lignites at Cap Bon declined after World War II Power is derived from imported coal and petroleum products; consumption of electricity amounted to 141,000,000 kwhr in 1950. Important industries include flour milling, oil refining, lead melting and distilling; after World War II, moreover, there was considerable industrial development, comprising preserved food, building materials and light engineering workshops. Thermal and mineral springs are numerous

Communications.—Tunisia had 5,622 mi of roads and 1,283 mi of railways in 1950 In the north the Algerian railways and the lines from Tabarka and Bizerta have a gauge of 1 44 m., in the centre and the south the lines of the Haut Tell and the Sousse-Sfax-Gabès, Sousse-Gafsa, Sfax-Gafsa (these two serving the phosphate deposits) and Sfax-Tozeur lines have one of 1 m The major ports are. Tunis, with La Goulette (Goletta) as its forepport, handling imports and exporting the agricultural produce of the Tell and the phosphates of the Haut Tell, Sfax, exporting phosphates, oils and alfa grass, Bizerta, a great naval base that also handles the iron ore of the north, and Sousse, which does little business but deals in olive oil The Tunis aerodrome is an important link in communications between Africa and the east.

Commerce.—Tunisia, Algeria and France are under a single customs union for a number of products, notably cereals For other products, such as wine, Tunisia is under a contingent regime; that is, its products are allowed free into France in quantities established each year French goods receive privileged treatment in the regency. The trade of Tunisia in 1950 amounted to 89,739,000,000 fr. (imports 52,210,000,000 fr ; exports 37,529,000,000 fr) Of the imports, 82% came from the franc area, 4% from the sterling and 7% from the dollar, of the exports, 50%, 13% and 3% went to the same areas, respectively. Tunisia imports textiles and clothing (19% of the total value of imports), food products (16%; e g , sugar, tea and dairy produce), raw materials and unfinished goods (20%), supplies for building and development (19%); and fuel. Principal exports are olive oil (74,000 tons in 1950), wheat and barley (only in good years), wines and alfa grass, mineral produce comes second in value, comprising phosphates (1,688,000 tons), lead and iron ore.

(J.-L. DE.; X.)

TUNNEL, a more or less horizontal underground passage made without removing the overlying rock or soil. In former times any long tube-like passage, however constructed, was called a tunnel. In 1928 the word was sometimes popularly applied to an underground passage constructed by trenching down from the surface, building the arching or other form of structure and then refilling over the top with soil; but a passage so constructed, although indistinguishable from a tunnel when completed, is more correctly termed an "aqueduct," a "covered way" or "subway" (depending on its use) and the operations "cutting" and "covering," instead of tunnelling. Making a small tunnel, afterwards to be converted into a larger one, is called driving a heading, and in mining operations small tunnels are termed galleries, drifts and adits. If the passage leading underground is vertical it is called a shaft; if inclined from the vertical it is called a slope, or inclined shaft; if the shaft or slope is begun at the surface the operations are known as sinking; and if worked upwards from a previously constructed heading or gallery the operations are called risings or stopes (*See* COAL AND COAL MINING, MINING, METALLIFEROUS).

Tunnels may be driven through earth, which usually requires timbering during excavation (and there are many systems of timbering) or the use of a shield, or in rock, which may or may not require timbering, depending on the firmness (*See* Plate, figs. 2 and 3) In earth, and often in rock some form of permanent lining is necessary and it is sometimes formed of closely spaced heavy timbers but more often of some type of masonry Tunnels may be excavated either above or below water level, and in the former case excavated in free air, but, in the latter, where in earth, modern practice usually requires the use of compressed air

Tunnelling has been effected by natural forces to a far greater extent than by man. In limestone districts innumerable swallow-holes, or shafts, have been created by sinking rain water following joints and dissolving the rock, and from the bottom of these shafts tunnels have been made by the water to the sides of hills in a manner strictly analogous to the ordinary method of executing a tunnel by sinking shafts at intervals and driving headings therefrom. Many rivers thus find a course underground In Asia Minor one of the rivers on the route of the Mersina railway extension pierces a hill by means of a natural tunnel The Mammoth Cave of Kentucky, the caverns at Carlsbad, New Mexico, and the Peak caves of Derbyshire are due to natural tunnelling.

Mineral springs bring up vast quantities of matter in solution. It has been estimated that the Old Well spring at Bath has discharged since the beginning of the 19th century solids equivalent to the excavation of a 6 ft. by 3 ft. heading, 9 m. long; and yet the water is perfectly clear and the daily flow is only the 150th part of that pumped out of the great railway tunnel under the Severn. Tunnelling is also carried on to an enormous extent by the action of the sea

Subaqueous Demolitions.—The most gigantic subaqueous demolition hitherto carried out by man was the blowing up in 1885 of Flood rock, a mass about 9 ac. in extent, near Long Island sound, N.Y. To effect this gigantic work by a single instantaneous blast a shaft was sunk 64 ft. below sea-level, from the bottom of which 4 m. of tunnels or galleries were driven so as comple.ely to honeycomb the rock The roof rock ranged from 10 to 24 ft. in thickness, and was supported by 467 pillars 15 ft. square; 13,286 holes, averaging 9 ft in length and 3 in. in diameter, were drilled in the pillars and roof. About 80,000 cu yd of rock were excavated in the galleries and 275,000 remained to be blasted away. The holes were charged with 110 tons of "rackarock," a more powerful explosive than gunpowder, which was fired by electricity. The sea was lifted 100 ft. over the whole area of the rock.

Early Examples of Tunnelling.—With so many examples of natural caves and tunnels in existence it is not to be wondered at that tunnelling was one of the earliest works undertaken by man, first for dwellings and tombs, then for quarrying and mining and finally for water-supply, drainage and other requirements of civilization. A Theban king on ascending the throne began at once to drive the tunnel which was to form his final resting place, and persevered with the work until death. The tomb of Mineptah, at Thebes, was driven at a slope for a distance of 350 ft into the hill, when a shaft was sunk and the tunnel projected a farther length of about 300 ft, and enlarged into a chamber for the sarcophagus. Tunnelling on a large scale was also carried on at the rock temples of Nubia and of India and to some extent by the Aztecs in America, and the architectural features of the entrances to some of these temples might be studied with advantage by the designers of modern tunnel portals.

Flinders Petrie has traced the method of underground quarrying followed by the Egyptians opposite the Pyramids. Parallel galleries about 20 ft. square were driven into the rock and cross galleries cut, so that a hall 300 to 400 ft. wide was formed, with a roof supported by rows of pillars 20 ft. square and 20 ft apart. Blocks of stone were removed by the workmen cutting grooves all round them, and, where the stone was not required for use, but merely had to be removed to form a gallery, the grooves were

wide enough for a man to stand up in. Where granite, diorite and other hard stone had to be cut the work was done by tube drills and by saws supplied with corundum, or other hard gritty material, and water—the drills leaving a core of rock exactly like that of the modern diamond drill.

As instances of ancient tunnels through soft ground and requiring masonry arching, reference may be made to the vaulted drain under the south-east palace of Nimrod and to the brick arched tunnel, 12 ft. high and 15 ft. wide, under the Euphrates. In Algeria, Switzerland and wherever the Romans went, remains of tunnels for roads, drains and water-supply are found. Pliny refers to the tunnel constructed for the drainage of Lake Fucino as the greatest public work of the time It was then by far the longest tunnel in the world, being more than 3 5 m in length, and was driven under Monte Salviano, which necessitated shafts no less than 400 ft in depth. Forty shafts and a number of cuniculi, or inclined galleries, were sunk and the excavated material was drawn up in copper pails, of about 10 gal capacity, by windlasses The tunnel was designed to be 10 ft high by 6 ft. wide, but its

FIG. 1.—EARLY MINING METHODS IN "DE RE METALLICA" (1556) BY GEORG AGRICOLA

A. Shaft, *B*, *C*, *D*. Drifts, *E*. Tunnel, *F*. Tunnel mouth

actual cross-section varied It is stated that 30,000 labourers were occupied 11 years in its construction. With modern appliances and a small percentage of the men, such a tunnel could be driven from the two ends without intermediate shafts in far less time.

No practical advance was made on the tunnelling methods of the Romans until gunpowder came into use. Old engravings of mining operations early in the 17th century show that excavation was still accomplished by pickaxes or hammer and chisel, and that wood fires were lighted at the ends of the headings to split and soften the rock in advance. (*See* fig 1) Crude methods of ventilation by shaking cloths in the headings and by placing inclined boards at the top of the shafts are also on record. Before the advent of the railroad, tunnels were built for canals at many locations and some were of very early date. On the introduction of railways tunnelling became one of the ordinary incidents of a contractor's work. Probably upwards of 4,000 railway tunnels have been excavated, including in this list some of the longest tunnels in the world, such as the Mont Cenis, Saint Gotthard, Simplon and Loetschberg in the Alps; the Hoosac, Moffat and Cascade mountains of the United States, and the Connaught at Rogers pass in Canada. On mountain railways, tunnels often form a large percentage of the length; on the Mexican railway in a distance of 66 m. there are 21 tunnels; on the Southern Pacific 11 tunnels in 25 m., including a spiral tunnel. There are also several long spiral tunnels on the Canadian Pacific railway at the Kicking Horse pass The longest single tunnel, however, is the Shandaken tunnel, 18 1 m. in length, built by the City of New York (1917–24) as an extension of the Catskill aqueduct system for water-supply, in Greene county, N.Y.

TUNNELLING UNDER RIVERS AND HARBOURS

Through Tunnelling Methods.—In 1818 Marc Isambard Brunel took out a patent for a tunnelling process, which included a shield, and which mentioned cast iron as a surrounding wall His shield foreshadowed the modern shield, which is substituted for the ordinary timber work of the tunnel, holds up the surrounding earth during excavation, affords space within its shelter for building the permanent lining, overlaps this lining in telescope fashion and is moved forward by pushing against the front ends The advantages of cast iron lining are that it has great strength in small space as soon as the segments are bolted together, and its joints can be caulked water-tight

First Use of Shield.—In 1825, Brunel began, and completed in 1843, after several suspensions of operations, the Thames tunnel between Rotherhithe and Wapping. It was constructed for a highway, but was never used for that purpose It was sold in 1866 to and has since been used by the East London railway, which operates its trains through it. This early tunnel, built of brick, in the form of two arches with frequent openings between them, has a length of 1,200 ft., and required an excavation opening 27 ft. in width, which is still one of the widest ever built under such conditions Brunel employed a peculiar form of shield, made of timber, in several independent sections. Part of the ground penetrated was almost liquid mud, and the cost of the tunnel was about £433 per linear foot. In 1830 Lord Cochrane (afterwards the 10th earl of Dundonald) patented the use of compressed air for shaft sinking and tunnelling in water-bearing strata. Water under any pressure can be kept out of a subaqueous chamber or tunnel by introducing sufficient air of a greater pressure, and men can breathe and work therein—for a time—up to a pressure exceeding four atmospheres. To confine the compressed air it is necessary to provide a substantial bulkhead across the workings To pass men and materials through the bulkhead there is a mechanical device called a lock, which is a large steel tube, with doors at each end, both of which open inward toward the working chamber, and both of which can never be opened at one time because of the difference in air pressure between that in the working chamber and that back of the bulkhead. Valves are provided to admit compressed air to the lock from the working chamber, and also to exhaust it from the lock to back of the bulkhead, in order to manipulate the doors.

The Severn tunnel 4 33 m. in length, for a double line of railway, was begun in 1873 and finished in 1886. Hawkshaw, Son and Hayter were the engineers, and T. A Walker the contractor. At the lowest part the depth of water was 59 ft at low water and 104 ft. at high water, and the thickness of sandstone over the brickwork was 45 feet. Under a depression in the bed of the river on the English side there is a cover of only 30 ft of marl. Much water was met with throughout. In 1879 the works were flooded for months by a land spring on the Welsh side of the river, and on another occasion from a hole in the river bed at the Salmon pool. This hole was filled with clay and the work completed beneath The total amount of water raised

at all the pumping stations was about 27,000,000 gal. in 24 hours.

The length of the railway tunnel under the Mersey between Liverpool and Birkenhead, is 1 m. between the pumping shafts on each side of the river From each a drainage heading was driven through the sandstone with a rising gradient towards the centre of the river. This heading was partly bored out by a Beaumont machine to a diameter of 7 ft. 4 in and at a rate attaining occasionally 195 ft. per week. All of the tunnel excavation, amounting to 320,000 cu.yd , was done by hand labour, as heavy blasting would have shaken the rock. The minimum cover is 30 ft. between the top of the arch and the bed of the river Pumping machinery is provided for 27,000,000 gal. per day, which is more than double the usual quantity of water. Messrs Brunlees and Fox were the engineers and Messrs Waddell the contractors for the work which, taking six years, was completed in 1886

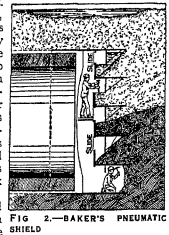

FIG 2.—BAKER'S PNEUMATIC SHIELD

Some 30 m. of brick-lined waterworks tunnels have been built under the Great Lakes since 1864, mostly in clay, without the use of shields, although in the later ones compressed air was utilized. A large portion of one of the tunnels at Cleveland, O , 9 ft. interior diameter, was built at the rate of 17 ft. per day at a cost of about $18 per foot. During this work three explosions of inflammable gases occurred in which 19 men were killed and others were injured. Later a fire at the shaft in the lake caused the death of ten men. Work was thereafter completed under the direction of George H. Benzenberg. Less serious accidents, principally explosions of marsh gas, occurred in many of the other tunnels.

In 1869 P. W. Barlow and J G Greathead built the Tower footway under the Thames, using for the first time a cast iron lining and a shield which embodied features of Brunel's design

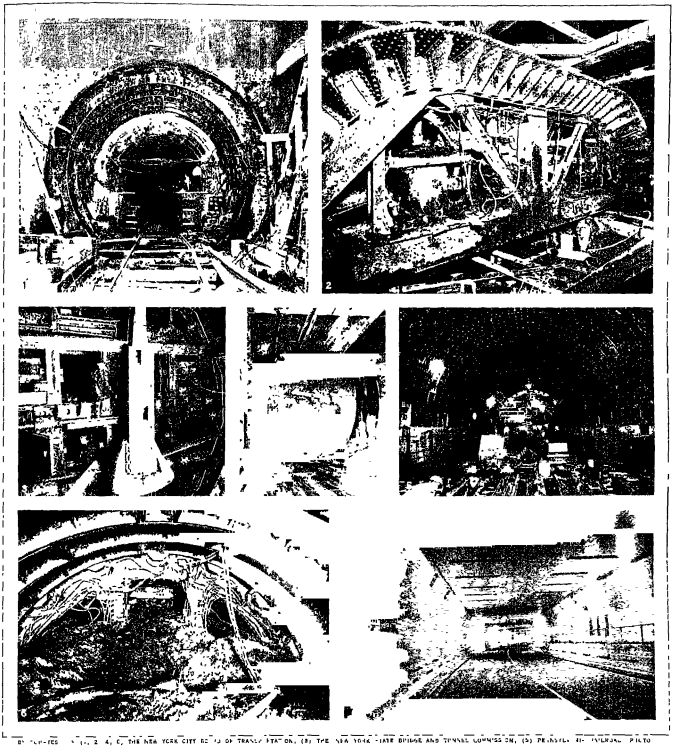
First Tunnel in Compressed Air.—Compressed air was first used in tunnel work by Hersent, at Antwerp in 1879, in a small drift with cast iron lining In the same year compressed air was used for the first time in any important tunnel by D. C. Haskin, in the famous first Hudson River tunnel, from Hoboken, N.J., to Morton street, New York city. This tunnel was to be of two tubes, each 16 ft wide by 18 ft. high In June 1880 the northerly tube had reached 360 ft. from the Hoboken shaft. The compressed air blew a hole through the soft silt of the roof at this spot, and the water entering drowned the 20 men. With British capital and largely under the direction of British engineers (Sir Benjamin Baker and E. W Moir), the northerly tunnel was extended 2,000 ft. to about three-fourths of the way across but in 1891, the tunnel was allowed to fill with water and it so remained for ten years Both tubes were completed in 1908, under the direction of Charles M. Jacobs, engineer In the meantime, two others were started crossing under the Hudson from beneath the Pennsylvania railroad station in Jersey City to Cortlandt street, New York, and connecting tubes on the New Jersey side paralleling the Hudson river. These tunnels which form parts of the Hudson and Manhattan railroad system, were put in operation in 1910 under electric traction by third rail (*See* ELECTRIC TRACTION.)

The use of compressed air in the first Hudson tunnel, and of annular shields and cast iron lining in constructing the City and South London railway (1886–90) by Greathead, became widely known and greatly influenced subaqueous and soft-ground tunnelling thereafter. The pair of tunnels for this railway, from near the monument to Stockwell, from 10 ft. 2 in. to 10 ft. 6 in. interior diameter, were constructed mostly in clay and without the use of compressed air, except for a comparatively short distance through water-bearing gravel. In this gravel a timber heading was made, through which the shield was pushed. The reported total cost was £840,000. Other tunnels, lined with cast-iron segments and constructed by means of annular shields and the use of compressed air, were constructed after the City and South London work was well advanced.

The St Clair River tunnel (Joseph Hobson, engineer) from Sarnia to Port Huron, Mich , was built in 1889–90, through clay, and for a short distance through water-bearing gravel It is 1·14 m. in length and 21 ft external diameter. This tunnel was the first one completed in America in which were used all the essential elements for successful subaqueous work; *i.e.*, a shield, compressed air and cast-iron rings

In 1890–93 a shield-driven vehicular tunnel was constructed in sand and gravel across the Clyde in Glasgow, Scotland It consists of three parallel cast iron tubes with an internal diameter of 16 ft , the centre one being a footway and the outer tubes for vehicles in each direction. The footway is reached by inclined ramps and stairs, but the vehicles are lowered and raised by elevators in shafts of 76 ft. inside and 80 ft outside diameter. The distance between shafts is 700 feet The cost was £287,000 This tunnel was not a financial success because of competition by a municipal ferry and its use, though interrupted, was resumed

In 1891 the tunnel of the Ravenswood Gas Co. in New York city was started by Jacobs and Davies, engineers, crossing beneath the East River and Blackwell's island from between 70th and 71st streets in Manhattan, to Ravenswood in Long Island city. It was expected to be a rock tunnel throughout and the section was to be 8 ft. 6 in. high and 10 ft 6 in. wide, to provide room for two 3 ft. and one 4 ft gas mains. Soft ground was encountered and great difficulty was found because of the depth and water pressure. Compressed air was adopted, the pressure at times reaching as high as 46 lb per square inch. Eventually, it was necessary to line the soft ground sections with cast iron rings of 10 ft. 2 in. internal diameter. The work was completed in 1894.



The notable Blackwall tunnel, under the Thames about 6 m. below London bridge (Sir Alexander Binnie, engineer, and S Pearson and Sons, contractors), was built in 1892–97, through clay and 400 ft of water-saturated gravel. The tunnel is about 3,116 ft *long*, the external diameter 27 ft and the internal diameter 24 ft. 3 inches. The shield, 19 ft. 6 in. long, contained a bulkhead with movable shutters, as foreshadowed in Baker's proposed shield (fig. 2) There are a roadway 16 ft. wide for vehicles and two footwalks 3 ft. wide. The maximum grade is 2·78%.

Numerous tunnels of small diameter have been constructed by the use of shields under the Thames and Clyde for electric and cable ways, several for sewers in Melbourne and under the Seine at Paris for sewer siphons.

The Rotherhite tunnel, under the Thames, about 2·25 m below London bridge, provides for a vehicular roadway 16 ft. wide and two footwalks 4 ft. 8 in. wide. It has a length of 4,863 ft. between portals, of which about 1,400 ft. are directly under the river The exterior diameter of the tunnel is 30 ft. and the interior 27 feet The maximum grade is 2·7%. It is constructed of cast iron rings and concrete lining, and a shield and compressed air were used It was begun in 1904 and finished in 1908. Maurice Fitzmaurice was the engineer of design and construction, and Price and Reeves the contractors The top of the main tunnel excavation in the middle of the river was only 7 ft. from the bed of the Thames, and a temporary blanket of filled earth, usual in similar cases, was prohibited owing to the close proximity of the docks.

The East Boston tunnel, built in 1901, was the first important example of a shield-built monolithic concrete arch, and extends from the Boston subway to East Boston It is 1·4 m. long, 3,400 ft being under the harbour. One mile was excavated by tunnelling with roof shields about 29 ft wide, through clay containing pockets of sand and gravel. The shields reacted against iron bars set in the concrete and moved forward on the masonry side walls The engineer was H. A Carson, and the contractors the Boston Tunnel Construction Company and Patrick McGovern.

A number of tunnels of marked importance, of the subaqueous shield-driven type, operated solely with electric cars (*see* ELECTRIC TRACTION) in addition to the Hudson and Manhattan tun-

TUNNEL EXCAVATING AND CONSTRUCTION

1. View of tunnel from bottom of steel caisson shaft, showing cast-iron walls of tunnel lining with conduits for electric cables. Old slip—Clark street, East River tunnel, New York city
2. Roof shield used in excavating two-track tunnel for subway in dry sand. Flatbush avenue, Brooklyn, N.Y.
3. Shield of the Holland tunnel, New York city, showing tail end of shield and part of temporary rings in shaft
4. Looking down in a completed caisson shaft, sealed against soil and water pressure at the bottom, the shield being placed in position to start tunnel excavation, Montague street, Brooklyn
5. Union tunnel, Baltimore, Md., shield driven without compressed air
6. Interior of tunnel, back of shield, after a "blowout"
7. Interior view of the Queens-Midtown tunnel, New York city, under the East river

nels already mentioned, have been built under the East and Hudson rivers at New York They are divided into two groups, those built as parts of the Pennsylvania-Long Island railroad systems, and those forming parts of the rapid transit system built by the City of New York

Of the rapid transit tunnels, the first two tubes, of 15 ft. 6 in. interior diameter and 4,150 ft long, penetrate gneiss, sand and gravel directly under the East river, between the Battery, in Manhattan, and Joralemon street, Brooklyn They were begun in 1902,

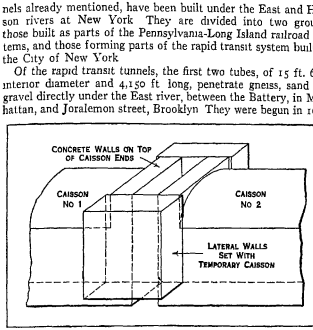

FIG. 3 —PERSPECTIVE SHOWING MANNER OF ENCLOSING SPACE BETWEEN TUNNEL CAISSONS FOR THE METROPOLITAIN UNDER THE SEINE AT PARIS

with Wm. Barclay Parsons (and later George S. Rice) as chief engineer, and were finished in Dec. 1907, under the direction of Walton I. Aims and D. L. Hough of the New York Tunnel Company, contractors Two other tubes, also of the same size, built (also through gneiss, sand and gravel) between 1905 and 1907 by the Degnon Contracting Company, with R A. Shaler as the contractors' engineer, extend from 42nd street, Manhattan, to Long Island City. These tubes were built as an independent line, but were bought and merged with the rapid transit system, under the operating contracts of 1913 Under these contracts four other tunnels each consisting of two tubes, were also driven beneath the East river, from Whitehall street, Manhattan, to Montague street, Brooklyn; Old Slip, Manhattan, to Clark street, Brooklyn, 14th street, Manhattan, to North 7th street, Brooklyn; and from 60th street, Manhattan, to Long Island City They are of larger size At the 60th and 14th street tunnels the tubes in part are above the original river bed and were built in an artificial but permanent bed of clay protected by rip-rap of stone. On both the Joralemon and Whitehall street tunnels blowouts of compressed air occurred during the progress of construction which carried workmen through to the river surface, and in each case one man survived without injury. The chief engineer for the city was Alfred Craven, and, later, Daniel L Turner The work was done between 1914–20. Under contracts let by the city for a proposed independent rapid transit system for municipal operation (Robert Ridgway, chief engineer for the board of transportation, City of New York), two other tube tunnels were constructed under the East river. from Fulton street, Manhattan, to Cranberry street, Brooklyn, and Fifty-third street, Manhattan, to, Long Island City. The 53rd street tunnel was built in part in an artificial river bottom of clay filling. A tunnel was also built under the Harlem river, from Manhattan to the Bronx, at 145th street. The greatest shield progress, that on the Whitehall-Montague street tunnel, was 95 ft in a week of six working days A pressure of 48 lb was used in the 60th street tunnel

Four somewhat larger tubes, measuring 23 ft. on the outside diameter were built under the East river in 1904–09 for the Pennsylvania and Long Island railroads. Alfred Noble was chief engineer, S. Pearson and Son, contractors, and E W. Moir was general manager for the contractors. Blowouts were prevented by placing clay blankets (sometimes 25 ft. thick) on the river bed, which could be carried up to 20 ft depth of water in the slips and back of the pierhead lines, and by filling the pores of the sand and gravel at the face of the shield with dry blue lias lime or applying plastic clay. Under the Hudson river, two tubes of the same size as those under the East river were built for the Pennsylvania trains to New Jersey

In 1914 a highway tunnel, started in 1907 and very similar to that at Glasgow, was completed in sand beneath the Elbe river at Hamburg, Germany Access is here also obtained by elevators, in shafts 1,471 ft. between centres. The shafts are 72 ft. inside and 84 ft. outside diameter and each contains four elevators for vehicles and two for foot passengers The lift is 78 feet Each of the two tubes between shafts provides for a single roadway 6 ft wide and two foot-walks 4 ft. wide. The tubes are of cast iron 19 7 ft. external diameter and the clear width inside is 14 8 feet. The lining is concrete faced with decorative tiles

The water-supply intake tunnel at Cleveland O., extends out 2 8 mi, below the surface of Lake Erie, at a depth of 95 ft below the surface and 40 to 50 ft. below the lake bottom. It was driven with a shield and compressed air in soft clay and sand The air pressure for most of the work varied from 15 to 25 lb. per square inch. The tunnel has an internal diameter of 10 ft and is lined with concrete blocks 12 in. thick.

The notable Holland tunnels connect Canal street, New York, with Twelfth street, Jersey City, passing beneath the Hudson river. For a description of these and of the Lincoln tunnel, *see* HOLLAND AND LINCOLN VEHICULAR TUNNELS The Holland tunnels are named in honour of Clifford M. Holland, the first chief engineer, who died on Oct. 27, 1924, two days before the meeting of the tubes beneath the river The tunnels consist of two tubes 1 61 mi. in length between the portals Except for the land approaches, they consist of circular cast iron rings, 29 ft in exterior diameter. They are solely for motor-propelled vehicular traffic and each tube provides for two lines of traffic in one direction only, with a roadway width of 20 feet. The tubes beneath the river were driven with shields under compressed air. The maximum grade, with traffic, is 4% and against traffic, 3 6%, both on the New York side of the river. The roadways are paved with granite blocks, and the clear headroom is

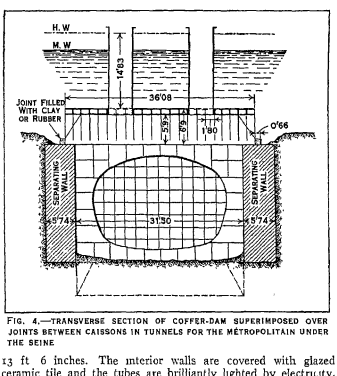

FIG. 4.—TRANSVERSE SECTION OF COFFER-DAM SUPERIMPOSED OVER JOINTS BETWEEN CAISSONS IN TUNNELS FOR THE MÉTROPOLITAIN UNDER THE SEINE

13 ft 6 inches. The interior walls are covered with glazed ceramic tile and the tubes are brilliantly lighted by electricity. The entrance and exit portals are separated at each end by two city blocks and large plazas are provided to prevent traffic congestion. Artificial ventilation is provided. The tunnels have fire fighting equipment, water lines, sand boxes, telephones, traffic signals, wrecking equipment, etc. A footwalk is provided for policing and inspection, but the tunnels are not open to pedestrians. Power for the equipment is obtained from two independent sources on each side of the river and three independent

cables from each source of supply Each cable has a capacity sufficient to carry the full load. It was estimated that the tunnels would have a traffic capacity of 1,900 vehicles per hour for each tube. About 52,000 vehicles have used the tunnels in a single day, without reaching their capacity. Construction began on July 1, 1919, and the tunnels were opened to traffic on Nov 11, 1927 The cost of construction and real estate was about $48,000,000 Tolls are collected (R Rv)

The River Mersey vehicular tunnel between Liverpool and Birkenhead, England, is the largest subaqueous tunnel in the world, having an outside diameter of 46 ft 3 in. and inside diameter of 44 ft. The main roadway is formed at about the diameter line of the tunnel, and provides for four lines of mechanically propelled traffic on a width of 36 ft. A narrow footwalk for patrol purposes is provided on each side. The whole of the upper part of the tunnel is exposed to view, there being no separate duct for the exhaust air, experiments having established this as unnecessary except near each exhaust shaft. Below the main roadway, in the portion of the tunnel under the river, there is space for a future roadway for two lines of traffic The fresh air supply ducts are also located under the roadway. The bottom of the under-river tunnel at its deepest point is 170 ft. below high water. The distance between shafts on each side of the river is 1,735 yards, and the total length of main tunnel and branch tunnels is 2 62 miles. The branch tunnels have an inside diameter of 26 ft 6 in., and only provide for two lines of traffic They have a length of 6 mile. The gradient is 1 in 30. The capacity of the tunnel is 4,150 cars per hour, 100 feet apart and moving at 20 miles per hour At this speed, the time required to pass through the tunnel is 6½ minutes 82,000 tons of cast iron were used in lining the tunnel. The tunnel was opened to traffic on July 18, 1934. The total cost of construction, including land, but excluding interest charges during construction, was £6,919,000 The Government contributed £1,500,000, and the balance was borne by the Corporations of Liverpool and Birkenhead The annual loan charges on sums borrowed are being provided by tolls to the extent of £153,000 per annum, and the remainder out of rates levied on Liverpool and Birkenhead The late Sir Basil Mott was the engineer responsible to the Tunnel Committee for the construction of the tunnel. 14,800,000 vehicles passed through the tunnel by end of November, 1938, and £1,200,000 was collected in tolls. (D. A)

Tunnels have been proposed for undersea connection between England and France, beneath the English channel, even between Alaska and Siberia and beneath the entrance to the Mediterranean at Gibraltar; but aside from the great cost, due to great length and depth, questions of national military defence arise

SINKING TUBES, CAISSONS, COFFER-DAMS, ETC.

In 1845, De la Haye, in England, doubtless having in mind the tedious and difficult work of the Thames tunnel, proposed to make tunnels under water by sinking large tubes on a previously prepared bed and connecting them together. Since then many inventors have proposed similar schemes. In 1866 Belgrand sank twin-plate iron pipes, 3.28 ft in diameter and 512 ft. long, under the Seine at Paris for a sewer siphon, and there have since been numerous examples of sunk cast iron subaqueous water-pipes.

First Subaqueous Trench Tunnel.—It is believed that the first tunnel of this class, large enough for men to move upright in, was by H A Carson, assisted by W. Blanchard and F. D Smith (in 1893–94), in the outer portion of Boston harbour, for the metropolitan sewer outlet. The later tubes were about 9 ft. exterior diameter, in sections each 52 ft long weighing about 210,000 lbs., made of brick and concrete, with a skin of wood and watertight bulkheads at each end. A trench was dredged in the harbour bed and saddles were accurately placed to support the tubes The latter, made in cradles above the water alongside a wharf, were lowered and towed ½ to ¾ m. to their final positions. After sufficient water had been admitted they were lowered to their saddles by travelling shears on temporary piles. The temporary joints between consecutive sections were made by rubber gaskets between flanges which were bolted together by divers. The later operations were backfilling the trench over the pipes and, in each section, pumping out the water, removing its bulkheads and making good the masonry between consecutive bulkheads, this masonry being inside the flanges This work, about 1,500 ft in length, was done without contractors, by labourers and foremen under the immediate control of the engineers and was found perfectly sound

The double-track railroad tunnel at Detroit, made in 1906–09, for the Michigan Central railroad, was built under the direction of an advisory board consisting of W J. Wilgus, chairman, H A

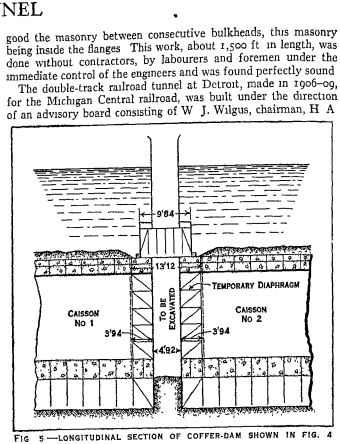

FIG 5.—LONGITUDINAL SECTION OF COFFER-DAM SHOWN IN FIG. 4

Carson and W. S. Kinnear, chief engineer The tunnel is 1 5 m. long, with a portion of 0 5 m. directly under the river A trench was dredged with a depth equal to the vertical dimension of the tunnel below the river bed and about 70 ft below the river surface and grillages were accurately placed in it to support the ends of thin steel tube forms, inside of which concrete was to be moulded and outside of which deposited. These tubes, each about 23 ft in diameter and 262 5 ft. long, were in pairs (one tube for each track) and were joined together at intervals of 12 ft by thin steel diaphragms surrounding the tubes. The planking, to limit the concrete, was secured to the outside edges of the diaphragms. The tubes were made tight, bulkheaded at their ends, floated into place, sunk by admitting water, set on the grillages and the ends of successive pairs connected together by bolts through rubber gaskets and flanges.

The second (1913–15) tunnel crossing of the rapid transit system at New York beneath the Harlem river from Lexington avenue, in Manhattan, to Mott avenue, in the Bronx, consists of four tubes 1,080 ft. long. The general design and method of construction were modifications of those used in the Michigan Central railroad tunnel at Detroit. The tunnel was built in five sections, 199 to 220 ft. in length. A trench was dredged with a width of 81 ft. and side slopes of 45°. The sections (770 tons) were erected on timber falsework and, to launch them, flat boats were run beneath the sections at low tide and the rising tide lifted them from the falsework The ends of the tubes were provided with timber bulkheads to make the tubes float, and when free from the falsework they were towed by a tug into the river, where the flat boats were scuttled and sunk by opening valves provided for the purpose. The tubes then floated on their own bottoms and were towed to the tunnel site and sunk on the timber caps provided for their support in the river The water was then pumped from the tubes and they were lined with concrete The tunnels were completed without the use of compressed air for any part of the work. Alfred Craven was chief engineer for the Public Service Commission and the contractor was the Arthur McMullen and Hoff Company.

The vehicular tunnel beneath the Detroit river, from Detroit, Mich., to Windsor, Canada, was started in 1928. It consists of one tube, 0.95 m. long between portals, with an inside diameter

of 28 ft 4 inches. The portion beneath the river, 2,500 ft long, was built by the subaqueous trench method as in the case of the Michigan Central tunnel at Detroit, and the second Harlem River tunnel, at New York. The land portions, 1,000 ft and 500 ft. in length, were shield-driven The estimated cost was $10,000,000. Because of the international character of this tunnel, it is necessary not only to provide for collection of tolls but for customs and immigration inspection, which requires unusual plaza facilities at both ends of the tunnel Parsons, Klapp, Brinckerhoff and Douglas were engineers and Porter Brothers, contractors

The largest diameter tunnel built by the subaqueous trench method is the Oakland-Alameda estuary tube, in California It is a single tube, 0.67 m in length between portals, of which 2,436 ft. is made up of 12 sections of tubes, each 203 ft long, sunk in a dredged trench, with a depth of water over the tubes of 42 feet The tube sections present the novelty of being made of reinforced concrete, 37 ft. external diameter, with a shell thickness of 30 in and they are enveloped with a membrane of three-ply waterproofing. They were cast in forms in a dry dock at San Francisco, then floated to position and sunk The tunnel has a roadway for vehicles that is 23 ft wide and also has foot-walks that are protected by railings The cost was estimated at $4 500.000 or about one-half the estimated cost if done by the shield method. C E Posey was chief engineer

Tunnelling by Sinking Caissons.—The first New York rapid transit tunnel under Harlem river, built in 1904–05, is an example of tunnel caissons built under water and in part of the work a portion of the permanent tunnel was itself made to serve as the roof of the caisson The tunnel has two tubes, each about 15 ft. in interior diameter, the portion beneath the river being 400 ft long, with a surrounding shell of cast iron itself surrounded by concrete. The outside width of concrete is about 33 feet. Its top is 28 ft. below high water and about 3 ft below the bed of the river The method of construction was devised by McMullen and MacBean, the contractors, who dredged a trench in the river to within 7 or 8 ft of the required depth They then enclosed a space of the width of the tunnel, from shore to mid-stream, with 12 in sheet piling, which was evenly cut off some 2 ft. above the determined outside top of the tunnel On top of this piling was sunk and tightly fitted a flat temporary roof of timber, 3 ft. thick in sections, which was covered with about 5 ft of dredged mud. An air lock was provided in the roof and the water was expelled from this subaqueous chamber by compressed air, after which the remaining earth was easily taken out, and the cast iron and concrete tunnel walls were then built in the chamber For the remaining part of the river the foregoing process was varied by cutting off the sheet piling at mid-height of the tunnel and making the upper half of the tunnel, which was built above and lowered in sections through the water, serve as the roof of the chamber in which the lower half of the tunnel was built in compressed air

Subaqueous tunnels are usually started from shafts near the margins of the streams and, when in soft ground, the shafts are sunk by the use of caissons under compressed air. The caissons remain as part of the permanent construction and from them the shields are started

It may therefore be said that nearly all tunnels of this class are built in part by caissons.

The tunnels of the Métropolitan railway of Paris (F Bienvenue, engineer-in-chief) under the two arms of the Seine, between Place Chatelet and Place Saint Michel, were made by means of compressed-air caissons sunk beneath the river bed, L Chagnaud being the contractor. They were built of plates of sheet steel and masonry, with temporary steel diaphragms in the ends, filled with concrete, making a cross wall with a level top about even with the outside top of the tunnel and about 2 ft below the bottom of the Seine. The caissons were sunk on the line of the tunnel so that adjacent ends and the walls just described, were nearly 5 ft. apart with (at that stage) a core of earth between them Side walls joining the end walls and thus enclosing the earth core on four sides (fig. 3) were next made by the aid of temporary small caissons sunk through about 26 ft. of earth under the river. The tops of the side walls were made even with the end walls. A steel rectangular coffer-dam (figs 4 and 5) was sunk to rest with rubber or clay joint on these surrounding walls. The coffer-dam had shafts reaching above the surface of the water, so that the earth core was easily taken out in free air, after removing the water The adjacent chambers under the caissons were then connected together Three caissons, of a total length of 396 ft were used under the large arm and two, of an aggregate length of 132 ft under the smaller arm of the Seine. Construction was started in 1905 and operation was begun in Jan. 1910, the cost of the tunnel was 2,134 francs per linear foot.

At San Diego, Calif , a tunnel 1,200 ft. long was constructed in 1928 by the caisson method. The tunnel has a cross section of 11 by 12 ft., and forms the intake for cooling water for a power plant

Tunnels Built in Coffer-Dams.—The first subaqueous highway tunnel in the United States was that at Washington street, beneath the Chicago river, in Chicago It is not properly a tunnel, having been built in a coffer-dam. It was constructed in 1866–69 and has two roadways each 11 ft. wide and 13 ft. high, and a footway 10 ft. wide and 10 ft high. It has twice been rebuilt to provide a deeper waterway, the original depth being only 14 feet After the great fire of 1871, it formed the only means of communication between the west side and the business district pending the reconstruction of the bridges In 1869–71 a similar roadway tunnel was constructed at La Salle street and in 1889–94 one at Van Buren street, both beneath the Chicago river These also required rebuilding at later dates to provide deeper waterways. All these tunnels are now used for surface cars only.

TUNNELLING BY THE FREEZING METHOD

Tunnelling by freezing the water contained in the soil, and then excavating through the frozen material in a manner similar to rock, has often been proposed. The method has been used for sinking shafts with a fair degree of success in a number of cases Siberian miners have for years taken advantage of low temperatures to penetrate saturated ground to reach mineral deposits. F. H Poetsch applied the method in 1883 in sinking a shaft in Saxony, for the Archibald mine

While fairly successful as applied to shafts, the method has rarely been used for driving tunnels and then not with entire success In 1884–86, in Stockholm, Sweden, a tunnel for pedestrians was driven in part by the freezing method by Captain Lindmark The length of the tunnel was 758 ft. and it passed beneath a ridge dividing two parts of the city. The cross section was 12 ft. 8 in. high and 13 ft 2 in. wide and the material was coarse gravel with large stones and some clay. It contained water and had very little cohesion. The material was frozen by using a dry air (Lightfoot) machine delivering 25,000 cu.ft of air per hour. The temperature of the air at the machine was —55° C Only about 80 ft. of the tunnel was constructed by this method, the balance of the soil being of firmer material

TUNNELLING THROUGH MOUNTAINS

Where a great thickness of rock overlies a tunnel through a mountain it may be necessary or advisable to do the work wholly from the two ends without intermediate shafts The problem largely resolves itself into devising the most expeditious way of excavating and removing the rock. Experience and modern mechanical devices, such as compressed air drills, and mucking and loading machines, have led to speed and economy

The Hoosac tunnel, in Massachusetts, on the line of the Fitchburg railroad, was the first prominent tunnel in America, and for many years the longest, being 4 73 m. long It was begun in 1855 and finished in 1876, after many interruptions It was memorable for the original use in America of compressed air drills and nitroglycerin, mechanical drilling being adopted in 1866.

In 1857 the first blast was fired in connection with the Mont Cenis work in the Alps, in 1861 machine drilling was introduced and in 1871 the tunnel was opened for traffic. It is located between Modane, France and Bardonecchia, Italy It is a single tunnel 7 98 m. long, with a "horseshoe" section 26 ft. 3 in. by 24 ft 7 inches. The material penetrated was granitic and the

average progress 7·7 lin ft. per 24 hours The approximate cost was £75 per linear foot. With the exception of about 900 lin.ft. the tunnel is lined throughout with brick or stone During the first four years, by hand labour, the average progress was not more than 9 in per day on each side of the Alps, but with compressed air drills the rate towards the end was five times greater.

In 1872 the St Gotthard tunnel was begun and in 1881 the first locomotive ran through it. It lies between Goschenen and Airolo, in Switzerland. It is 9·3 m in length and of the same

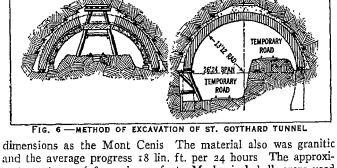

FIG. 6.—METHOD OF EXCAVATION OF ST. GOTTHARD TUNNEL

dimensions as the Mont Cenis The material also was granitic and the average progress 18 lin. ft. per 24 hours The approximate cost was £48 per linear foot Mechanical drills were used from the beginning Tunnelling was carried on by driving in advance a top heading about 8 ft. square, then enlarging this sideways and finally sinking the excavation to invert level (*See* details in fig. 6) Air for working the rock-drills was compressed to seven atmospheres by water turbines of about 2,000 horse-power The two inclines leading to the summit, which total about 36 m., are 28% tunnel, including seven spirals forming almost complete loops within the mountains, in order to gain altitude and distance

The driving of the Arlberg tunnel was begun in 1880, and the work was completed in little more than three years. It is a single tunnel, 6·36 m long, between Innsbruck and Bludenz, in the Tirol. It is 25 ft 3 in. wide and the average progress in 24 hours was 27·2 linear feet The approximate cost was £36 per linear foot The main heading was driven along the bottom of the tunnel and shafts were opened to the upper heading 75 to 210 ft. apart, from which smaller headings were driven right and left. The tunnel was enlarged to its full section at different points simultaneously in lengths of 24 ft., the excavation of each occupying about 20 days and the masonry 14 days. Ferroux percussion air drills and Brandt rotary hydraulic drills were used, the performance of the latter being especially satisfactory. After each blast a fine spray of water was injected, which assisted the ventilation materially. In the St Gotthard tunnel the discharge of the air drills was relied on for ventilation In the Arlberg tunnel over 8,000 cu.ft. of air per minute was thrown in by ventilators. To keep pace with the miners, 900 tons of excavated material had to be removed, and 350 tons of masonry introduced daily at each end of the tunnel, which necessitated the transit of 450 wagons The cost per linear foot varied according to the thickness of masonry lining and the distance from the mouth of the tunnel. For the first 3,000 ft from the entrance the prices per linear foot were £3 16s. for the lower heading; £2 11s. for the upper one; £10 3s. for the unlined tunnel; £15 for the tunnel with a thin lining of masonry; and £21 8s. with a lining 3 ft. thick at the arch, 4 ft. at the sides and 2 ft. 8 in. at the invert

The Simplon tunnel was begun in 1898 and completed in 1905 It lies between Brigue, Switzerland and Iselle, Italy It has a length of 12·3 m. and is over 30% longer than the St Gotthard The greatest depth below the surface is 7,005 feet. A novel method was introduced by driving two parallel headings (56 ft. apart, connected at intervals of 660 ft by oblique galleries), which greatly facilitated ventilation and resulted in increased economy and rapidity of construction, while also insuring the health of the men. One of the headings was enlarged at once to 16 ft. 5 in. wide by 19 ft 6 in. high, for a single track railroad, but the second was left to be enlarged and similarly used at a later date. (This was undertaken in 1918, during the World War, and completed a few years later) Had one wide tunnel been made instead of two narrow ones, it would have been difficult to maintain its integrity, even with the narrow cross section employed, the floor was forced up at points in the solid rock from the great weight above, and had to be secured by building heavy inverts of masonry About 25 m from the portal at Iselle, the "Great Spring" of cold water was struck. It yielded 10,564 gal. per minute at 600 lb pressure per square inch, and reduced the temperature to 55·4° F, the lowest point recorded A spring of hot water was met on the Italian side which discharged into the tunnel 1,600 gal per minute with a temperature of 113° F The maximum flow of cold water was 17,081 gal per minute, and of hot water 4,330 gal per minute These springs often necessitated a temporary abandonment of the work. Water-power from the Rhone at the Swiss and from the Diveria at the Italian end provided the power for operating all plants during construction of most of the work The material penetrated was gneiss, micaschist, limestone and disintegrated mica-schist The average progress per 24 hours was 35 lin ft and the approximate cost £49 7s per linear foot Among the able engineers connected with this work must be mentioned Alfred Brandt, a man of remarkable energy and ability, whose drills were used with much success He died early in the work of injuries received from falling rock.

A group of tunnels—the Tauern, Barengraben, Wocheiner and Bosruck—was undertaken by the Austrian Government in connection with new Alpine railroads to increase the commercial territory tributary to the seaport of Trieste, which at one time was greater than Hamburg

The Loetschberg tunnel, in the Alps of Switzerland, between Kandersteg and Goppersteln, is 9·04 m. long and the maximum grade 0·38% It is a double track railway tunnel, and its construction was begun in Oct 1906 and completed in Sept 1911 It was originally planned to be 8·5 m in length and straight It passed beneath the ancient glacial gorge now filled with detritus and occupied by the Kander river, but at a great depth and it was supposed it would be in solid granite After driving the heading for nearly 2 m it broke through into the gorge which was filled with sand, boulders and water under great pressure In the space of a few moments about 8,000 cu-yd of the material was carried into the heading Twenty-five men, the drills and all equipment were lost beyond hope of recovery. It was bulkheaded off and the line bent to throw it farther into the mountains and beneath the gorge and was then successfully completed, the length being increased one-half mile. The tunnel is operated electrically, using 15,000 volts, single phase, alternating current of 16 cycles

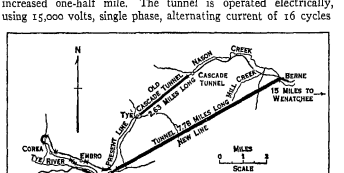

FIG. 7.—MAP SHOWING NEW AND OLD TUNNEL IN THE CASCADE MOUNTAINS, STATE OF WASHINGTON, U.S.A.

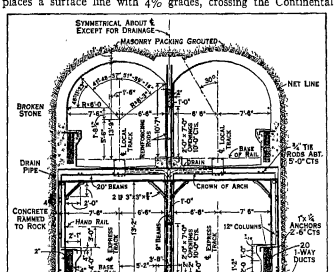


The Connaught tunnel at Rogers pass on the Canadian Pacific railway, pierces the Selkirk range of the Canadian Rockies. It is 5 m. long and replaces a surface line 540 ft higher up Its construction saves 5 m. of distance and replaced 5 m. of snow sheds in a distance of 13 miles. It is a double track tunnel, operated electrically and has a maximum grade of 2·2%. It was built between 1913 and 1916 and was the first American tunnel in which a parallel pioneer tunnel was used. Progress on the pioneer heading reached as high as 817 ft. in 30 days.

Much important tunnel construction has been done in Japan by the Japanese government railways. Probably the most notable

is the Tanna tunnel, between Atami and Mishima, which was started in 1918 and is not yet (1928) completed, as extraordinary difficulties have been encountered. The tunnel is 4,89 m in length and passes under two mountains and the valley between them. The maximum depth below the surface is 1,300 ft and below the valley 600 feet It is partly in soft ground and partly in rock. The rock is andesite. Several methods of excavation have been tried but difficulty with water prevails. At the Atami side, 17 cu ft. per second at a pressure of 240 lb per square inch enters the work, and at the Mishima side 48 cu ft. per second. The actual tost of construction up to the present (1928) has been $500 00 per linear foot.

The Liberty vehicular tunnels penetrate the south hills at Pittsburgh, Pa , and connect with the Liberty bridge, over the Monongahela river. They consist of two parallel tunnels, 59 ft. between centres, each 26 ft. 7 in wide, and 1·1 m long. Each tunnel provides a single line of street railway track not installed and two lines of vehicular traffic on a roadway 21 ft. wide There is also a foot-walk, 4 ft wide, in each tunnel. The tunnels are lined with concrete 24 in. thick. The alignment is straight and the grade continuous at the rate of 0·392%. The work was begun in 1919 and completed about three years later. The total cost was about $6,000,000 For tunnels of their size, unusually rapid progress was made in excavating which was due largely to a bonus system of paying the workmen. Eleven hours' pay was allowed for 9 ft. advance of excavation and 12 hours' for 10 ft , whether summed or not There was also sharp rivalry between the forces in the two tunnels, and the men completing their shift first were allowed to display an American flag at the entrance, the following day, while their competitors were compelled to display a black flag. The average rate of advance per day in the tunnels was over 10 ft. for a period of several months.

The Moffat tunnel, on the Denver and Salt Lake railroad, replaces a surface line with 4% grades, crossing the Continental

BY COURTESY OF N.Y. CITY BOARD OF TRANSPORTATION

FIG 8.—TYPICAL FOUR TRACK TUNNEL IN ROCK

Divide, about 50 m. west of Denver, Colo. At the time of construction it was the longest railroad tunnel in America. It lies at an elevation of 9,200 ft. above sea-level, as compared with 11,660 on the surface line at the summit of the Divide. The work was begun in 1923 and the first train was run through in Feb. 1928. The work consists of two parallel tunnels, 75 ft. apart, one for a single track railroad, 16 ft. by 24 ft. and one for a water tunnel, 8 ft. by 8 ft., which may be used for the future water-supply of the City of Denver. The work was done by the Moffat Tunnel Commission, and paid for by a bond issue by a district of the State in the vicinity and the City of Denver The railroad tunnel is leased to the Denver and Salt Lake railroad. The length of the tunnel is 6·1 m. and the cost including the water tunnel was about $15,470,000. The grades of the railroad tunnel rise from the ends toward the centre, on rates of 0·3% from the east and 0·9% from the west. The construction of both tunnels at one time was taken advantage of to use the water tunnel as a pioneer heading, with cross connections to the main railroad tunnel at intervals of about 1,500 ft., as was done in the Simplon tunnel and the Connaught tunnel at Rogers pass, which offered ad vantages in speed and ventilation. Chloride of lime dumped in one of the lakes, 1,400 ft. above, was found in the tunnel water two hours later

The new Cascade tunnel of the Great Northern railway, between Berne and Scenic, in the State of Washington, is 7·79 m. long. (*See* fig 7) It is the fifth longest railway tunnel in the world and the longest railway tunnel in America. The alignment is straight and the grade 1·565% downward to the west from Berne. Work was started in Dec. 1925. The tunnel was driven from the two portals and a shaft, 622 ft. deep, 2·41 m from the east end, by the centre heading method, to allow radial drilling. A pioneer tunnel, 66 ft. to one side and parallel with the main tunnel, was also driven, from which cross-drifts were driven at 1,500 ft. intervals. This provided a number of points of attack and insured proper ventilation and drainage. The pioneer heading has a width and height of 10 ft. and was advanced 984 ft in one month The pioneer heading was holed through in May 1928, and the main tunnel was completed during the same year and put in operation Jan. 12, 1929 The power used in construction was 2,300 volts, 60-cycle, 3-phase current. The total compressor capacity was 10,450 cu ft. of free air per minute. Haulage in the headings was by 6-ton, 250-volt trolley locomotives, and for the full section 20-ton trolley locomotives. The locomotives were equipped with gathering reels, which allowed their working 500 ft. beyond the suspended trolley. The line speed of the skip hoists at the shaft was 900 ft. per minute. A total force was employed of about 1,800 men and, because far distant from any settlement, complete camps with cottages, schools, recreation halls, stores and shops were provided, equipped with water-supply, electric lights, sewers and modern plumbing. The line through the tunnel is to be operated electrically The estimated cost is $16,000,000. (*See* ELECTRIC TRACTION) The electric railway from Eiger glacier to near the summit of the Jungfrau includes a tunnel 4.4 mi. long, 11 ft. 10 in. wide and 12 ft. 6 in high, with a midway station having arches through the side from which a large part of northern Switzerland can be seen From the Jungfrau terminus, at an elevation of 11,340 ft., an elevator operates to the Meteorological observatory on the peak of the "Sphinx," 376 ft above. The summit, at an elevation of 13,670 ft., can be reached only on foot

Among other important rock tunnels may be mentioned the Albula, through a granite ridge of the Rhaetian Alps, for a single-track narrow-gauge railroad, 3·6 m. long; the Giovi, 6 m. long, north of Genoa, Italy; tunnels on the Midland railway, near Totley in Derbyshire, over 3·5 m. long, largely in shale and at Cowburn, over 2 m. long, in shale and harder rock, each 27 ft. wide and 20·5 ft. high inside; the Arthur Pass tunnel in New Zealand, begun in 1908, 5·3 m. long, for a single track, narrow gauge railway; the Suram, on the Trans-Caucasus railway, for double track, 2·47 m. long, through soft rock; the Gravehois tunnel, on the Bergen railway, in Norway, 3·3 m. long (the longest in northern Europe); the tail-race tunnel for the Niagara Falls Power Company, being 1·3 m. long, 19 ft. wide and 21 ft. high, through argillaceous shale and limestone, costing about $1,250,000; the Tequixquiac outlet to the drainage system for the City of Mexico, 6 2 m. long, costing $6,760,000; the first Cascade tunnel, Washington, part of the Great Northern railway system, 2·63 m long and saving 9 m in distance (now replaced by a still longer tunnel, 7·79 m.); the Gunnison, 5·8 m. long, irrigating 147,000 ac. in Colorado; the double track railway tunnel of the Canadian Northern railway, under Mount Royal in Montreal, Canada, 3·5 m long; and the double track Musconetcong tunnel of the

Lehigh Valley railroad, a little less than 1 m long and costing $5,000,000, holed through in 21 months (June 1928) An example of a small tunnel of considerable length is the Strickler tunnel. It supplies water to Colorado Springs, from Pike's peak of the Rocky Mountains, in Colorado It is 1 22 m long and the cross-section is only 4 by 7 feet

For many reasons, including both safety of the work and interest charges on the capital investment, speed in tunnel construction is desirable, and such work is always pushed as fast as possible During the World War, the Northern railway of France built the Marseille-en-Beauvaisis tunnel, a single track railway tunnel, paralleling a similar one in operation and 60 ft. from it, at the rate of 16 ft per day. It is 1,200 ft long, in badly fissured chalk formation and is lined with concrete It was begun May 21, 1918, the headings met June 28 and it was in operation Aug. 4, a period of 75 days.

TUNNELLING IN TOWNS

Where tunnels have to be carried through soft soil in proximity to valuable buildings special precautions have to be taken to avoid settlement An early successful example of such work is the tunnel driven in 1886 for the Great Northern Railway Company, under the metropolitan cattle market, London. This was done by the crown-bar method, the bars being built in with solid brickwork The subsidence in the ground was from 1 to about 3½ inches Several buildings were tunnelled under without any damage

The District subway of Glasgow, Scotland, consists of a double tube line in the form of a loop, connecting Partick and the northern districts with the centre of the city. It has a length of 6·5 m., and consists in large part of circular tubes, 11 ft internal diameter, built as tunnels, lined with cast iron and driven with a shield and compressed air The line crosses twice beneath the Clyde Work was begun in 1891 and the line opened to traffic in 1897

London has now some 90 m of tunnels for railways, mostly operated by electric traction. (*See* ELECTRIC TRACTION) Most of those which have been constructed since 1890, comprising some 50 m of double tube railways, have been tunnelled through clay by the use of cylindrical shields and have linings of cast iron plates. The tubes are generally small, from 10 to 12 ft in inner diameter, but shields about 23 ft in diameter were used in constructing the stations on the Central London railway, and one 32 ft. 4 in. in diameter and only 9 ft. 3 in long was used for a short distance on the Clapham extension of the City and South London railway. The first of the London tube railways to be built was 3 5 m., of the City and South London, from the Bank under the Thames to Stockwell, begun in 1886 and completed in 1900.

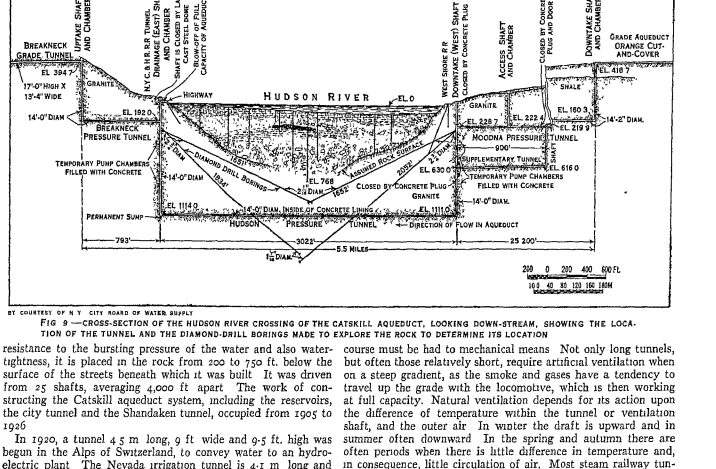
Paris has an extensive system of underground railways some 60 m in length, portions of which were built as tunnels, and a considerable number of which were constructed under the engineering direction of F. Bienvenue. The first line was built in 1898, from Porte Maillot to Porte de Vincennes, and other lines followed at later dates. Instead of using completely cylindrical shields and cast iron walls, as in London, roof-shields (*bouchers de voute*) were employed for the construction of the upper half of the tunnel, and masonry walls were adopted throughout In general, the upper half of the tunnel was executed first and the lower part completed by underpinning

In the case of the tunnelling near important buildings in Boston, in 1896, with a roof-shield 29 ft 4 in in external diameter, the vertical side walls were first made in small drifts, the roof-shield running on top of these, and the core of earth was taken out later and the invert or floor of the tunnel put in last. Each hydraulic press of the shield reacted against small continuous cast iron rods imbedded in the brick arch.

In some large sewerage tunnels in Chicago the shields were pushed from a wall of oak planks, 8 in. thick, surrounding the brick walls of the sewer. The same method was employed in constructing the portion of the Dorchester tunnel, a part of the Boston subway system, beneath Fort Point channel The length of this section was 3,060 ft. the external diameter 24 ft. 2 in. and the thickness of the wood 9 inches

The Pennsylvania railroad tunnels crossing New York city under 32nd and 33rd streets are of unusual size and excavated through mica schist Owing to the close proximity of large buildings and other structures, special methods were adopted for mining the rock to lessen the vibrations from explosions.

Quite long sections of the rapid transit system beneath the streets in New York have been built in tunnels There are about 3 m. of double tube, shield-driven tunnels in Brooklyn. Shorter sections also were built in Manhattan A portion of the line under Flatbush avenue was built in sand with a roof shield of unusual size rolling on the completed side walls, as in the case of the Boston subway. A number of the rock tunnels disclose an exceptional size On the Lexington avenue line, four tracks, two on each of two levels, are in one tunnel excavation, about 32 ft. high and wide (*See* fig. 8) The upper level is carried on steel beams supported by columns at the side and centre. The concrete roof is formed of two arches carried by columns The central portion is known as an "umbrella" section, which it resembles Beneath St Nicholas avenue and Fort Washington avenue five of the subway stations are constructed in tunnel, four of which contain two tracks and two platforms within a single arch having a clear span of 48 feet. The width of excavation required was 57 ft and the height 30 feet. In one case the arch carries a mezzanine platform the entire length of the station, supported by hangers from the roof arch alone



TUNNELS FOR CONVEYING WATER

From very early days, water has been conveyed in aqueducts formed by tunnelling, and some early examples have been mentioned. Generally such tunnels were of small cross-section, but many of them were of great length They also generally followed the grade of the flowing water and where valleys were encountered they were crossed by aqueducts of stone arches, of which examples still exist. Examples of modern tunnelling in connection with water-supply may be found in many sections of the world. Where necessary to obtain water for the supply of large cities it sometimes must be brought from great distances and the sources of supply are generally in mountainous districts.

Both the largest and longest aqueduct tunnels are those supplying water to the City of New York. They also present the novelty of sinking to great depths below the hydraulic grade line and rising again to that line to pass beneath river gorges, which are crossed at many points and also to pass beneath the entire length of Manhattan island. This introduces an internal or bursting pressure in the tunnel, which is called "a pressure tunnel."

The Croton aqueduct, from the Croton dam to the gate house at 135th street, constructed 1885–90, forms, in its completed state, a tunnel 31 m long and includes an inverted siphon or pressure tunnel, passing beneath the Harlem river. A number of short sections were built in open excavation and then covered over

The Catskill water-supply system, which extends from the Catskill mountains to New York city, a distance of about 160 m., consists in large part of true tunnels and includes both the largest tunnels for such purpose, and the longest tunnels for any purpose in the world All are concrete lined There are 25 tunnels on the hydraulic grade, with a total length of 32 m., including the tunnel beneath the Shandaken mountains, 18 1 m long, about 40 m. south-west of Albany, N.Y. It has a "horseshoe" section 11 ft. 6 in. high by 10 ft. 3 in. wide and is the longest continuous true tunnel in the world for any purpose. Seven shafts were used in constructing this tunnel There are also seven pressure tunnels crossing beneath river valleys, including that beneath the Hudson river from Storm King to Breakneck mountain, at a depth of 1,114 ft. below sea-level It is 14 ft internal diameter and 3,022 ft. between the shafts on either side of the river. (*See* fig 9) The total length of the Catskill aqueduct pressure tunnels exclusive of the city aqueduct tunnels is 17 m. and they are from 14 ft. to 17 ft. 6 in. in diameter. The city aqueduct tunnel extends from Hillview reservoir, beneath the Harlem river and nearly the entire length of Manhattan island and the East river, to shafts in Brooklyn, a distance of 18 miles It is the second longest tunnel in the world, and the longest carrying water under pressure. To provide

BY COURTESY OF N Y CITY BOARD OF WATER SUPPLY

FIG 9.—CROSS-SECTION OF THE HUDSON RIVER CROSSING OF THE CATSKILL AQUEDUCT, LOOKING DOWN-STREAM, SHOWING THE LOCATION OF THE TUNNEL AND THE DIAMOND-DRILL BORINGS MADE TO EXPLORE THE ROCK TO DETERMINE ITS LOCATION

resistance to the bursting pressure of the water and also water-tightness, it is placed in the rock from 200 to 750 ft. below the surface of the streets beneath which it was built It was driven from 25 shafts, averaging 4,000 ft apart The work of constructing the Catskill aqueduct system, including the reservoirs, the city tunnel and the Shandaken tunnel, occupied from 1905 to 1926

In 1920, a tunnel 4.5 m long, 9 ft wide and 9.5 ft. high was begun in the Alps of Switzerland, to convey water to an hydro-electric plant The Nevada irrigation tunnel is 4.1 m long and has a cross-section 9 by 9 feet. It was completed in May 1928 at a cost of $1,500,000.

TUNNELS FOR CANALS OR WATERCOURSES

Tunnels for the diversion of streams or canals are of very early date. South of Seleucia, in Turkey in Asia, a river flows through a tunnel 20 ft wide and 23 ft high, excavated 1,600 years ago through rock so hard that the chisel marks are still discernible. In 1766 a tunnel 9 ft wide, 12 ft. high and 1 63 m. long was begun on the Grand Trunk canal, England, and completed 11 years later; and this was followed by many others.

The largest of its kind is the recently completed (1927), Rove tunnel, connecting the Port of Marseilles, France, by canal with the river Rhone. It is 72 ft. wide (width of water 60 ft.) and 50 ft high inside and 4.53 m. long. The cross-sectional area is about six times that of the average double track railway tunnel. Its construction occupied 15 years, and its cost was about 135,000,000 francs, paid by the French Government, the chamber of commerce and the City of Marseilles. The entire cost is to be returned by tolls. The quantity of material excavated was greater than any other tunnel in Europe, about 2,250,000 cu.yd , or 25% more than the great Simplon tunnel. It is lined with masonry, has a tow path 6 ft wide on each side in the form of a series of small arches and has a large masonry portal at each end. This tunnel is 1.7 m. longer than a similar canal tunnel between the Marne and the Rhine.

VENTILATION OF TUNNELS

Ventilation of Steam Railway Tunnels.—The simplest method for ventilating a railway tunnel is to have numerous wide openings to daylight at frequent intervals. If these are the full width of the tunnel, at least 20 ft in length, and not farther apart than about 500 ft., a tunnel can sometimes be naturally and adequately ventilated. Such arrangements are, however, frequently impracticable, especially in long and deep tunnels, and then recourse must be had to mechanical means Not only long tunnels, but often those relatively short, require artificial ventilation when on a steep gradient, as the smoke and gases have a tendency to travel up the grade with the locomotive, which is then working at full capacity. Natural ventilation depends for its action upon the difference of temperature within the tunnel or ventilation shaft, and the outer air In winter the draft is upward and in summer often downward In the spring and autumn there are often periods when there is little difference in temperature and, in consequence, little circulation of air. Most steam railway tunnels are poorly ventilated, except where the difference in elevation of the ends or the prevailing winds, creates a natural draft through them. The need for ventilation is far greater with steam locomotion than with electric motors

The first application of mechanical or fan ventilation to railway tunnels was made in the Lime street tunnel of the London and North Western railway, at Liverpool, which has since been replaced by an open cutting. At a later date fans were applied to the Severn and Mersey railway tunnels

Where possible, the principle ordinarily acted upon, where mechanical ventilation has been adopted, is to exhaust the vitiated air at a point midway between the portals of a tunnel, by means of a shaft with which is connected a ventilating fan of suitable power and dimensions In the case of the tunnel under the Mersey river such kind of shaft could not be provided, owing to the river being overhead, but a ventilating heading was driven from the middle of the river (at which point entry into the tunnel was effected) to each shore, where a fan 40 ft. in diameter was placed In this way the vitiated air is drawn from the lower point of the railway, while fresh air flows in at the stations on each side to replenish the partial vacuum

The principle was that fresh air should enter at each station and "split" each way into the tunnel, and that thus the atmosphere on the platforms should be kept pure In the Mersey tunnel there are five fans; two are 40 ft. in diameter by 12 ft. wide and two 30 ft. in diameter by 10 ft. wide, one of each size being erected at Liverpool and at Birkenhead respectively. In addition there is a high speed fan, 16 ft in diameter, in Liverpool, which throws 300,000 cu.ft. per minute. The ventilation of this tunnel was satisfactory up to a train schedule of 300 trains per day, or one each way every five minutes. As the traffic increased the air shaft became coated with soot several inches thick and arrangements were made to instal electric power.

The central point of the Severn tunnel lies toward the

Monmouthshire bank of the river and ventilation is effected from that point by means of one fan placed on the surface at Sudbrooke Monmouth, at the top of a shaft which is connected with a horizontal heading leading to the centre of the tunnel. This fan, which is 40 ft in diameter by 12 ft. in width, removes from the tunnel some 400,000 cu.ft per minute, and draws in an equivalent volume of fresh air from the two ends.

About 1896 an excellent system was introduced by Signor Saccardo, an Italian engineer, which to a great extent minimized the difficulty of ventilating long tunnels under mountain-ranges where

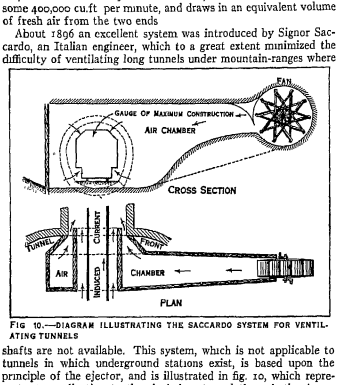


FIG 10.—DIAGRAM ILLUSTRATING THE SACCARDO SYSTEM FOR VENTILATING TUNNELS

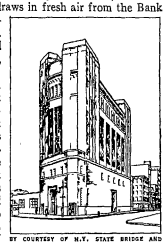
shafts are not available. This system, which is not applicable to tunnels in which underground stations exist, is based upon the principle of the ejector, and is illustrated in fig. 10, which represents its application to the single-line tunnel through the Apennines at Pracchia. This tunnel is one of 52 single line tunnels, with a gradient of 1 in 40, on the main line between Florence and Bologna, built by Thomas Brassey. There was a great deal of traffic which had to be worked by heavy locomotives Before the installation of a ventilating system, under any condition of wind, the state of this tunnel, about 9,000 ft in length, was bad; but when the wind was blowing in at the lower end at the same time that a heavy goods or passenger train was ascending the gradient the condition of affairs became very much worse. The engines, working with the regulators full open, often emitted large quantities of both smoke and steam, which travelled concurrently with the train. The goods trains had two engines, one in front and the other at the rear, and when, from the humidity in the tunnel, due to the steam, the wheels slipped and possibly the train stopped, the state of the air was indescribable A heavy train with two engines, conveying a royal party and their suite, arrived on one occasion at the upper exit of the tunnel with both enginemen and both firemen insensible; when a heavy passenger train came to a stop in the tunnel, all the occupants were seriously affected

In applying the Saccardo system, the tunnel was extended for 15 or 20 ft by a structure either of timber or brickwork, the inside line of which represented the line of maximum obstruction of the tunnel, and this was allowed to project for about 3 ft. into the tunnel (fig 10) The space between this line and the exterior constituted the chamber into which air was blown by means of a fan. Considering the length of tunnel, it might at first be thought there would be some tendency for the air to return through the open mouth, but nothing of the kind happened. The whole of the air blown by the fan, 164,000 cu.ft. per minute, was augmented by the induced current yielding 46,000 cu.ft per minute, making a total of 210,000 cu.ft.; and this volume was blown down the gradient against the ascending train so as to free the driver and men in charge of the train from the products of combustion at the earliest possible moment. Prior to the installation of this system the drivers and firemen had to be clothed in thick woollen garments, pulled on over their ordinary clothes, and wrapped round and round the neck and over the head.

The Saccardo system was installed in 1899 at the St. Gotthard tunnel with most beneficial results. The ventilating plant is situated at Goschenen at the north end of the tunnel and consists of two large fans operated by water-power The quantity of air pressed into the narrow mouth of the tunnel is 413,000 cu ft per minute at a velocity of 686 ft., this velocity being much reduced as the full section of the tunnel is reached. After installation, a sample of the air taken from a carriage contained only 10 19 parts of carbonic acid gas per 10,000 volumes

In the Simplon tunnel (12·3 m long), where electricity is the motive power, mechanical ventilation was installed at the time of construction at each end of the tunnel, both for construction purposes and to serve as permanent equipment It is based on a different principle than the Saccardo system A steel sliding door is arranged at each entrance to be raised and lowered by electric power. After the entrance of a train the door is lowered and fresh air forced into the tunnel from the same end at considerable pressure by fans Since completion of the second tunnel following the World War an additional ventilation plant has been built at the north end of the tunnel

The Moffat tunnel in Colorado (6 1 m. long) is ventilated by a mechanical plant based on the principle of forced or induced draft created at one end of the tunnel A building was erected at the east portal which forms an extension of the tunnel and provides a fan chamber on each side A vertical lift gate is provided to close the portal. Two fans are provided, which differ for experimental reasons Each has a diameter of 9 ft and width of 6 feet The motors are of 750 and 500 h.p. with capacities of 450,000 and 350,000 cu. ft. per minute, at velocities of 14 and 10 m. per hour, respectively. Only one fan is operated, the other held in reserve The ventilation is by forced draft for east bound trains and induced draft for west bound trains, which forces the smoke back along the train The results are very satisfactory



Other railway tunnels partially or completely ventilated by mechanical draft are the Giovi tunnel, in Italy; Hoosac tunnel, in Massachusetts; East Mahanoy tunnel, in Pennsylvania; Big Bend tunnel, in West Virginia, Elkhorn tunnel, in West Virginia; and the Gallitzen tunnel, in Pennsylvania.

Volume of Air Required for Ventilation of Railway Tunnels.—The consumption of coal by a locomotive during the passage through a tunnel having been ascertained, and 29 cu ft of poisonous gas being allowed for each pound of coal consumed, the volume of fresh air required to maintain the atmosphere of the tunnel at a standard of purity of 20 parts of carbon dioxide in 10,000 parts of air is ascertained as follows The number of pounds of fuel consumed per mile, multiplied by 29, multiplied by 500 and divided by the interval in minutes between the trains, will give the volume of air in cubic feet which must be introduced into the tunnel per minute.

Ventilation of Tunnels for Electric Traction.—The introduction of electric traction has simplified the problem of ventilating intra-urban railways laid in tunnels at a greater or less distance below the surface, since the absence of smoke and products of combustion from coal and coke renders necessary only such a quantity of fresh air as is required by the passengers and staff For ventilation the shallow tunnels which form the underground portions of the Metropolitan and District railways in London, open staircases, blow-holes and sections of uncovered track are relied on. When the lines were worked by steam locomotives they afforded notorious examples of bad ventilation, the proportion of carbonic acid gas amounting to from 15 or 20 to 60, 70 and even more parts in 10,000 Since the adoption of electricity as the motive power the atmosphere of the tunnels has very much improved. Samples taken from the cars in 1905 after the adoption of electricity gave as low as 11·27 parts in 10,000.

When deep level "tube" railways were first constructed in London, it was supposed that adequate ventilation would be obtained through the lift-shafts and staircases at the stations, with the aid of the piston action of the trains which, being of nearly the same cross-section as the tunnel, would, it was supposed, drive the air in front of them out of the openings at the stations they were

approaching, while drawing fresh air in behind them at the stations they had left. This expectation, however, was disappointed and it was found necessary to employ mechanical means. On the Central London railway, which runs from the Bank of England to Shepherd's Bush, a distance of 6 m., the ventilating plant installed in 1902 consists of a 300 h.p. electrically driven fan, which is placed at Shepherd's Bush and draws in fresh air from the Bank end of the line and at other intermediate points. The fan is 5 ft. wide and 20 ft. in diameter, and makes 145 revolutions a minute, its capacity being 100,000 cu.ft a minute. It is operated from 1 to 4 A.M and, the openings at all the intermediate stations being closed, it draws fresh air in at the Bank station. The tunnel is thus cleared out each night, during the period when trains are not operated, and the air is left in the same condition as it is outside. The fan is also worked during the day from 11 A.M to 5 P.M., the intermediate doors being open. In a number of the later tube railways in London—such as the Baker street and Waterloo, and the Charing Cross and Hampstead lines—electrically driven exhaust fans are provided at about half-mile intervals; these each extract 28,500 cu.ft of air per minute from the tunnels and discharge it from the tops of the station roofs.

BY COURTESY OF H.Y. STATE BRIDGE AND TUNNEL COMMISSION

BUILDING FOR THE HOUSING OF THE MACHINERY BY WHICH FRESH AIR IS FORCED INTO THE HOLLAND TUNNEL AND USED AIR WITHDRAWN

The Boston system of electrically operated subways and tunnels is ventilated by electric fans capable of completely changing the air in each section about every 15 minutes. Air admitted at portals and stations is withdrawn midway between stations.

In the southerly 5 m of the first rapid transit subway at New York, constructed between 1900 and 1904, which is a four track structure of rectangular section, having the area of 650 sq ft. and built as close as possible to the surface of the streets, ventilation by natural means through the open staircases at the stations was at first relied upon. The results were satisfactory as regards the proportions of carbonic acid gas found in the air, but when intensely hot weather prevailed the tunnel air was sometimes 5° hotter still, due to the conversion of electric energy into heat. Ventilation chambers were added on each side of the subway at points between stations, and the condition became much improved. These chambers are beneath the sidewalks and covered by gratings, and they have been incorporated in the construction of all subways built later. In addition, a partition wall separates trackways for trains running in opposite directions and the piston action of the trains induces a satisfactory circulation of the air.

Ventilation of Vehicular Tunnels.—The need of mechanical ventilation of vehicular tunnels is a development of the last generation due to the advent of vehicles propelled by internal combustion engines. The exhaust from such engines contains smoke and gases, which are irritating to the eyes and also contains a considerable percentage of carbon monoxide, a highly poisonous gas. The first studies of the need of ventilation for vehicular tunnels were undertaken in connection with the construction of the Holland tunnel, at New York, because of its length and the large volume of traffic which was expected to use it. At that time (1920) natural draft was relied upon for the ventilation of all such tunnels in operation, including the Blackwall and Rotherhithe tunnels, in London, which were by far the most important. The traffic in them, however, was only about 100 motor vehicles per hour for each tunnel, compared with an estimated traffic of 1,900 motor vehicles per hour in each tube of the Holland tunnel. Research studies and exhaustive tests were made for this tunnel with the co-operation of the U.S. Bureau of Mines to determine first, the amount and composition of exhaust gases from motor vehicles; second, the physiological effects of these gases and third, the friction losses and power required to handle large quantities of air through concrete ducts.

In the Holland tunnel, the transverse system of ventilation was adopted. The fresh air is introduced continuously along each tube, from conduits provided for the purpose, and taken off at frequent intervals at opposite points. The air therefore travels a course transverse to that of the vehicles and there is a practically equal degree of purity at all points in the tubes. Because carbon monoxide is lighter than air and the exhaust motor gases are warmer than the fresh air introduced in the tunnel and therefore tend to rise, the fresh air ducts are placed beneath the roadways and the exhaust ducts above the roadway ceiling but all in the same tunnel tube. The fresh air is introduced in each roadway by continuous slots along each side above the floor, and the vitiated air is exhausted through louvers in the roof at 15 ft. intervals. The entire tunnel atmosphere is completely changed every 1¾ minutes or 40 times per hour, but so uniformly and gently that the current is hardly perceptible. This eliminates the fire hazard incident to a longitudinal circulation of draught. There are four ventilation shafts, one at each pierhead line and one about midway between the pierhead and portal on each side of the river. The fans are located in the shaft buildings and there are 84 in all, one-half blowers and one-half exhausters

The Liberty tunnels were the first long vehicular tunnels in which artificial ventilation was used. The method adopted is the longitudinal draft system, based on Saccardo's, with modifications by C. S. Churchill. The flow of air in each tunnel is with the traffic, and is induced from a shaft near the centre of each tunnel. Each shaft is divided into two compartments, one of which is used to exhaust the air which enters at the portal from the first half of the tunnel, and the other to blow fresh air into the tunnel at the centre and force it forward to the exit portal Suitably designed nozzles at the centre of the tunnels, at the shafts, prevent the mixing of the air being introduced and ejected. The flow of air is continuous in each tube in opposite directions and wind pipes are provided at the exit of each tube to prevent interference with the ventilation by adverse winds. The ventilating plant and fans are on the hilltop near the centre of the tunnels, at the shafts. The plant was designed to provide for a double line of motor cars in each tube, spaced 200 ft., moving at 15 m. per hour and a proportion of carbon monoxide at 8 parts in 10,000 at the point of exit, the average, therefore, being 3 parts in 10,000. This required the supplying of 280,000 cu.ft. of air per minute in each tube at a velocity of 6 m per hour. (*See* also ELECTRIC TRACTION; TRANSPORT; AQUEDUCTS; etc.) (R. RY.)

TUNNY or BLUEFIN TUNA (*Thunnus thynnus*), the largest of the tunas. It grows to a large size, in some parts of the world reaching a length of over 10 ft. and a weight of 1,500 lb. It is robust in form, has a short pectoral fin, is bluish above, grey spotted with silver below. It is world-wide in distribution and generally is found in more temperate waters than are the other tunas. It is excellent as food and the object of important fisheries in the Mediterranean, in California and in Japan. Anglers, ranking this fish among the greatest trophies obtainable, pursue it in many parts of the world with rod and reel. Large specimens are often called horse mackerel (*See* also TUNA)

TUNSTALL (or TONSTALL), **CUTHBERT** (1474–1559), English prelate, natural son of Thomas Tunstall of Thurland Castle, Lancashire, seems to have studied at Oxford, at Cambridge and at Padua. Having held several livings in quick succession, he became chancellor to William Warham, archbishop of Canterbury,

in 1511 He was employed on diplomatic business by Henry VIII and Wolsey, being sent to Brussels in 1515 and to Cologne in 1519, while he was at Worms during the famous Diet of 1521 In 1516 he had been made master of the rolls, in 1521 he became dean of Salisbury; in 1522 bishop of London, and in 1523 keeper of the privy seal. For Henry VIII he negotiated with Charles V after his victory at Pavia in 1525 and he helped to arrange the Peace of Cambrai in 1529. In 1530 he succeeded Wolsey as bishop of Durham Tunstall adhered firmly to the traditional teaching of the Church, but after some slight hesitation he accepted Henry as its head and publicly defended this position. In 1537 the bishop was appointed president of the new council of the north, but although he was often engaged in treating with the Scots he took part in other public business and attended parliament, where in 1539 he participated in the discussion on the bill of six articles. Although he disliked the religious policy pursued by the advisers of Edward VI. and voted against the first act of uniformity in 1549, he continued to discharge his public duties without molestation until after the fall of the protector Somerset; then in May 1551, he was placed in custody A bill charging him with treason was introduced, but the House of Commons refused to pass it; he was, however, deprived of his bishopric in October 1552. On the accession of Mary in 1553 he was released and was again bishop of Durham, but during this reign he showed no animus against the Protestants When Elizabeth came to the throne he refused to take the oath of supremacy, and he would not help to consecrate Matthew Parker as archbishop of Canterbury He was placed under arrest at Lambeth, where he died on Nov. 18, 1559.

Among Tunstall's writings are *De veritate corporis et sanguinis domini nostri Jesu Christi in eucharistia* (1554), and *De arte supputandi libri quattuor* (1522). The bishop's correspondence as president of the council of the north is in the British Museum.

TUNSTALL, former market town of Staffordshire, England, and one of those which amalgamated to form Stoke-on-Trent (*q v*), of which it is in the Burslem parliamentary division. The town is of modern growth. The Victoria Institute (1889) includes a library and schools of art and science The neighbourhood is full of collieries, ironworks and potteries Kidsgrove, Chatterley and Talk-o'-th'-hill are large neighbouring villages. There are brick and tile works in Tunstall, but the chief manufacture is earthenware Primitive Methodism originated here.

TUPELO, a city of northeastern Mississippi, U S A , on the west fork of the Tombigbee river, the county seat of Lee county It is at the intersection of federal highways 45 and 78, and is served by the Frisco and the Gulf, Mobile and Ohio railways. Pop. (1950) 11,507; (1940) 8,212 by the federal census It has the largest weekly cattle auctions in the United States

TUPIAN (Tupi), a group of tribes of South American Indians, occupying at the time of the first European contact a narrow and probably continuous strip of the Brazilian coast, from the vicinity of Rio de Janeiro northward nearly to the mouth of the San Francisco river. The original home of this stock probably lay in southern Matto Grosso and Paraguay.

The Tupi tribes were everywhere sedentary or semi-sedentary agriculturalists, hunters and fishermen, but on the Atlantic coast fish was almost the staple food As a rule they wore very little clothing, made much use of feather ornaments and decoration, and wore small labrets in the lower lip. They lived in large communal houses of light construction, although some had the walls of wattle and daub, and protected their often large villages by means of palisades. Their weapons were the bow and club, but they made no use of poison on their arrows They were skilled canoemen, and their vessels carried as many as 60 men. The Tupi tribes were warlike, and strongly organized for war, and commonly ate their prisoners. The dead had their burial in large pottery urns. The language of the coastal Tupis was adopted by the Jesuit missions as a lingua franca throughout a large part of Brazil, and this in time grew into the still considerably used *lingua geral.*

See C. F P von Martius, *Beitrage zur Ethnographie und Sprachenkunde Amerikas,* etc. (Leipzig, 1867); H von Ihering, *The Anthropology of the State of S. Paulo, Brazil* (São Paulo, 1906).

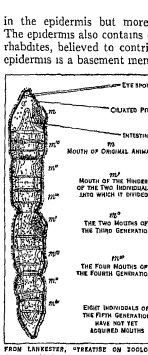
TUPPER, SIR CHARLES, BART. (1821–1915), British colonial statesman, son of the Rev Charles Tupper, D D , was born at Amherst, Nova Scotia, on July 2, 1821, and was educated at Horton Academy. He afterwards studied for the medical profession at Edinburgh University, where he received the diplomas of M.D. and L R C S. In 1855 he was returned to the Nova Scotia Assembly for Cumberland county In 1862 he was appointed governor of Dalhousie College, Halifax; and from 1867 till 1870 he was president of the Canadian Medical Association. Tupper was a member of the executive council and provincial secretary of Nova Scotia from 1857 to 1860, and from 1863 to 1867 He became prime minister of Nova Scotia in 1864, and held that office until the Union Act came into force on July 1, 1867, when his government retired He was a delegate to Great Britain on public business from the Nova Scotia government in 1858 and 1865, and from the Dominion government in March 1868. Tupper was leader of the delegation from Nova Scotia to the Union conference at Charlottetown in 1864, and to that of Quebec during the same year, and to the final colonial conference in London, which assembled to complete the terms of union, in 1866–1867. He was sworn a member of the privy council of Canada, June 1870, and was president of that body from that date until July 1, 1872, when he was appointed minister of inland revenue This office he held until February 1873, when he became minister of customs under Sir John Macdonald, resigning with the ministry at the close of 1873. On Sir John's return to power in 1878, Tupper became minister of public works, and in the following year minister of railways and canals Tupper was the author of the Public Schools Act of Nova Scotia, and had been largely instrumental in moulding the Dominion Confederation Bill and other important measures Sir Charles represented the county of Cumberland, Nova Scotia, for thirty-two years in succession—first in the Nova Scotia Assembly, and subsequently in the Dominion parliament until 1884, when he resigned his seat on being appointed high commissioner for Canada in London

Shortly before the Canadian Federal elections of February 1887, Tupper re-entered the Conservative cabinet as finance minister. By his efforts the Canadian Pacific railway was enabled to float a loan of $30,000,000, on the strength of which the line was finished several years before the expiration of the contract time. He resigned the office of finance minister in May 1888, when he was reappointed high commissioner for the Dominion of Canada in London Tupper was one of the British plenipotentiaries to the Fisheries Convention at Washington in 1887 When the Dominion cabinet, under Sir Mackenzie Bowell, was reconstituted in January 1896 Tupper accepted office, and in the following April he succeeded Bowell in the premiership On both patriotic and commercial grounds he urged the adoption of a preferential tariff with Great Britain and the sister colonies. At the general election in the ensuing June the Conservatives were severely defeated, and Tupper and his colleagues resigned, Sir Wilfrid Laurier becoming premier At the next general election, in 1900, Tupper, long the Conservative leader, sustained in his own constituency of Cape Breton his first defeat in forty years.

See his *Recollections of Sixty Years* (1914); and E M. Saunders, *Life and Letters of Sir Charles Tupper* (2 vols, 1916).

TUPPER, MARTIN FARQUHAR (1810–1889), English writer, the author of *Proverbial Philosophy,* was born in London on July 17, 1810, the son of a doctor of Huguenot descent He was educated at Charterhouse and at Christ Church, Oxford. He was called to the bar at Lincoln's Inn, but never practised. He began a long career of authorship in 1832 with *Sacra Poesis* and in 1838 he published *Geraldine, and other Poems,* and for fifty years was fertile in producing both verse and prose; but his name is indissolubly connected with his long series of didactic moralisings in blank verse, the *Proverbial Philosophy* (1838–67) which for about 25 years enjoyed an extraordinary popularity. The first part was, however, a comparative failure, and N. P. Willis, the American author, took it to be a forgotten work of the 17th century He died at Albury, Surrey, on Nov. 29, 1889

TURA, COSIMO (1430–1498), founder of the Ferrarese school of painting, was born at Ferrara and in his youth appears



to have visited Padua and Venice He spent most of his life at Ferrara, where he was court painter to the dukes Bono and Ercole. Between 1465 and 1467 he decorated the library of the Palcos of Mirandola with allegorical figures. These works, now destroyed, were described at length by Lilius Gregorius Giraldus (*Ferrarensis Historiae Poetarum*, Basle 1580). The decorations of Duke Borso's chapel at Belriguardo have also perished. In 1469 he painted the organ shutters in the cathedral of Ferrara These two panels, representing an "Annunciation" and a "St. George slaying the Dragon" are still extant The Berlin museum has one of the most important works of the master, "The Virgin and Child Enthroned and saints" Another notable work is the "Madonna and Child enthroned surrounded by six angels playing on musical instruments" (National Gallery, London) This painting was the central panel of an altarpiece of which the lunette representing "the Pietà" is in the Louvre, and one of the wings representing "a monk kneeling and two saints" is in the Colonna collection. Rome. Other notable works are the "St. Jerome" (National Gallery, London), the "Pietà" in the Correr Museum, Venice, and a madonna at Bergamo.

See E. Gardner, *The Painters of the school of Ferrara* (1911).

TURBELLARIA, a class of flatworms or Platyhelminthes (*q v*) in which the body is unsegmented and covered with a ciliated epidermis, and an alimentary canal is generally present. Almost all the group are free-living.

General Morphology.—The body is either subcylindrical or flattened and leaflike or ribbonlike. In length the species range from a fraction of a millimetre to about 20 cm. (7.87 in) In many forms there is a flat creeping (ventral) surface. At or near the anterior end there may be a pair or more of tentacles, and a pair of eyes, or numerous eye spots The margins of the body, in some of the leaflike aquatic forms, are very mobile and can be thrown into undulations, enabling the animal to swim The dorsal surface of the body is often pigmented, and the colours and markings, especially in terrestrial forms, may be very striking and brilliant. In certain aquatic species a green or brown colour is produced by the presence in the tissues of symbiotic green or brown algae.

The body is clothed in a cellular or syncytial epidermis, which may be completely ciliated but often lacks dorsal cilia. It gives off a mucoid slime that comes from gland cells sometimes situated in the epidermis but more often located in the parenchyme. The epidermis also contains elongated densely staining bodies, the rhabdites, believed to contribute to slime formation. Below the epidermis is a basement membrane, and below this various layers of muscle fibres (circular, longitudinal and usually also diagonal). As in the other classes of Platyhelminthes, the internal organs are embedded in parenchymatous tissue.

FROM LANKESTER, "TREATISE ON ZOOLOGY" (A. & C. BLACK LTD.)

FIG 2.—RHABDOCOELAN TURBELLARIAN (MICROSTOMA LINEARE) UNDERGOING THE PROCESS OF REPRODUCTION BY DIVISION

The mouth may be located anywhere along the midventral line but is usually more or less central. It leads, usually through a muscular pharynx, often more or less protrusible, into the intestine, except in the order Acoela, which primitively lack an intestine and in which food is taken into the interior parenchymatous mass. The intestine may be a simple sac or may be lobed or highly branched and as a rule, has no opening to the exterior except the mouth.

The nervous system consists of paired anterior ganglia lying ventrally to the gut, and giving off various lateral, dorsal and ventral fibres which are interconnected by other fibres Tactile organs are generally distributed over the skin, and may take the form of special hairlike cilia Other sensory organs also occur in the form of statocysts, ciliated cephalic pits or grooves, and eyes The eyes are usually pigment cups containing the bulbous free ends of the retinal cells, notable for their rod border An excretory system of the platyhelminth type with flame cells is usually present. The ex-

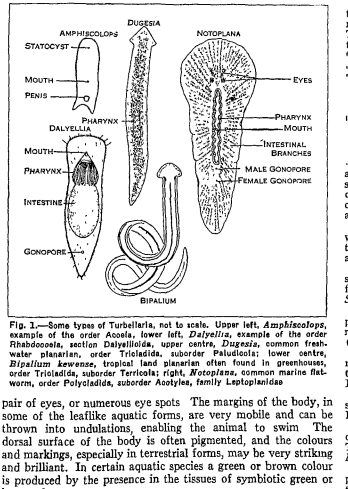


FIG. 1.—Some types of Turbellaria, not to scale. Upper left, *Amphiscolops*, example of the order Acoela, lower left, *Dalyellia*, example of the order Rhabdocoela, section Dalyellioida, upper centre, *Dugesia*, common freshwater planarian, order Tricladida, suborder Paludicola; lower centre, *Bipalium kewense*, tropical land planarian often found in greenhouses, order Tricladida, suborder Terricola; right, *Notoplana*, common marine flatworm, order Polycladida, suborder Acotylea, family Leptoplanidae

The body is clothed in a cellular or syncytial epidermis, which may be completely ciliated but often lacks dorsal cilia. It gives off a mucoid slime that comes from gland cells sometimes situated

Classification.

Acoela.

a frontal cluster of glands Without excretory system. Gonads consist of strands of differentiating sex cells not delimited from the parenchyme Oviducts absent but male ducts and simple penis present The chief families are the Proporidae without, and the Convolutidae with, a seminal bursa, *i.e.*, a sac for receiving the partner's sperm.

Order 2. **Rhabdocoela.**—Small worms, marine, brackish or freshwater with complete digestive tract; intestine a simple blind sac or tube With excretory system and usually with oviducts. Seldom with a statocyst Gonads few, mostly compact

Suborder 1 Catenulida.—Fresh-water forms with simple pharynx, single median nephridium, no yolk glands. Asexual reproduction by fission. One family, Catenulidae, represented by the very common *Stenostomum*

Suborder 2 Macrostomida.—Fresh-water or marine, with simple pharynx, paired nephridia, no yolk glands Two families, Macrostomidae without, and Microstomidae with, asexual reproduction by fission (fig. 2).

Suborder 3. Lecithophora.—Fresh-water, marine or terrestrial rhabdocoels with bulbous pharynx and yolk glands more or less distinctly separated from the ovaries Reproduction exclusively sexual Includes numerous families

Section 1 *Dalyelloida.*—Rhabdocoels with a dolniform (cask-shaped) pharynx, oriented parallel to body surfaces. Chief family, Dalyellidae, with complicated male apparatus.

Section 2 *Typhloplanoida.*—Rhabdocoels with a rosulate (spherical) pharynx oriented at right angles to body surfaces. Chief family, Typhloplanidae with genera *Mesostoma, Typhlopiana, Castrada, Phaenocora*, etc.

Section 3 *Kalyptorhynchia.*—Mostly marine rhabdocoels with a protrusible food-catching proboscis at the anterior tip (in addition to the usual pharynx). Represented by *Gyratrix, Polycystis, Acrorhynchus*, etc

Suborder 4. Temnocephalida.—Ectocommensal fresh-water rhabdocoels of dalyellioid affinities living on crayfish and other fresh-water animals. Found only in tropical and subtropical countries. The body

has 2 to 12 fingerlike tentacles and one or more adhesive disks.

Order 3. **Alloeocoela.**—Slightly larger worms mostly of plump, cylindroid form, with simple or slightly lobulated intestine. Mostly with two ovaries and numerous testes. Chiefly marine, a few in fresh water. Represented by *Prorhynchus, Plagiostomum, Cylindrostomum, Monoecha, Bothroplana*, etc.

Order 4. **Tricladida.**—Larger worms of flattened elongated form with phcate pharynx and three-branched intestine (fig. 3). With two ovaries, few to many testes, distinct yolk glands, copulatory sac for receiving sperm, and single gonopore behind the mouth.

Suborder 1. Maricola.—Marine planarians with copulatory sac behind the male apparatus. *Procerodes*, free-living, and *Bdelloura, Syncoelidium, Ectoplana* epizoic on the horseshoe crab, *Limulus*.

Suborder 2. Paludicola.—Fresh-water planarians with copulatory sac anterior to the penis. Familiar animals of ponds and streams; *Planaria, Phagocata, Dendrocoelum*, etc.

Suborder 3. Terricola.—Terrestrial planarians of tropical and subtropical jungles, sometimes reaching great lengths, often with bright colour patterns. *Geoplana, Bipalium, Rhynchodemus*, etc.

Order 5. **Polycladida.**—Marine, often large, much flattened and leaflike flatworms with numerous eyes and much-branched intestine radiating from the pharynx to the periphery.

Suborder 1. Acotylea.—Without a ventral sucker. Pharynx mostly rufiled, mouth not near anterior end Tentacles when present borne near the brain. Stylochidae, Leptoplanidae, Planoceridae, etc.

Suborder 2. Cotylea.—With a ventral sucker behind the genital pores. Pharynx rufiled or cylindrical. Mouth anterior. Tentacles when present occur on the anterior margin. Pseudoceridae, Euryleptidae, Prosthiostomidae, etc.

The classification proposed by Meixner (*Die Tierwelt der Nord-und Ostsee*, Teil iv b) differs in that the first three suborders of the Rhabdocoela are raised to the rank of orders and the Tricladida are made a suborder under Alloeocoela. While there are justifications for these changes, it seems best to adhere to the older classification.

Occurrence and Habits.—Most Turbellaria are aquatic. They are abundant on the seashore and in fresh water, where they lurk among weeds or under stones, and in the crannies of rock pools. They creep by a gliding movement caused in the smaller forms by ciliary action, in the larger ones by muscular waves; some are able to swim. Many species of triclads are terrestrial. These occur in damp localities and chiefly in tropical or subtropical countries, though a few are known in temperate latitudes. They are somewhat slughike in form and habits. A few Turbellaria, mostly dalyellioid rhabdocoels, are parasitic. These are marine, and are found in such animals as sea-urchins, holothurians and molluscs. The free-living forms are almost all carnivorous, feeding either on microscopic organisms or on worms, molluscs and insects. The protrusible pharynx is used either to engulf the prey whole or to pierce it and suck up its juices after it has been enveloped in a coating of mucus.

Development and Life History.—The development of most of the Turbellaria is direct (*i.e.* without metamorphosis). In certain polyclads, however, the embryo develops into a swimming larva ("Müller's larva") provided with eight ciliated lobes, and somewhat resembling the trochophore larvae of certain annelids. In the Rhabdocoela the eggs are generally enclosed in shells, each being provided with a number of separate yolk cells. In the Acoela and Polycladida the ova themselves may contain yolk granules, and the eggs are usually laid in clumps surrounded by a gelatinous envelope. The ova of triclads are laid, several together, surrounded by amoeboid yolk cells, in a cocoon.

A form of asexual multiplication occurs in certain rhabdocoels (Microstomidae) and triclads. In the former the body becomes constricted in the middle and forms two complete animals, each of which again subdivides, and so on, until a whole chain of individuals is formed, head to tail, eventually breaking up into separate organisms. In some of the triclads spontaneous fragmentation may occur, with regeneration of the parts to form complete animals. But even forms which at one season reproduce in this manner, do so at another by means of eggs. In certain rhabdocoels (*e.g. Mesostoma*) two distinct types of eggs are produced according to the season. During warm weather the eggs laid are thin-shelled "summer eggs" which develop rapidly, while thick-shelled "winter eggs," whose contents remain longer in a resting condition, are laid in cold weather. In other cases the eggs are apparently similar at all seasons, but develop more rapidly in warm water than in cold. Thus in shallow pools subject to sudden and frequent changes of temperature, the population increases rapidly during warm weather, while during cold spells the survival of the race is assured. (*See* Platyhelminthes.) (H. A. B.; L. H. H.)

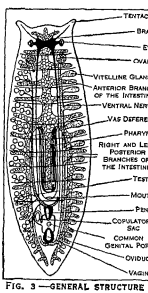

FIG. 3.—GENERAL STRUCTURE OF A TRICLADID TURBELLARIAN. THE THREE-BRANCHED INTESTINE IS CHARACTERISTIC OF THIS GROUP

TURBERVILLE (or Turbervile), **GEORGE** (1540?–1610?), English poet, second son of Nicholas Turberville of Whitchurch, Dorset, belonged to an old Dorsetshire family, the D'Urbervilles of Thomas Hardy's novel, *Tess*. He became a scholar of Winchester college in 1554, and in 1561 was made a fellow of New college, Oxford. In 1562 he began to study law in London, and gained a reputation, according to Anthony à Wood, as a poet and man of affairs. He accompanied Thomas Randolph in a special mission to Moscow to the court of Ivan the Terrible in 1568. Of his *Poems describing the Places and Manners of the Country and People of Russia* (1568) mentioned by Wood, only three metrical letters describing his adventures survive, and these were reprinted in Hakluyt's *Voyages* (1589). His *Epitaphs, Epigrams, Songs and Sonets* appeared "newly corrected with additions" in 1567. In the same year he published translations of the *Heroycall Epistles* of Ovid, and of the *Eglogs* of Mantuan (Gianbattista Spagnuoli, called Mantuanus), and in 1568 *A Plaine Path to Perfect Vertue* from Dominicus Mancinus. The *Book of Falconry or Hawkeing* and the *Noble Art of Venerie* (printed together in 1575) may both be assigned to Turberville. He probably died before 1611.

TURBET I HAIDARI, a town in the province of Khurasan in Iran, situated at an elevation of 4,400 ft., about 76 mi. S. of Meshed, on the motor road to Zahidan (Duzdab), via Qain and Birjand.

The town is a centre of many roads. In the northeast are the ruins of an old citadel, or the Ark of Ishaq Khan; but the principal feature of the town is its bazaar formed of four domevaulted streets radiating from a larger central dome. Before the famine of 1871, Turbet i Haidari was populous, but the population was, it seems, reduced by 20,000. The town had recuperated before World War I owing to increased trade between Russian Turkistan and Afghanistan; the population (est. 1944) is about 12,000, chiefly of Turki Qarai stock, who were settled there by Timur in the 14th century; but many of the merchants and artisans are Yazdis.

The surrounding district is very fertile and much wheat and barley are sent to other parts. The chief trading activities are wool buying, silk production (now greatly declining), carpet buying from the Baluch nomads round about, and the making of copper utensils.

The town, formerly known as Zavah, derives its name from the *turbeh*, or tomb, of a holy man named Qutb ud Din Haidar, the founder of the ascetic sect of dervishes known as Haidaris, who died *c.* 1230 and is buried in a domed building just outside the town.

TURBINE: STEAM. A turbine is a rotary motor in which the shaft is rotated steadily in its bearings, not by means of cranks as for example in a reciprocating engine (*see* Steam Engine), but by a current of water, air, steam or any other fluid. Thus a steam turbine is a "prime mover" which generates motive power in the same manner as the familiar country-side "wind mill," which is used for grinding corn or pumping water. Instead of a current of air being used to rotate the shaft by means of "sails" as in a "windmill," a current or blast of steam issuing from a number of fixed nozzles, is employed to rotate the shaft of a steam turbine by means of "vanes," "buckets" or "blades."

The relatively small power obtainable from the wind with a reasonable sail area, and the discontinuity of the breeze, render the windmill of comparatively little economic importance, but with the steam turbine on the other hand, the matter is very different. Not only is there the convenience of uniform rotary motion applied to a shaft direct, but also the powerful and unfailing steam blast generated with coal or oil fired boilers, and the enormous power output obtainable from a turbine of very moderate dimensions.

The economic value of the steam turbine has, therefore, been

the incentive to its development to the utmost, and its evolution has been carried out in the face of all obstacles,—a story worthy of an epic of mechanical engineering—for many years almost entirely owing to the efforts of the Hon. Sir Charles A. Parsons, O M , K C B , etc , and his associates and in more recent years by a host of other workers as well.

General Mechanical Features.—In the steam turbine, in which a pure twist or driving torque is the only force applied to the shaft, the entire mechanism may be described under the following six headings.

(1). The system of "blading" by means of which the motive power is produced. The term "blading" (as distinct from "blades") is used to denote collectively the fixed nozzles and the rotating "vanes" or "blades"

(2). The rotating shaft, or "rotor," which carries the rotating elements of the blading, and collects and transmits the driving torque.

(3). The casing, which carries the nozzles or fixed elements of the "blading," balances or provides the reaction to the driving torque (*see* torque tube in a motor car), and embodies the supports or bearings for the rotor

(4). The speed-regulating mechanism.

(5). The lubricating system for the bearings.

(6). The coupling between the rotor and the apparatus intended to be driven by it

The blading may consist of a set of fixed nozzles (*see* fig 1) directing high-velocity steam jets on to "vanes" or "blades" mounted round the rim of the wheel If there were no blades or other obstructions in front of the steam jets, the latter would travel forward in a straight line The curved surfaces of the blades, however, forcibly deflect the jets from the free path, the blades themselves receiving in consequence an "impulse" in the direction opposite to the deviation which they produce Hence the name "impulse turbine" applied to a turbine of this kind The steam jets in passing through the blade passages and doing work on the wheel, will be continuously slowed down and will leave the moving blades with a velocity much less than the initial

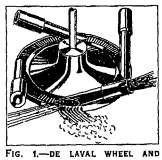

FIG. 1.—DE LAVAL WHEEL AND NOZZLES SHOWING DEVIATION OF THE STEAM JETS BY THE BUCKETS

Special Difficulty of the Problem.—Such a very simple arrangement (the counterpart of the well-known Pelton water wheel for utilizing waterfalls) although widely adopted for small powers, is not applicable to large powers

The underlying reason for the unsuitability of the simple steam-wheel as compared with the water wheel is to be found from a comparison of the physical properties of steam and water. Water is an in-elastic fluid; that is, it has practically the same density (weight per cubic foot) at all pressures, and in a water turbine, the water jet velocity generated by a given fall in pressure is determined from the static head corresponding to that pressure If h is the height of a column of water, the difference of pressure between the top and the base of the column is that due to the weight of the water in the column pressing on an area equal to the sectional area at the base. Denoting this sectional area by A then hA=the volume of the water, the weight of the column ρh A, and p, the pressure per unit area at the base, =ρh where ρ is the density or weight per unit volume.

The jet velocity due to such a head of water is the same as that acquired by a body falling freely through the height h under gravity viz., $\sqrt{2gh}$ thus $V^2=2gh=2g\left(\frac{p}{\rho}\right)$. Each pound of water coming in at the top of the column and discharged at the base with velocity V has lost potential energy gh and gained an equivalent amount of kinetic energy $\frac{1}{2}V^2$ This is the energy per pound which would be available for use in a water turbine.

The static head of water corresponding to a pressure of 265 lb. per sq. inch would be 610 feet and the velocity due to this head 198 feet per second.

With a fluid of less density, a longer column would be required in order to have the same pressure at the base. In other words the same pressure would then correspond to a greater static head Considering steam at, say, 265 lb per sq. inch and a temperature of 700° F, the density of the steam is $\frac{1}{160}$ of that of water and it would therefore require at that density a column 160 times the height to give the same pressure, or $160\times 610=97{,}600$ ft. But this is not all. Steam, in contrast with water, is a highly elastic fluid, and the effective head in steam would be even greater than 97,600 ft, because of the expansion in volume which takes place as the pressure falls. During this process, successive decrements of pressure, associated with successively decreased density, contribute increasing amounts to the static head (figure 2c.). As a consequence of the expansion the fluid cools down considerably, and the actual head is therefore the height of a column of steam at varying density (and temperature); the pressure at any point of the column is that due to the weight of the steam above it and the density at that point is the density corresponding to such pressure. Such a column of steam with a pressure at its base of 265 lb. per sq. inch and a pressure at the top of $\frac{1}{2}$ lb. per sq inch (measured from zero pressure or an absolute vacuum) would have a height of 365,000 feet. (It should be noted that pressures measured from zero pressure [or an absolute vacuum] are designated absolute pressures. A pressure below atmospheric is expressed either as an absolute pressure or as a vacuum, by which is meant the defect below atmospheric pressure. Thus if the barometer reading is 30″ of mercury then a perfect vacuum would be called a vacuum of 30″ of mercury; and a vacuum of, say, 28″ of mercury is less than a perfect vacuum by the pressure corresponding to 2″ head of mercury.) This therefore is the value of the effective static head of steam when allowed to expand between these pressures.

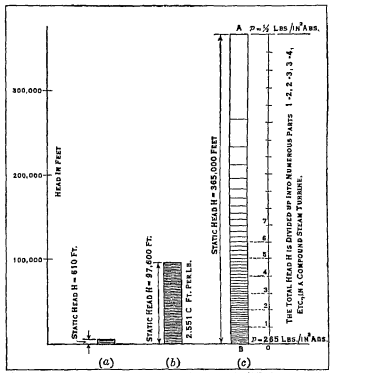

FIG 2.—COMPARISON OF WORKING "HEAD" FOR A WATER TURBINE AND A STEAM TURBINE RESPECTIVELY

Thus the static head h of an expanding fluid can be considered as the height of a column of the fluid at its natural density, that is to say, of a density diminishing from the base upwards just in the same manner as the atmospheric pressure decreases with altitude.

The potential energy gh is then available as before (*i e* , as in the water turbine) for conversion into kinetic energy $\frac{1}{2}V^2$ of the resulting steam jets. The velocity corresponding to a head of 365,000 feet, however, is 4,800 feet per second, and it can easily

be understood therefore that a construction suitable for utilizing the energy of water jets with a speed of 198 feet per second is not suitable for steam in which the available energy per pound corresponds to a jet speed of 4,800 feet per second

Figure (2) is a diagrammatic comparison of the effective static heads above considered, shown as columns of fluid having a pressure of 265 lb. per sq inch at the base. (a) shows the height of such a column of water, (b) that of a fluid at the uniform density which steam has at 265 lb per sq inch pressure, and (c) that for steam at its natural density.

Actually, of course, the head of steam for a steam turbine is not obtained by means of a vertical column, but by generating steam under pressure in a boiler.

This does not alter matters, however, for imagine a steam boiler, generating steam at 265 lb. per sq. inch absolute, to be connected to the base of the column (c) in figure (2) Then evidently the steam will rise up the column, falling gradually in pressure and temperature just as it would do in a turbine, and at an altitude of 365,000 feet it would leave the top of the column as exhaust steam at 4lb /in^2 absolute (assuming the external atmosphere absent) Where has the energy originally in the high pressure steam gone? Clearly it is in the gravitational potential energy of the steam raised to the top of the column In whatever manner the head is generated, the stored energy per pound of fluid is the same. This energy, namely Sum $\frac{P}{\rho}$ has been calculated for steam from an experimental knowledge of its properties, and is tabulated for the use of engineers. It is, however, usual to express it in heat units instead of mechanical units, the two being strictly equivalent (*See* THERMODYNAMICS)

Table I. gives the theoretical values for the velocity attainable by allowing high pressure steam to escape through a suitably shaped orifice or nozzle, to a place at lower pressure

TABLE I.—*Theoretical Velocity of Efflux of a Steam Jet*

Steam pressure lb./in.^{2} abs (dry saturated)	Velocity into atmosphere Ft /sec	Velocity into vacuum of 28″ mercury (baro. 30″) Ft /sec
10		2,677
15		2,900
30	2,602	3,263
50	2,208	3,510
75	2,425	3,671
100	2,645	3,804
125	2,777	3,905
150	2,900	3,983
175	3,000	4,050
200	3,075	4,100
250	3,207	4,190

The Simple Steam "Windmill" of de Laval.—The practical difficulty in utilizing such high velocity steam jets efficiently in a "simple" steam turbine will soon be apparent. Simple mathematical theory shows, and experiment confirms, that the proportion of energy in a jet of steam which can be converted into useful work on the turbine shaft, depends mainly on the relation which is made (by the designer) to exist between the linear velocity U of the "vanes" or "blades," and C_1 that of the jets impinging on them. In other words, the efficiency of a turbine depends mainly on the ratio called the "velocity-ratio," $\frac{U}{C_1}$, usually denoted by the symbol α. Figure 3 shows a curve (A) of the "blading" efficiency obtainable from a "simple" turbine of the type shown in figure (1). Losses due to windage, eddies and friction in the turbine itself, and to friction of bearings, etc., will absorb some of the power developed, so that the "brake" efficiency at the driving end of the shaft will be considerably less.

Here it may be noted that the expression "efficiency of a turbine" must be carefully understood, as it is liable to misinterpretation. If the energy of the steam jet is, say A units of work and out of this the turbine usefully delivers B units to the coupling at the driving end, then the brake efficiency of the turbine is $\left(\frac{B}{A}\right)$. A however, may have very different values, according to the steam conditions The more favourably chosen the steam conditions are, the greater fraction A may be made of the total latent energy E in a lb. of coal or oil fuel. In

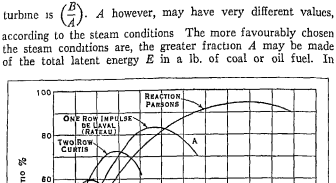

FIG. 3.—CURVES OF EFFICIENCY BLADING

other words, the net efficiency of the whole plant (boilers and turbine) is $\frac{A}{E} \times \frac{B}{A} = \frac{B}{E}$. The important point to be realized is that whilst $\frac{B}{A}$ may be and generally is, in a large modern turbine, about 85%, on the other hand $\frac{A}{E}$ does not even in the very best plants exceed about 36 o% so that the overall efficiency is about (0·36 × 0 85) × 100=30·5% from fuel to brake horse power. This comparatively low figure is not due to imperfections in the plant owing to incorrect design, but to a fundamental law of thermo-dynamics which places a limitation on the thermo-dynamic efficiency of any engine, however perfect, designed to convert the heat of fuel into motive power. For further information upon this aspect of the problem of the utilization of the heat energy in fuel, *see* THERMODYNAMICS

To resume, it will become apparent from fig 3 that the best efficiency for this type of blading is obtained at a "velocity-ratio" of about o 45, that is to say, when the velocity of the blades is about half the velocity of the steam jets. Referring to Table I. it will be observed that with an ordinary boiler pressure of, say, 175 lb /in.^{2} absolute, and a final exhaust pressure of 1 lb /in^2 absolute, the jet velocity is of the order of 4,000 feet per second If the blade velocity is to be o 45 of this, it will be about (o 45 × 4,000)=1,800 ft per sec

The centrifugal forces on a turbine wheel and blades operating at this mean blade velocity will be very great, and the consequent centrifugal stresses also A rim speed of 1,800 feet per sec. would be that of a 10″ wheel revolving at 41,000 revolutions per minute The maximum stress in a disc at this speed would be of an order which is not practicable so that a turbine consisting of a single wheel can only have o poor velocity ratio, and is only suitable for small outputs for which efficiency is of secondary importance. The speed of revolution is necessarily high, and such turbines have therefore to be coupled to the machines they drive through some form of speed-reducing gear, usually of the mechanical type, with double helical gear wheel teeth

The "simple" type of steam turbine or steam "windmill" was first perfected by the great Swedish Engineer Gustav C P. de Laval in 1887 after several years of preliminary work. It ranks as a great achievement inasmuch as, within the limitations just described, it is a perfectly practical solution of the problem, worked out moreover in days when reliable data on the proper-

ties of steam were practically non-existent

Velocity Compounding of Steam Turbines.—If the mean blade speed of a simple steam "windmill" such as the de Laval, is less than about half the circumferential velocity of the steam jets, the latter will not be slowed down sufficiently in the space following the moving blades, and some of their energy will be wasted. In other words, the velocity of the steam will not be a minimum. In order to provide means for recovering the energy in the residual velocity, about the year 1898, Curtis developed in the United States of America a system known as "velocity compounding" In this arrangement he fitted additional guide blades to re-direct the steam on to further rows of moving blades Figure 4 illustrates a series of such additional rows. The characteristic feature is that the fall in steam pressure is confined to the nozzles, the steam flowing through the remaining blades at constant pressure, but with ever diminishing velocity, because of the energy absorbed by the wheel and transmitted to the turbine coupling It might be supposed these rows could be made sufficiently numerous to extract the whole energy economically in a single pressure stage, *i.e.*, that pressure compounding would be unnecessary. Unfortunately, however, reversal of the direction of the motion of steam at high velocity is accompanied by loss of energy and this, together with frictional losses, soon imposes a limit to the number of reversals which can be efficiently employed The "two-row" Curtis wheel has been employed widely but the 3-row Curtis wheel is so inefficient that it is now seldom used except in small auxiliary turbines or sometimes in marine astern turbines where efficiency is less important.

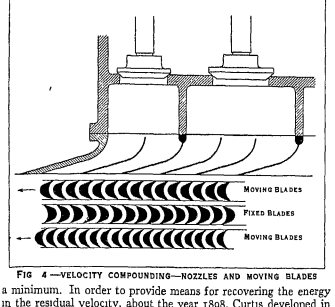

FIG 4.—VELOCITY COMPOUNDING—NOZZLES AND MOVING BLADES

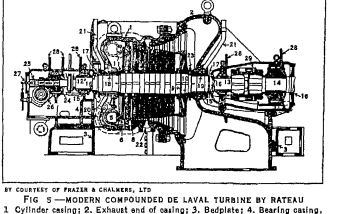

Parsons' Master Principle of "Pressure Compounding."—The application of steam turbines on these lines could never, owing to the limitations described above, become general, and the master invention which has opened up an unlimited field of utility was supplied in 1884 by Sir Charles A. Parsons

The high efficiency already attained by water turbines (*q.v.*) operating under very moderate "heads" of water, made it seem to him possible that if a number of "simple" one wheel steam turbines were placed in series on the same shaft, one turbine exhausting its steam into another, and so on, it would be practicable to divide up the energy of expansion of the steam over a number of such "elementary" turbines so that the effective "head" of steam (in other words, the amount of expansion) in each would be small.

Thus, since the velocity of efflux of the steam jets in each "simple" turbine of the series would be correspondingly reduced, the latter would operate under conditions more analogous to the water turbine, that is with moderate and practical blade speeds, in conjunction with high "velocity-ratio" and high efficiency

This fundamental concept was subjected to practical test by Parsons in a turbine of his own design at Gateshead-on-Tyne, England, in 1884, and has since proved to be the only solution. In fact, this principle of "pressure-compounding" or using several "simple" turbines in series is an essential feature of *all* modern steam turbines of large output and high economy, because it permits reasonable blade velocities to be adopted, without sacrifice of efficiency (Parsons' original 10 h p steam turbine and dynamo may be seen in the Science Museum, South Kensington, London.)

Application of Parsons' Principle.—The application of this principle may best be grasped by considering its application (at a later date) to the simple turbine of de Laval Figure 5 gives a diagram of a modern turbine of this kind, associated chiefly with the name of Rateau, who developed it from about the year 1896 The turbine consists of a series of de Laval wheels or steam "windmills" all mounted on the same shaft, each wheel being placed in a compartment. High pressure steam is admitted to the first wheel of the series through suitable nozzles. (Figure 6) In the partition dividing the first wheel from the second wheel there is a second set of nozzles so proportioned as to maintain a suitable back pressure in No 1 compartment and not allow the steam to escape from it too freely By thus limiting the drop of pressure from boiler pressure to that in the first compartment, the steam velocity generated in the first set of nozzles can be adjusted to any desired value and consequently also the resulting jet velocity

The passages which form the exhaust or exit ports from the first wheel are actually nozzles delivering the steam in the form of jets on the second wheel of the series In the succeeding wheels the same procedure is followed over and over again, the initial steam pressure being thus reduced by appropriate steps until finally the exhaust at exit pressure is reached in the last wheel. From a correct knowledge of the properties of steam and of the losses which occur due to friction and eddies, it is possible to choose the proportions of the nozzles so that every wheel of the series operates at a proper velocity-ratio.

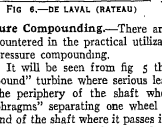

FIG 6.—DE LAVAL (RATEAU)

Difficulties Attending Pressure Compounding.—There are certain unavoidable losses encountered in the practical utilization of the Parsons principle of pressure compounding.

It will be seen from fig 5 that there are places in a "compound" turbine where serious leakage can take place, viz. round the periphery of the shaft where it passes through the "diaphragms" separating one wheel from another, and also at each end of the shaft where it passes into the outer atmosphere

The necessary surface speeds in successful steam turbines are so high that generally speaking leakage cannot be entirely stanched

by any form of packing which involves actual rubbing contact, on account of the great frictional heat that would be generated. It follows therefore, that such leakage, if it cannot be altogether suppressed, must be reduced to a minimum by the use of fine working clearances. Thus all compound turbines, of whatever design, have fine clearances in certain parts, such fine clearances being essential to steam economy

The early pioneer work of Sir Charles Parsons was carried out against considerable obstacles For 13 years after 1884, no notice whatever of his efforts was taken on the continent of Europe

In dealing with the problem of the reduction of steam leakage, Parsons originated two principles, namely, that where the relative motion between two surfaces is very great and it is desired to limit the fluid or gaseous leakage between them as between the rotating shaft and the fixed casing,

(1) One of the surfaces should be provided with thin edges or so-called "contacts";

(2) Both surfaces must be serrated, *i.e.*, given an interrupted contour in the direction of the pressure gradient.

The first is necessary in order to make it possible to limit the leakage area through which steam can escape, that is to say, to enable the two surfaces to be run close up to one another at suitable points, without danger of irreparable damage, in the event of accidental contact.

The second is necessary in order to limit further the leakage by compelling the steam to flow in a tortuous path.

In another well-known form of packing, which is said to have been originated much later in Germany, rings of graphite or carbon are placed round the shaft Each ring is cut up into several segments, and all are held together by a "garter" spring. A pin projects into the fixed turbine casing on one side in order to prevent the carbon ring being carried round with the rotating shaft. The carbon ring does not actually seal the shaft against all leakage; if it pressed sufficiently hard on the shaft to do so it would rapidly become overheated, as explained above. In practice, the length of the individual segments is made such that when they are pressed together butt and butt by the garter spring they are just clear of the shaft, and a thin film of leakage steam separates them from actual contact.

Parsons' Compound Reaction Steam Turbine.—Although Parsons' master principle of pressure compounding has since its introduction been applied to all types of modern efficient turbines, there is another distinctive feature of design which he introduced in 1884 and which renders his steam turbine different from all others, with the one exception of the Ljungstrom (1912) This feature (*see* fig 7) is the use of blades which give a nozzle shape to the spaces between them in both the fixed and rotating elements of the turbine (fig 8) In the modern "reaction" turbine, in fact, the efficiency of the "blading" is practically equal to that of well-formed nozzles It has therefore a higher intrinsic efficiency than "impulse" blading, because in the latter there are losses due to friction in the moving blades in addition to the losses in the nozzles.

As will be made evident later, in a Parsons reaction turbine, the function of the fixed nozzles is to bring the steam jets smoothly into the moving nozzles and the turbine is driven or rotated almost entirely by the reaction of the steam jets issuing from the moving nozzles Hence the name "reaction turbine." This reaction is analogous to that of machine guns. The moving blades themselves in a reaction turbine represent the guns which receive a continuous backward "kick" or "reaction" from the shots fired from them, causing them to recoil in the opposite direction

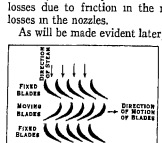

FIG. 8.—DIAGRAM SHOWING REACTION BLADING

Features of Reaction Blading.—A further source of leakage occurs in the reaction turbine from the fact that the rotating blades are themselves nozzles, so that there is a drop of pressure in them just as occurs in the fixed nozzles or "guides" Steam will therefore tend to leak past the clearances of each To minimize this, many makers prefer to use the Parsons practice of 1906, in which the tips of the blades are thinned down almost to a fine edge, so that fine radial clearances can be used without risk of serious damage in case of accidental contact (*see* figs. 9, 10)

The most modern form of Parsons reaction blading however is shown in fig 10. This is known as "end-tightened" or axial-clearance reaction blading. It will be seen that the clearance in the radial direction is large, giving mechanical safety. The blades are fitted with shrouding having an overhanging sharp edge in close proximity to the roots of the blades of the adjacent row. The axial clearances between the edge of the shrouding and the blade-roots are adjustable by endwise motion of the rotor, and because of the positive nature of the control of the end-position of the "rotor" by the thrust block, the axial clearances can be made small with greater safety

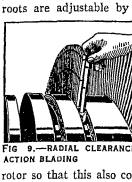

FIG 9.—RADIAL CLEARANCE—REACTION BLADING

Another feature of reaction blading, due to the pressure drop over the moving blades, is the evident existence of an unbalanced steam thrust on every row of the latter. There is also a steam pressure gradient along the rotor so that this also contributes to a resultant steam thrust on the rotor and its blading of considerable magnitude in a direction down the turbine, *i.e.*, towards the exhaust end This resultant thrust may amount to several tons and may be too heavy to carry entirely on the thrust bearing. Parsons therefore uses dummy pistons to balance the end thrust by receiving steam pressure in the opposite direction. One such piston could be made to balance the whole, but in order to ensure proper control of the end pressure at all loads and under all conditions it is usual to use two or more dummy pistons, each connected to that portion of the rotor blading which it balances, by means of large bore equalizing pipes. Sometimes the low pressure dummy piston is omitted and the residual end thrust carried by the thrust bearing. This practice saves the steam leakage past the low pressure piston and thus improves the economy.

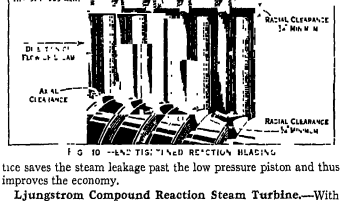

FIG 10.—END TIGHTENED REACTION BLADING

Ljungstrom Compound Reaction Steam Turbine.—With few exceptions, modern turbines are built as axial-flow turbines with horizontal shafts. In the Ljungstrom turbine, a constructional peculiarity is that the steam is made to flow radially outwards. In addition, instead of having alternate rows of fixed and moving blades, the guide nozzles are themselves allowed to rotate, but in the opposite direction, so that it is the same in effect as if the casing of a Parsons turbine were allowed to revolve in a direction opposite to that of the shaft or rotor. The blades are attached in concentric rings to two discs, mounted on shafts with a common horizontal axis, revolving in opposite directions, and driving separate dynamos.

Differences Between Impulse and Reaction Turbines.—The names "impulse" and "reaction" turbines mentioned above, are more popular than scientific, and it is important to possess a clear idea of the fundamental constructional difference in design which places a turbine in one or other category.

A comparison of the longitudinal section of a modern axial-flow horizontal impulse turbine (fig. 5) with that of a similar modern reaction turbine (fig. 7) shows that speaking generally the former is characterized by the presence of definite compartments or cells in which each row of blades revolves, while in the latter the compartments are virtually non-existent. This difference, however, is a matter of expediency for the particular type of blading adopted, and is not a matter of fundamental design There is no theoretical reason why impulse blading should not be arranged on a barrel like the reaction blading in fig. 7, or why reaction blading should not be arranged with diaphragms and wheels like the impulse blading in fig. 5. This is an important point to be borne in mind

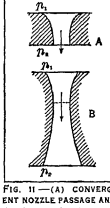

FIG. 11.—(A) CONVERGENT NOZZLE PASSAGE AND (B) WITH DIVERGENT OR TRUMPET-SHAPED MOUTHPIECE ADDED

It is not enough merely to say: "this turbine has nozzles in diaphragms followed by a row of buckets, therefore it is an impulse turbine," and "that turbine has no diaphragms but has nozzles in both fixed and moving elements, therefore it is a reaction turbine." The further question arises. "What are the essential characteristics of nozzles, and in what way do buckets or vanes or blades differ from them?"

The fundamental constructional difference lies in the shape of the steam passages or paths between the blades or vanes which are used. The nozzles used in steam turbines to produce the propelling steam jets are always the same in principle, although they may differ considerably in their proportions. There is, that is to say, always a narrowing or "convergent" passage connecting a region of higher steam pressure with a region of lower steam pressure, the change in cross section of the passage (fig. 11a) being made gradual in order to obtain high efficiency of conversion of pressure-energy into kinetic or velocity energy.

The nozzle may have a divergent extension or "mouthpiece" as in fig. 11b and in turbine design has to be "skewed" at an angle to the plane of the wheel, as in figs. 12a and 12b, but in every case the primary intent is to create a drop in pressure over the two sides of the boundary plate containing the nozzles, and to utilize that pressure drop to produce a steam jet. Having obtained the requisite steam jets, however, the buckets or blades on the rotating wheels are made with the fundamental distinction corresponding to "impulse" or "reaction" design respectively. If the blade-passages of the rotating wheels are "parallel" or nearly parallel (*i.e.*, non-convergent) as in fig. 13 the blading is of the "impulse" type, *i.e.*, nozzles followed by buckets. If they are passages of diminishing cross-sectional area (*i.e.*, convergent) the blading is of the "reaction" type, fig. 8.

Velocity Diagrams.—As a further aid to an understanding of these fundamental differences, study may be made of a useful graphic representation of the velocity and trajectory of the steam jets in their passage through the nozzles and blades.

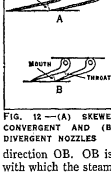

FIG. 12.—(A) SKEWED CONVERGENT AND (B) DIVERGENT NOZZLES

Figure 14a is what is known as a "velocity diagram" for impulse blading, in which "U," the mean circumferential velocity with which the blades are moving in front of the nozzles, is represented by BA. OA is the velocity "C," of the steam jet issuing from the nozzles. It will be seen that the blades are running away from the steam jets, so that if it were possible for an observer to be stationed at B (*i.e.*, going round with the blades) he would see the steam jets apparently coming in the direction OB. OB is, in fact, the relative velocity of approach with which the steam impinges on the blades, and the blade inlet angle at B would be made suitable to receive the steam approaching the blades in this direction.

Passing over the blade-surfaces, the steam jets are deflected out of their paths OA, and shoot off the tails of the blades with velocity CD relative to the blades, which, if frictional losses are neglected, is equal to the relative velocity of entry OB. But as the blades are themselves moving with velocity "U" or ED, the actual path taken by the steam jets at exit, relative to the fixed turbine

casing, will be CE

It was mentioned previously that the best velocity-ratio for this type of blading is about 0·45, in other words the steam-jet velocity OA must be rather more than twice the mean blade-velocity BA. When this is the case, as will be seen from the diagram the steam finally leaves the wheel with axial velocity CE, which is evidently the minimum, for if it left in the direction C'E' (fig 14b), it would evidently be greater When CE is a minimum it is evident that the maximum energy has been extracted from the steam jets, and this occurs when $\frac{U}{C_1}$ is slightly less than one-half.

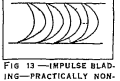

FIG 13.—IMPULSE BLADING—PRACTICALLY NON-CONVERGENT

In Parsons' reaction blading, on the other hand, the best velocity ratio is about unity, that is to say, the mean blade-speed has to be nearly equal to the velocity of the steam jets Thus OA (fig 15a) represents the steam velocity Circumferentially, this is equal to BA, the velocity with which the blades are running away from the steam-jets. To an observer at B therefore (moving round with the blades), the steam jets would appear to approach along OB, which is parallel to the axis of the turbine Now this apparent or relative velocity of approach OB of the steam jets is quite small and further, being axial in direction, exerts no driving force on the moving blades Hence the statement made that the function of the fixed nozzles is to bring the steam into the moving nozzles smoothly and without shock Figure 15b shows the diagram when the velocity-ratio is too low

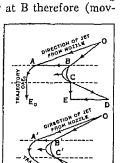

FIG. 14.—VELOCITY DIAGRAMS FOR DE LAVAL OR RATEAU BLADING
(A) Correct velocity
(B) Underspeeded

With either type of blading ("impulse" or "reaction") the ideal condition for theoretical maximum efficiency is reached when the steam leaves the moving blades with a relative circumferential velocity ED equal to the mean blade-speed BA, so that in relation to the turbine casing itself the actual velocity is a minimum, and the maximum energy has been extracted from the steam jets.

Combined Types of Turbines.—The velocity-compounded wheel of Curtis is frequently used for the first pressure stage of a turbine of which the succeeding stages are either of the compound impulse or of the compound reaction type A two row Curtis wheel displaces three or four de Laval wheels in series, or alternatively seven or eight pairs of nozzle rings of the Parsons reaction type. Although it has an inherently lower efficiency than single-row de Laval wheels or than reaction blading, its use has been justified by some designers on the grounds that at the high-pressure end of a turbine the efficiency of the latter is considerably reduced by steam leakages or windage losses, or both so that the net efficiency of the two-row Curtis is not much inferior.

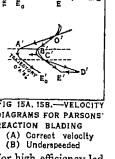

FIG 15A, 15B.—VELOCITY DIAGRAMS FOR PARSONS' REACTION BLADING
(A) Correct velocity
(B) Underspeeded

Recently, however, in land turbines there has been a return to the use of the Parsons principle alone, the whole turbine, that is to say, being built up of simple pressure stages only (either of the de Laval or of the Parsons type), without any velocity-compounding.

The large number of such stages required for high efficiency led Parsons as long ago as 1899 to divide up the casing into two separate "cylinders" or separate turbines, coupled together in line and driving the same dynamo. Parsons used three separate cylinders in series on the steam-flow for the triple-shaft steam yacht "Turbinia" in 1897 (to be seen in the Science Museum, South Kensington, London).

In modern land practice for the generation of electricity on a large scale in central power-stations, the two-, or even three-cylinder turbine is widely used and in some continental examples even four separate cylinders have recently been adopted as a means of securing the highest efficiency, having regard to the ever increasing initial steam pressures and temperatures that are now being favoured

Present Position of the Steam Turbine.—Essentially a high-speed prime-mover, the steam turbine in the early days of its development was unsuited to drive machinery which must run at a moderate or low speed of revolution Such machinery might be grouped under the following headings —

(1) Direct current dynamos.
(2) Paper mills, Jute mills, Textile mills.
(3) Screw propellers for marine propulsion.

The development by Parsons in 1910 of the small double-helical speed-reducing gears of de Laval, so as to be suitable for transmitting large powers, has permitted complete freedom of choice with regard to speeds, so that the steam turbine can now be applied to the driving of anything in which continuous rotary motion is required The design of the earlier marine installations was largely a matter of compromise between the high speed of revolution required for the turbine and the much lower speed which was more suitable for the propeller Since the introduction of mechanical gearing, the marine turbine has tended to become assimilated in type to the land turbine, the same conditions for high thermal efficiency, namely, high velocity ratios, high steam pressures and temperatures, and lowest possible exhaust steam pressures being equally applicable

TURBINE: WATER. Modern hydraulic turbines may be divided into two classes, impulse, and pressure or reaction turbines. Of the former the Pelton wheel, and of the latter the Francis turbine or one of its modifications, are the only types used in recent important installations.

In an impulse turbine, the whole head of the supply water is converted into kinetic energy before the wheel is reached. The water is supplied to the wheel through a nozzle which delivers a high velocity jet at atmospheric pressure on to the vanes or buckets mounted on the periphery of the wheel.

In the pressure or reaction turbine, the wheel or runner is provided with vanes into which water is directed by a series of guide vanes extending around the whole periphery. The water on leaving these guide vanes is under pressure, and supplies energy partly in the kinetic and partly in the pressure form. In its passage through the runner the pressure energy is utilized in increasing the relative velocity of flow between the vanes, and the water finally leaves the runner at the pressure obtaining in the discharge pipe or draft tube

In the earliest of these turbines, the Fourneyron, the guide vanes were inside the runner, and the water flowed outward This was followed by the Jonval turbine, in which the guide vanes are

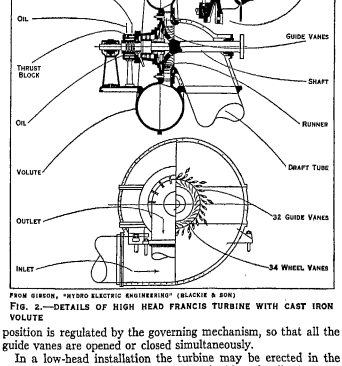
above the runner and the water flows axially into and through the wheel. Both types are now obsolete, and one or other modification of the Francis or inward-flow turbine, in which the guide vanes surround the outer periphery of the runner, is now in general use.



The supply of water to the runner depends upon the opening

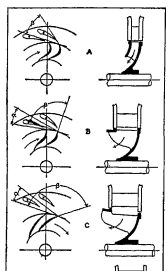
FIG 1.—PLAN AND ELEVATION OF LOW HEAD FRANCIS TURBINE AND SETTING, VERTICAL SHAFT MACHINE WITH ELECTRIC GENERATOR ABOVE TAIL RACE LEVEL

between the guide vanes. These are pivoted on stems which project through stuffing boxes in the turbine casing Each stem carries a lever. These are all coupled to a regulating ring whose



FROM GIBSON, "HYDRO ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 2.—DETAILS OF HIGH HEAD FRANCIS TURBINE WITH CAST IRON VOLUTE

position is regulated by the governing mechanism, so that all the guide vanes are opened or closed simultaneously.

In a low-head installation the turbine may be erected in the open forebay or supply canal. This method has the disadvantage that the guide-vane mechanism is submerged and cannot be inspected or repaired without draining the wheel pit, and in most recent installations, even of the low-head type, the guide-vane ring is surrounded by a spiral volute chamber, from which the pressure water is delivered with uniform velocity around the entire periphery of the guide ring. For heads not exceeding about 100 ft., modern practice favours the moulding of the volute chamber in the concrete of the substructure (fig 1). For higher heads, considerations of strength necessitate a metal casing, to which the water is supplied through a pressure pipe line (fig 2) The turbine runner is usually of cast iron, although where corrosion or erosion is to be anticipated, it may be made of cast steel if large, and of phosphor bronze if small.

FROM GIBSON, "HYDRO ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG 3.—TYPES OF TURBINE RUNNER

A. For high heads and comparatively low speeds. B. For medium heads and moderate speeds. C. For medium heads and high speeds. D. For low heads and high speeds

The general changes in the shape and proportions of the runner which have accompanied recent development of the low head high-speed turbine are indicated in fig. 3. The change has been generally in the direction of increasing the axial depth of the buckets, and at the same time of maintaining or increasing the ratio of the discharge area at exit to that at entrance At the same time the width of the buckets in the direction of flow has been reduced An extreme example is shown in fig 3D, in which flow through the wheel itself is almost axial. In many recent low-head turbines the runners are of the propeller type. They are characterized by the fewness of the vanes, as few as three or four in many cases, and are in appearance very like the ordinary ship's propeller.

The Draft Tube.—In order to avoid the flooding of the turbine house by any raising of the tail race level in time of floods it is usually necessary to instal the turbines at some higher elevation, and if the turbines were provided with open discharge pipes, freely discharging into the atmosphere, the proportion of head represented by the elevation above tail water level would be lost By arranging the discharge, or draft tube, so that the outlet is always submerged, it becomes possible, however, to place the turbine above tail water level without loss of head The pressure at the point of discharge from the runner into the draft tube is now less than atmospheric by an amount which depends upon the elevation above tail water level.

The draft tube also, if well designed, serves a further purpose in that it enables a large proportion of the kinetic energy of discharge from the runner to be converted into pressure head, and so to be utilized. For this the tube must be designed with a gradually increasing diameter, so that the velocity is gradually reduced from v_1 to v_2 before discharge (fig 4). The velocity of discharge from the draft tube should not exceed about 4 f s

Hydraulics of the Reaction Turbine.—In the following discussion let ω = angular velocity of the runner in radians per second ($\omega = 2\pi N \div 60$ where N = revolutions per minute); $u = \omega v$ = velocity of wheel at point indicated by a suffix; v = absolute velocity of water; w = tangential component of v; f = radial component of v; v = relative velocity of water and vane; α = guide vane angle, β = wheel vane angle at entrance; γ = wheel vane angle at exit; Q = flow in c.f.s.; W = weight of 1 cu.ft. of water; suffix (2) refer to inlet to wheel vanes; suffix (3) refer to exit from wheel vanes

For entry without shock, the direction of the relative velocity

of water and vane at the entrance to the wheel must be parallel to the vane tips, and a consideration of the diagram of velocities (fig. 4) shows that if the angles are correctly proportioned:

$$f_2 = w_2 \tan\alpha = (w_2 - u_2)\tan\beta, \quad \therefore\ u_2 = w_2\left(1 - \frac{\tan\alpha}{\tan\beta}\right).$$

$$f_3 = (u_3 - w_3)\tan\gamma; \quad 3v_r = f_2 \operatorname{cosec}\beta,\ 3v_r = f_3 \operatorname{cosec}\gamma$$

The change of the moment of momentum in the wheel = turning moment $= \frac{WQ}{g}(w_2 r_2 - w_3 r_3)$ ft. lb.

$\therefore$ Work done per second on runner $= \frac{WQ}{g}(w_2 u_2 - w_3 u_3)$ ft. lb.

In an ideal wheel, with no friction or eddy losses, neglecting changes of level in the wheel, we should have

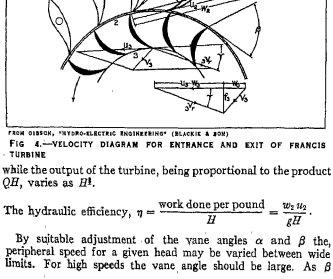
$$\frac{p_2}{W} + \frac{v_2^2}{2g} = \frac{p_3}{W} + \frac{v_3^2}{2g} + \text{work done per pound between (2) and (3)}$$

The efficiency will be a maximum when the energy rejected in the discharge is a minimum, *i.e.*, when v_3 is a minimum, or when w_3 is zero, in which case $v_3 = f_3$. Assuming the wheel to be designed for this state of affairs,

$$\frac{p_2}{W} + \frac{v_2^2}{2g} = \frac{p_3}{W} + \frac{f_3^2}{2g} + \frac{w_2 u_2}{g}.$$

Writing H as the head available to produce flow through the wheel, so that

$$H = \frac{p_2}{W} + \frac{v_2^2}{2g} - \frac{p_3}{W}, \text{ we have } H = \frac{f_3^2}{2g} + \frac{w_2 u_2}{g},$$



from which, writing $f_3 = f_2 \frac{b_2 r_2}{b_3 r_3} = w_2 \tan\alpha \frac{b_2 r_2}{b_3 r_3}$,

where b and r are the breadth and radius of the wheel, we get, on substitution,

$$w_2 = \sqrt{\left[\frac{2gH}{2 + \left(\frac{b_2 r_2}{b_3 r_3}\tan\alpha\right)^2 - 2\frac{\tan\alpha}{\tan\beta}}\right]}$$

while $u_2 = w_2\left(1 - \frac{\tan\alpha}{\tan\beta}\right)$, and $Q = A_2 v_2 = A_2 w_2 \tan\alpha$.

Thus in a wheel of given design, the peripheral speed for maximum efficiency, and the volume of discharge, each vary as $\sqrt{H}$,

FROM GIBSON, "HYDRO-ELECTRIC ENGINEERING" (BLACKIE & SON)

FIG. 4.—VELOCITY DIAGRAM FOR ENTRANCE AND EXIT OF FRANCIS TURBINE

while the output of the turbine, being proportional to the product QH, varies as $H^{\frac{3}{2}}$.

The hydraulic efficiency, $\eta = \frac{\text{work done per pound}}{H} = \frac{w_2 u_2}{gH}$.

By suitable adjustment of the vane angles α and β the, peripheral speed for a given head may be varied between wide limits. For high speeds the vane angle should be large. As β is increased the value of f_2 and hence the volume of water passing a wheel of given size diminishes, so that to obtain the same output the size of the wheel must be increased If, as is usually the case in low-head plants, a high rotative speed is required, the inlet area is increased by increasing the depth of the runner. Such a turbine has a comparatively large ratio of inlet area to discharge area, and the velocities of discharge are relatively high For high heads β may be between 60° and 90°, and, for medium and low heads, between 90° and 135°. Similarly, while the hydraulic efficiency decreases as α increases, the volume of flow increases with α, and the maximum output is obtained when the product of Q and η is a maximum For high efficiency α should be as small as mechanical considerations permit, generally between 12° and 18°.

In one modern turbine, the Kaplan, the wheel vanes are not fixed but are pivoted on a central drum, and their leading angle β can be adjusted while running so as to suit any variations in the working head or discharge In this way a very high efficiency may be maintained at all loads

Specific Speed of a Turbine.—In order to afford a basis of comparison of turbines of different diameters and proportions operating under different heads, the term known as "specific speed" has been introduced. This may be defined as the speed at which a runner would operate if reduced geometrically to such a size that it would develop 1 h.p. under unit working head The figures for specific speed given below refer to a unit head of 1 foot If the metre be adopted as the unit, these figures require to be multiplied by 4·45.

If N be the number of revolutions per minute,
" P " " horsepower of the turbine,
" H " " working head in feet,

the specific speed $N_s = \frac{N\sqrt{P}}{H^{\frac{5}{4}}}$ revs. per minute.

The specific speed of a reaction turbine may be varied by varying the diameter of the runner, the angle of the gude vanes and the angle of the wheel vanes. By modifying the design as indicated in the sketches of fig 3 it is possible, while maintaining high efficiencies at full load, to increase the specific speed from about 15, its minimum value with the type shown in fig 3A, to about 125 with the type shown in fig. 3D Specific speeds as high as 150 are possible with some sacrifice in efficiency, and it is probable that further developments will see the value increased still farther These high specific speeds are extremely valuable for low-head installations since they enable the size and cost of the turbine and of the generator to be greatly reduced In fact, many existing low-head installations would have been commercially impracticable but for the development during recent years of the high-speed turbine.

High specific speeds are, however, attended by some disadvantages The part-gate efficiency in general falls off as the specific speed increases. Also if the speed is unduly high it becomes very difficult to avoid very high local velocities and centres of low pressure in the runner, which invariably give rise to severe corrosion At the present stage of design, the maximum specific speeds to be used under normal circumstances with various heads are approximately as follows:

Head (feet)	20	40	60	80	100	150	200	300	400	600
Specific speed r.p.m.	125	100	85	75	65	50	43	33	30	25

The reaction turbine may be built either as a horizontal or vertical shaft machine. The latter type, having the weight of the rotating parts supported by a thrust bearing of the Michell or Kingsbury type, has been gaining in popularity of recent years.

The Pelton Wheel.—This is usually built as a horizontal shaft machine and consists of a runner carrying a series of buckets around its periphery on which impinge one—or in exceptional cases two—high velocity jets from a nozzle or nozzles at the end of the supply pipe line (fig 5). The buckets are spoon shaped and have a central sharp ridge which divides the impinging jet into

two halves which are deflected backwards by the buckets through about 165°. The modern Pelton wheel is always fitted with a circular nozzle, with an axial needle or spear for regulating the size of the jet. The maximum diameter of jet as yet adopted is about 12 inches. The axial position of the needle in the nozzle is regulated by the governing mechanism in all important installations.

The Pelton wheel, being essentially a high head turbine, is usually supplied through a comparatively long pipe line, and any

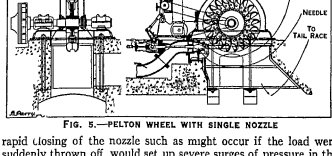


FIG. 5.—PELTON WHEEL WITH SINGLE NOZZLE

rapid closing of the nozzle such as might occur if the load were suddenly thrown off, would set up severe surges of pressure in the pipe line which would not only prevent close speed regulation but might be dangerous. To prevent this, modern Pelton wheels are also fitted with a jet deflector, consisting of a curved plate pivoted between the nozzle and the buckets, which is operated by the governor and which when in action cuts into the jet and deflects it either wholly or partially into the tail race. The governing mechanism is so arranged that when load is thrown off the wheel, the deflector at once comes into play, deflecting the jet from the buckets. The needle then begins to move slowly towards the closed position, and at the same time the deflector moves slowly back towards its idle position. Ultimately both come to rest with the deflector just clear of the jet, and with the diameter of the latter so adjusted as to give the required supply of water to the wheel.

Hydraulics of the Pelton Wheel.—If H be the pressure head behind the nozzle, in feet, the velocity of efflux is $C_v\sqrt{2gH}$ ft. per second, where C_v, the coefficient of velocity, in a well-formed needle nozzle is approximately ·99. Calling this velocity V_1, the horsepower of the jet is equal to

$$\frac{62{\cdot}4aV_1^3}{550\times 2g}$$

where a is the area of the jet in square feet.

Let u = peripheral speed of buckets at pitch circle, in ft. per second.
" V_2 = final absolute velocity of water leaving the buckets.
" $_1v_r$ = relative velocity of jet and bucket at entrance.
" $_2v_r$ = relative velocity of jet and bucket at discharge.
" α = mean angle between jet and tangent at point of contact.
" γ = total angle of deflection of buckets.

Then the initial velocity of jet in direction of tangent at point of impact $\Big\}$ $= V_1\cos\alpha$.

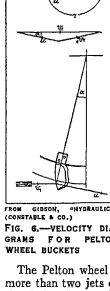
The component, parallel to the tangent at discharge, of final velocity relative to bucket $\Big\}$ $= {}_2v_r\cos\gamma$.

$\therefore$ Absolute velocity in this direction at discharge $= u + {}_2v_r\cos\gamma$.

$\therefore$ Change of tangential momentum per second per pound

$$= \frac{1}{g}(V_1\cos\alpha - u - {}_2v_r\cos\gamma).$$

$\therefore$ Work done per pound of water per second



$$= \frac{u}{g}(V_1\cos\alpha - u - {}_2v_r\cos\gamma) \text{ ft. lb.}$$

$\therefore$ Efficiency $= \dfrac{u}{gH}(V_1\cos\alpha - u - {}_2v_r\cos\gamma)$.

The loss due to friction and eddies in the buckets $= \dfrac{{}_2v_r^2 - {}_2v_1^2}{2g}$ ft. lb. per pound, where ${}_2v_r^2 = V_1^2 + u^2 - 2V_1u\cos\alpha$.

The loss due to rejection of kinetic energy in the discharge $= \dfrac{V_2^2}{2g}$ ft. lb. per pound, where $V_2^2 = u^2 + {}_2v_r^2 + 2u{}_2v_r\cos\gamma$.

Tests show that in an average wheel ${}_2v_r$ may be as low as from ·5 to 6 ${}_1v_r$. In a well-designed bucket, however, having a ratio of bucket width to jet diameter not less than about 3·3, this ratio approximates to ·75 or even ·8. If the angle of deflection were 180°, and if the buckets were frictionless, the value of the peripheral speed of the wheel for maximum efficiency would be $V_1\cos\alpha \div 2$, or approximately $V_1 \div 2$, since α is small. When account is taken of the various losses and of the fact that γ is less than 180°, the best peripheral speed lies between ·44 and ·48 V_1.

FROM GIBSON, "HYDRAULICS" (CONSTABLE & CO.)

FIG. 6.—VELOCITY DIAGRAMS FOR PELTON WHEEL BUCKETS

Comparison of Impulse and Reaction Turbines.—The peripheral velocity of a Pelton wheel for maximum efficiency is slightly less than one-half the velocity of the jet (usually approximately $\cdot 46\sqrt{2gH}$, where H is the head), while that of the reaction turbine varies from about $\cdot 65\sqrt{2gH}$ to $1{\cdot}05\sqrt{2gH}$, depending on the design. Because of this, the Pelton wheel is well adapted for very high heads, which may then be utilized with moderate speeds of rotation. On the other hand the relatively high speed of the reaction turbine enables reasonably high rotative speeds to be obtained with low heads.

The Pelton wheel cannot well be designed to utilize efficiently more than two jets on a single wheel, and as the maximum practicable jet diameter is not large, the volume of water which can be handled and the output of the turbine become small under low heads. The reaction turbine with its full peripheral admission on the other hand is well adapted for large volumes. It is not suited for small powers under high heads, since the volume of water is then small, the waterways are of very small sectional area and easily become choked by floating debris, and the fluid friction losses become relatively high.

The Pelton wheel cannot easily be adapted to the use of a suction or draft tube, and, where the tail-race level may vary appreciably, must be installed above the highest probable tail-water level with some sacrifice of head. The efficiency of the reaction turbine is not so sensitive to changes of head as that of the Pelton wheel, but if operated under constant head and at constant speed, the efficiency of the Pelton wheel does not fall off so rapidly at part loads as that of the reaction turbine. On the other hand, the modern reaction turbine has a slightly higher full-load efficiency, so that the average efficiency from half to full load is sensibly the same in a well-designed machine of either type. The following table shows typical values of the part-load efficiencies of modern turbines of both types of large size, installed under equally favourable conditions.

Proportion of maximum discharge	·2	·3	4	·5	·6	·7	8	9	1·0
Efficiency of reaction turbine	·60	·70	·75	·79	82	·87	90	91	·89
Efficiency of Pelton wheel	·70	·78	·82	83	·84	·85	·86	·85	·83

The possibilities of accurate speed regulation are about equal in the two types.

For large units the reaction turbine is generally preferable for heads up to 400 feet. For heads above 750 ft. the Pelton wheel is more suitable, while between these limits the choice depends largely upon local circumstances and on the power required. The greater simplicity and accessibility of the parts requiring replacement due to natural wear and tear renders the Pelton wheel more

suitable when the supply is taken from a stream carrying an appreciable amount of grit

The reaction turbine has been built in units capable of developing 65,000 H P. The most powerful Pelton wheel yet constructed develops about 30,000 H P., but these outputs could be largely extended if necessary.

TURBOT (*Rhombus maximus*), a flat fish of the Mediterranean and the Atlantic coast of Europe, is distinguished by a large terminal mouth, eyes on the left side, a very deep body and a naked skin, with conical bony tubercles scattered on the eyed side. The brill, a related species, is not so deep and is scaly The turbot is a valued food-fish; it feeds mainly on other fishes; it attains a weight of 30 lb. It has a longer larval life than most flat fishes; and specimens nearly an inch in length, with an eye on each side, may be found swimming at the surface.

TURBULENCE, ATMOSPHERIC. *Turbulence*, in sciences relating to fluids, means unsteady and irregular motion It contrasts with still conditions and steady motion and with wave motion. The last is unsteady but regular and periodic. Turbulence is very common in the lower atmosphere, being visible in the irregular shapes assumed by smoke from the stack of a ship or factory, in the fluctuating paths of falling snow and in the forms assumed by tobacco smoke.

Atmospheric turbulence is directly felt in the variable pressure and cooling effect of the wind. The variations consist of *gusts*, which are periods of wind speed above average, and *lulls*, which are periods of wind speed below average The more noticeable gusts and lulls last one second or more each. These changes in wind speed are always accompanied by changes in direction as well.

One aspect of atmospheric turbulence is represented by the *gustiness*. Various specific definitions have been suggested in order to make a numerical evaluation possible. One of the simpler definitions in use gives the gustiness G in terms of the mean wind speed V_{mean}, the maximum V_{max} and the minimum V_{min}, all measured within a suitable interval such as 10 min.,

$$G = \frac{V_{max} - V_{min}}{V_{mean}}.$$

Within some 50 m. of the ground the gustiness found from this formula is usually between 0.25 and 1.00, meaning that the range in wind speed is between 25% and 100% of the mean wind speed.

Any individual turbulent fluctuation can be ascribed, in theory if not in practice, to a disturbance or *eddy* of a certain rough dimension. This dimension may be called the *scale* of the turbulence. The larger the scale, the less frequently a given type of disturbance passes a fixed point; so there is a direct relation, other factors being the same, between the scale of turbulence and its "period."

There is a wide range in the scale of atmospheric turbulence. Of the small-scale phenomena, the forms visible in tobacco smoke have already been mentioned; but fluctuations too rapid for the eye to follow exist close to the ground or near other solid objects past which a wind blows. The shapes assumed by smoke from a stack show eddies ranging in size from about 10 cm. up to 10 or 100 m. The updrafts revealed by cumulus clouds may be 100 or 1,000 m. or more in both horizontal and vertical extent. There is reason to believe that slowly moving eddies having a horizontal extent of between 10 and 100 km. are prevalent in the atmosphere, but the existence of these very large atmospheric eddies has not been demonstrated by direct evidence.

Two distinct mechanisms produce atmospheric turbulence. What is called *mechanical turbulence* derives its energy from the wind and results from the fact that the wind passing any fixed object is inherently unsteady. Even if the approaching air is in steady motion, it becomes turbulent in passing an obstacle unless the obstacle is of very small size. In any air current as fast as a light breeze the obstacle would have to be less than a millimetre in diameter to permit steady flow past it One effect of the unsteady nature of the flow past small obstacles is the singing of wires and whistling of branches in the wind. While the ground's roughness and the trees and buildings protruding above it add to the turbulence in the wind, the wind near the ground is turbulent, no matter how smooth and flat the ground may be.

To understand the last phenomenon, one should first realize that, since air, like all other fluids, has a certain degree of viscosity, as the ground is approached the wind velocity must gradually come to zero Now suppose a steady horizontal flow of the wind, with the velocity increasing upward from zero at the ground, exists at a certain instant It turns out that even very minor disturbances in this steady flow produce forces which cause the disturbances to grow into fully developed turbulence. Since very minor disturbances are never lacking, the flow is always turbulent.

The other mechanism is thermal instability, which produces *thermal turbulence* This kind of turbulence occurs next to the ground when the latter is considerably warmer than the air, and it occurs at any higher levels where such thermal instability exists. The thermal instability produces overturning, warm air rising and cold air sinking. This leads to an irregular, turbulent motion which gains its energy from the unstable distribution of mass Visible effects of thermal turbulence are the apparent dancing motion of objects seen across a hot pavement, the shimmering of a mirage caused by a warm surface and cumulus clouds All these result from masses of air rising through colder surrounding air.

Just as thermal instability produces turbulence, thermal stability impedes vertical turbulence When the air temperature increases upward, a parcel of air displaced upward is heavier than its surroundings and tends to sink back, while one displaced downward is lighter than its surroundings and tends to rise back to its origin. With such a stable temperature distribution, more energy is required to maintain a given degree of turbulence than would be needed in the absence of stability. Under otherwise similar conditions, turbulence is therefore less strong when thermal stability exists.

In the absence of either thermal stability or instability, the degree of mechanical turbulence has a small value at the ground and increases with height to a maximum, then decreases with further increase in height. The turbulence at any level, as well as the height of the maximum, increases with the wind speed and with the roughness of the ground With a fresh wind this mechanical turbulence can be quite noticeable in aircraft less than 500 m. above the ground. When the temperature distribution is stable, the degree of turbulence may be greatly reduced. On the other hand, when it is unstable, thermal energy as well as mechanical goes into turbulence, which therefore becomes more intense. Conditions of extreme turbulence are often found in large cumulus and cumulonimbus clouds.

While extremely large-scale turbulence has no direct effect on aircraft, mechanical turbulence due to ground friction or to fronts, and thermal turbulence due to heating from the ground or to heating by cloud formation, are frequently of a suitable scale and sufficient intensity to form *rough air* Extremely small-scale turbulence, much smaller than the aircraft, does not produce any effect of this sort but is very significant in determining the drag and hence the performance of the craft.

Rough air is made manifest to the aviator by accelerations of his airplane, airship or other craft. In general these accelerations may be vertical, sideways, positive or negative in the forward direction or a turning or tilting effect. In the case of an airplane, which travels forward swiftly, a sudden acceleration is experienced on passing from air of one velocity to air of another velocity. Furthermore, due to its shape and direction of flight, the vertical accelerations of a plane are much larger than the horizontal ones. If they are not uniformly distributed, tilting results as well as bumps and drops of the entire plane. Since a plane depends on its air speed for support, the vertical accel-

tions can result either from vertical currents or from a change in wind speed, and the effects of these two basically different causes are not commonly distinguishable. An upward acceleration, or bump, is experienced both on entering air which is rising more rapidly than the air through which the plane has been flying, a true updraft, and on entering air which is moving horizontally toward the plane more rapidly so that the air speed and lift are suddenly increased A downward acceleration, or drop, is experienced on entering a true downdraft and on entering air which is moving horizontally toward the plane less rapidly. Hence a bump does not necessarily indicate an updraft, nor does a drop necessarily indicate a downdraft.

Bumps and drops occur not only in turbulent air. An inversion of temperature sometimes lies a few hundred ft. above the ground or water and sharply separates nearly calm air in the surface layer from stronger wind above If a plane climbs on a course opposing the upper wind, on passing through the inversion it experiences a bump similar to that encountered on entering an updraft. If it flies downward through the inversion on the same course, as is normal in landing, the plane experiences a drop similar to the effect of a downdraft. If the latter occurs close to the ground, it may be alarming to the pilot. To guard against serious consequences, he should realize that such drops can occur without downdrafts and without turbulence

It is seen that all ground and water surfaces are covered by a layer of turbulent air, whose thickness may be as small as a few metres or as large as 1,000 m. or more. Nearly all phases of the meteorology and climatology of this layer are intimately associated with its turbulence. Atmospheric turbulence therefore plays an important part in all agricultural activities, having a marked effect, for instance, on the temperature of the ground and of leaves and on the rate of evaporation from them. One has difficulty, indeed, in calling to mind any activity on land or at sea which is not affected by it.

No discussion of atmospheric turbulence would be complete without mention that our knowledge of it has benefited from studies of oceanic turbulence, in many respects the studies of meteorology and oceanography have gone hand in hand to the advantage of both. Turbulent flow in all gases and liquids and in all sorts of models has basic features in common; as a consequence, meteorologists have taken over much that was learned about turbulence in aeronautics and hydraulics.

TURDIDAE: *see* THRUSH.

TURENNE, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE (1611–1675), marshal of France, second son of Henri, duke of Bouillon and sovereign prince of Sedan, by his second wife Elizabeth, daughter of William the Silent, prince of Orange, was born at Sedan on Sept. 11, 1611. He was educated in the doctrines of the Reformed religion and received the usual training of a young noble of the time; but physical infirmity, and particularly an impediment of speech (which he never lost), hampered his progress, though he showed a marked partiality for history and geography and especial admiration of the exploits of Alexander the Great and Caesar. After his father's death in 1623, he devoted himself to bodily exercises and in a great measure overcame his natural weakness. At the age of 14 he went to learn war in the camp of his uncle, Maurice of Nassau, and began his military career (as a private soldier in that prince's bodyguard) in the Dutch War of Independence Frederick Henry of Nassau, who succeeded his brother Maurice in 1625, gave Turenne a captaincy in 1626 The young officer took his part in the siege warfare of the period and won special commendation from his uncle, who was one of the foremost commanders of the time, for his skill and courage at the celebrated siege of Hertogenbosch (Bois-le-Duc) in 1629. In 1630 Turenne left Holland and entered the service of France. Cardinal Richelieu at once made him colonel of an infantry regiment. He still continued to serve at frequent intervals with the prince of Orange, who was the ally of France. In 1635 Turenne served under Cardinal de la Valette in Lorraine and on the Rhine. The siege of Mainz was raised, but the French army had to fall back on Metz from want of provisions. In the retreat Turenne measured swords with the famous imperialist, General Gallas, and distinguished himself greatly by his courage and skill. The reorganized army took the field again in 1636 and captured Saverne (Zabern), at the storming of which place Turenne was seriously wounded. In 1637 he took part in the campaign of Flanders and was present at the capture of Landrecies (July 26) and in the latter part of 1638, under Duke Bernhard of Saxe-Weimar (1608–39), he directed the assault of Breisach (reputed the strongest fortress on the upper Rhine), which surrendered on Dec. 17. He had now gained a reputation as one of the foremost of the younger generals of France, and Richelieu next employed him in the Italian campaign of 1639–40 under "Cadet la Perle," Henri de Lorraine, count of Harcourt (1601–66). On Nov. 19, 1639, he fought in the famous rearguard action called the battle of the "Route de Quiers" and during the winter revictualled the citadel of Turin held by the French against the forces of Prince Thomas of Savoy. In 1640 Harcourt saved Casale and besieged Prince Thomas's forces in Turin, which were besieging in their turn another French force in the citadel. The latter held out, while Prince Thomas was forced to surrender on Sept. 17, 1640, a fourth army which was investing Harcourt's lines being at the same time forced to retire. The favourable result of the complicated operations of this campaign was largely due to Turenne, who had by now become a lieutenant-general He himself commanded during the campaign of 1641 and took Coni (Cuneo), Ceva and Mondovi. In 1642 he was second in command of the French troops which conquered Roussillon. At this time the conspiracy of Cinq Mars (*see* FRANCE. *History*) in which Turenne's elder brother, the duke of Bouillon, was implicated, was discovered.

The earlier career of Turenne was influenced by the relations of the principality of Sedan to the French crown; moreover his steady adherence to the Protestant religion was an element of difficulty in Turenne's relations with the ministers. Cardinal Richelieu nevertheless entrusted him with the command in Italy in 1643 under Prince Thomas (who had changed sides in the quarrel). Turenne took Trino in a few weeks but was recalled to France towards the end of the year. He was made a marshal of France (Dec 19) and was soon sent to Alsace to reorganize the "Army of Weimar"—the remnant of Duke Bernhard of Saxe-Weimar's troops—which had just been severely defeated at Tüttlingen (Nov. 24–25, 1643). He was 32 years old at this time and had served under four famous commanders. The methodical prince of Orange, the fiery Bernhard, the soldierly Cardinal de la Valette and the stubborn and astute Harcourt had each contributed much to the completeness of Turenne's training, and he took the field in 1644 prepared by genius and education for the responsibilities of high command.

The work of reorganization over, Marshal Turenne began the campaign in June by crossing the Rhine at Breisach but was almost instantly joined by an army under the duc d'Enghien (afterwards the great Condé), who, as a prince of the royal house, took the chief command of the united armies of "France" and "Weimar." The four famous campaigns which followed brought to an end the Thirty Years' War (*q.v.*) The chief event of the first of these was the desperately-fought battle of Freiburg against Count Mercy's Bavarians (Aug. 3, 5 and 9, 1644), after which Philipsburg was successfully besieged. Before the capitulation Enghien withdrew and left Turenne in command. The marshal opened the campaign of 1645 with a strong forward movement but was surprised and defeated by Mercy at Mergentheim (Marienthal) on May 2. Enghien was again sent to the front with the army of France, and Turenne's army was greatly increased by the arrival of a Swedish force and a contingent from Hesse-Cassel The Swedes soon departed, but Enghien was at the head of 20,000 men when he met the Bavarians in a battle even more stubbornly contested than Freiburg. Mercy was killed and his army beaten at Allerheim near Nordlingen (Aug. 3, 1645).

Ill-health forced Enghien to retire soon afterwards, and Turenne was for the third time left in command of the French army. He was again unfortunate against the larger forces of the imperialists, but the campaign ended with a gleam of success in his capture of Trier (Trèves). In the following year (1646) he obtained more decided successes and, by separating the Austrians from the Bavarians, compelled the elector of Bavaria to make peace (signed March 14, 1647). In 1647 he proposed to attack the thus weakened army of the emperor but was ordered into Flanders instead. Not only was the opportunity thus lost but a serious mutiny broke out among the Weimar troops, whose pay was many months in arrear The marshal's tact and firmness were never more severely tried nor more conspicuously displayed than in his treatment of the disaffected regiments, among whom in the end he succeeded in restoring order with little bloodshed. He then marched into Luxemburg but was soon recalled to the Rhine, for in 1648 Bavaria had returned to her Austrian alliance and was again in arms. Turenne and his Swedish allies made a brilliant campaign, which was decided by the action of Zusmarshausen (May 17), Bavaria being subsequently wasted with fire and sword until a more secure pacification was obtained.

The peace of Westphalia (1648) was no peace for France, which was soon involved in the civil war of the Fronde. (*See* FRANCE: *History*.) Few of Turenne's actions have been more sharply criticized than his adhesion to the party of revolt. The army of Weimar refused to follow its leader and he had to flee into the Spanish Netherlands, where he remained until the treaty of Rueil put an end to the first war of the Fronde. The second war began with the arrest of Condé and others (Jan. 1650), among whom Turenne was to have been included; but he escaped in time and with the duchesse de Longueville held Stenay for the cause of the "Princes"—Condé, his brother Conti and his brother-in-law the duc de Longueville. Love for the duchess seems to have ruled Turenne's action, both in the first war and, now in seeking Spanish aid for the princes. In this war Turenne sustained one of his few reverses at Rethel (Dec. 15, 1650); but the second conflict ended in the early months of 1651 with the collapse of the court party and the release of the princes

Turenne became reconciled and returned to Paris in May, but the trouble soon revived and before long Condé again raised the standard of revolt in the south of France. In this, the third war of the Fronde, Turenne and Condé were opposed to each other, the marshal commanding the royal armies, the prince that of the Frondeurs and their Spanish allies Turenne displayed the personal bravery of a young soldier at Jargeau (March 28, 1652), the skill and wariness of a veteran general at Gien (April 7), and he practically crushed the civil war in the battle of the Faubourg St. Denis (July 2) and the reoccupation of Paris (Oct. 21). Condé and the Spaniards, however, still remained to be dealt with, and the long drawn out campaigns of the "Spanish Fronde" gave ample scope for the display of scientific generalship on the part of both the famous captains. In 1653 the advantage was with Turenne, who captured Rethel, St. Menehould and Muzon, while Condé's sole prize was Rocroy. The short campaign of 1654 was again to the advantage of the French; on July 25, the Spanish were defeated at Arras. In 1655 more ground was gained, but in 1656 Turenne was defeated at Valenciennes in the same way as he had beaten Condé at Arras. The war was eventually concluded in 1658 by Turenne's victory at the Dunes near Dunkirk, in which a corps of English veterans sent by Cromwell played a notable part (June 3–14); a victory which, followed by another successful campaign in 1658, led to the peace of the Pyrenees in 1659.

On the death of Cardinal Mazarin in 1661 Louis XIV took the reins of government into his own hands and one of his first acts was to appoint Turenne "marshal-general of the camps and armies of the king." He had offered to revive the office of constable of France (suppressed in 1627) in Turenne's favour if the marshal would become a Roman Catholic. Turenne declined Born of Calvinist parents and educated a Protestant, he had refused to marry one of Richelieu's nieces in 1639 and subsequently rejected a similar proposal of Mazarin. He had [illegible] married a daughter of the Protestant Marshal de la Force, to whom he was deeply attached. But he sincerely deplored the division of the Christian church into two hostile camps. How closely both he and his wife studied such evidence as was available is shown by their correspondence, and, in the end, two years after her death, he was prevailed upon by the eloquence of Bossuet and the persuasions of his nephew, the abbé de Bouillon, to give in his adhesion to the Orthodox faith (Oct. 1668). In 1667 he had returned to the more congenial air of the "Camps and Armies of the King," directing, nominally under Louis XIV, the famous "Promenade militaire" in which the French overran the Spanish Netherlands. Soon afterwards Condé, now reconciled with the king, rivalled Turenne's success by the rapid conquest of Franche Comté, which brought to an end the War of Devolution in Feb. 1668.

In Louis XIV's Dutch War of 1672 (*see* DUTCH WARS) Turenne was with the army commanded by the king which overran Holland up to the gates of Amsterdam. The dikes were opened and the country round Amsterdam flooded. This heroic measure completely checked Turenne, whom the king had left in command Turenne now fought a successful war of manoeuvre on the middle Rhine while Condé covered Alsace. In Jan. 1673 Turenne assumed the offensive, penetrated far into Germany and forced the Great Elector of Brandenburg to make peace; later in the year, however, he was completely outmanoeuvred by the famous imperial general, Montecuculli, who evaded his opponent, joined the Dutch and took the important place of Bonn. In June 1674, however, Turenne won the battle of Sinzheim, which made him master of the Palatinate. Under orders from Paris the French wasted the country far and wide. In the autumn the allies again advanced, and though Turenne was again outmanoeuvred, his failure on this occasion was due to the action of the neutral city of Strasbourg in permitting the enemy to cross the Rhine by the bridge at that place. The battle of Enzheim followed; this was a tactical victory but hardly affected the situation, and at the beginning of December the allies were still in Alsace. The old marshal now made the most daring campaign of his career. A swift and secret march in mid-winter from one end of the Vosges to the other took the allies by surprise. Sharply following up his first successes, Turenne drove the enemy to Turkheim, and there inflicted upon them a heavy defeat (Jan. 5, 1675). In a few weeks he had completely recovered Alsace. In the summer campaign he was once more opposed to Montecuculli, and after the highest display of "strategic chess-moves" by both commanders, Turenne finally compelled his opponent to offer battle at a disadvantage at Sassbach. Here, on July 27, 1675, he was killed by almost the first shot fired The news of his death was received with universal sorrow. Turenne's most eloquent countrymen wrote his *éloges*, and Montecuculli himself exclaimed: "Il est mort aujourd'hui un homme qui faisait honneur à l'homme." His body was taken to St. Denis and buried with the kings of France. Even the extreme revolutionists of 1793 respected it; and, when the bones of the sovereigns were thrown to the winds, the remains of Turenne were preserved at the Jardin des Plantes until Sept. 22, 1800, when they were removed by order of Napoleon to the Church of the Invalides at Paris, where they still rest.

Turenne was one of the great captains whose campaigns Napoleon recommended all soldiers to "read and re-read" His fame as a general was the highest in Europe at a period when war was studied more critically than ever before, for his military character epitomized the art of war of his time (Prince de Ligne) Strategic caution and logistic accuracy, combined with brilliant dash in small combats and constancy under all circumstances of success or failure may perhaps be considered the salient points of Turenne's genius for war. Great battles he avoided. "Few sieges and many combats" was his own maxim. And, unlike his great rival Condé, who was as brilliant in his first battle as in his last, Turenne improved day by day. Napoleon said of him that his genius grew bolder as it grew older; and a modern author, the duc d'Aumâle (*Histoire des princes de la maison de Condé*), takes [illegible]

jusqua'à Sulzbach. Chez lui chaque jour marque un progrès" In his personal character Turenne was little more than a simple and honourable soldier, endowed with much tact, but in the world of politics and intellect almost helpless in the hands of a skilful intriguer or casuist. His morals, if not beyond reproach, were at least more austere than those prevalent in the age in which he lived He was essentially a commander of regular armies His life was spent with the troops; he knew how to win their affection, he tempered a severe discipline with rare generosity and his men loved him as a comrade no less than they admired him as a commander. Thus, though Condé's genius was far more versatile, it is Turenne whose career best represents the art of war in the 17th century. For the small, costly and highly trained regular armies and the dynastic warfare of the age of Louis XIV, Turenne was the ideal army leader.

The most notable of the numerous portraits of Turenne are these of P de Champagne at Versailles and of Senn (dated 1670) in the Jones collection at South Kensington, London. Of the older memoirs of Turenne the most important are those of "Du Busson," *La Vie du vicomte de Turenne*—the author is apparently Gatien de Sandraz de Courtilz (Paris, the Hague and Cologne, 1688–95), Abbé Raguenet, *Histoire du vicomte de Turenne* (Paris 1741) and especially Ramsay, *Histoire d'Henri de la Tour d'Auvergne, vicomte de Turenne* (Paris 1735), the second volume of which contains the marshal's memoirs of 1643–58 These memoirs, of which the Prince de Ligne wrote that "ce ne sont pas de conseils, ce sont des ordres . . 'faites' . . . 'allez,' etc."—were written in 1665, but were first published (*Mémoires sur la guerre, tirés des originaux*, etc.) in 1738, reprinted in Michaud, *Mémoires sur l'histoire de France*, 31d series, vol iii, and Laskenne and Sauvan's *Bibliothèque historique et militaire*, vol. iv (Paris 1846) A manuscript, *Maximes de M de Turenne* (1644), exists in the Staff archives at Vienna; and of other documentary collections may be mentioned Grimoard, *Collections de lettres et mémoires trouvés dans le portefeuille de M. de Turenne* (Paris, 1782); *Recueil de lettres écrites au vicomte de Turenne par Louis XIV. et ses ministres*, etc (Paris 1791); *Correspondance inédite de Turenne avec Le Tellier et Louvois*, ed. Barthélemy (Paris 1874). *See* also the *Observations on the Wars of Marshal Turenne*, dictated by Napoleon at St Helena (1823), Puységur, *La Guerre par principes et règles* (Paris 1748); Précis in *Bibliothèque internationale d'écol. milit.* (Brussels 1883), Duruy, *Histoire de Turenne* (Paris 1880); Roy, *Turenne, sa vie et les institutions militaires de son temps* (Paris 1884); Hardy de Perini, *Turenne et Condé* (Paris 1907); Neuber, *Turenne als Kriegstheoretiker und Feldherr* (Vienna 1869); Sir E. Cust, *Lives of the Warriors of the 17th Century* (London, 1867); T. O. Cockayne, *Life of M de Turenne* (founded on Ramsay's work; London, 1853); G B. Malleson, *Turenne Marshal Turenne*, by "the author of the Life of Sir Kenelm Digby" (London 1907), is a valuable work by a civilian and is based in the main on Ramsay's work, the memoirs of Cardinal de Retz, James, duke of York, etc, and on Napoleon's commentaries. A remarkable parallel between Turenne and Condé, in Saint-Evremond's *éloge* of the latter, will be found in Carrion-Nisas, *Essai sur l'histoire général de l'art militaire*, ii, 83 (Paris 1824); C. G Picavet, *Les dernières années de Turenne 1660–1675* (1912), p. 513; General Weygand, *Turenne* (1929). (C. F. A.)

TURFAN, the name of a remarkable depression in the Tarim region south of the Tien-shan, here over 10,000 ft. in height. This is said to be 426 ft below sea level at the lowest point. The town of Turfan, just 30 mi. to the north, stands some 250 ft. above sea level, and the general level around the depression rapidly reaches over 2,500 feet. The depression is loess covered and would be fertile if it could be irrigated The town of Turfan is a double settlement, part Chinese and part Turki, with a population of 15–20 thousand. In the depression, the temperature varies from 90° for July, calculated at Lukchun, to 13° in January and the daily fluctuations are very great

TURGAI, a former province of Russian central Asia, now included in the Kazakstan (*q v.*) A.S.S R.; *see* also Aktubinsk.

The Turgai strait, a narrow passage over the watershed separating the Tobol and the Irgiz, between the east of the southern Urals and the west of the plateau region of the Kirghiz steppe, is of great structural importance. Through it came the marine transgressions of previous geological epochs; the upper Cretaceous advanced into the southwest only, but those of the upper Eocene and Oligocene extended along the east of the Urals and the Lower Oligocene sea of Germany reached the Arctic ocean During the age of the amber forests the Strait of Turgai was closed, and no sea again entered Siberia by that route The course of the Tobol river marks the direction of the ancient marine connection. At a recent epoch the present Turgai river, which enters Lake Chalkar-tenız and which receives the Irgiz as a tributary, flowed into the Sea of Aral, its volume being then much increased by tributaries which now lose themselves in the sand before reaching it.

See Suess *The Face of the Earth*, vol. III (1908).

TURGENEV, IVAN SERGEYEVICH (tōōr-gān'yĕv) (1818–1883), Russian novelist, was born at Orel of a family of provincial gentry. His father had married for money a woman older than himself, who made up for her thwarted affections by making herself a domestic tyrant to her children, as well as to her serfs. Turgenev was educated at home, at the Universities of Moscow and St Petersburg and finally (1839–40) at Berlin, where, in contact with young Russian intellectuals, he became a Westerniser In 1843 he published *Parasha*, a tale in verse, which was favourably reviewed by Belinsky. Turgenev deserted the civil service for letters and was infatuated with the famous singer, Paulne Garcia (Mme Viardot), this caused a breach with his mother, who cut off his allowance. He lived as a Bohemian until her death (1850) made him a rich man His lifelong affection for Mme Viardot, who merely tolerated his presence, met with no response but left a deep impress on his work. Turgenev abandoned poetry for the drama (which he also abandoned after 1852) and for prose fiction. His first great success was *A Sportsman's Sketches* (started 1847, in book form 1852), in which the peasants appeared more attractive than their masters. It was received as a protest against serfdom In 1852 Turgenev was exiled to his estate for a while because of his laudatory obituary on Gogol.

His masterpieces included short stories like *The Backwater*, *Asya*, *First Love* and the more ambitious novels *Rudin* (1856), *A Nest of Gentlefolk* (1858), *On the Eve* (1860) and *Fathers and Sons* (1862), in which the love plot was interwoven with current social issues. All were commented on at great length by the leading critics. His attempt, however, to draw a strong man in the person of the agnostic and materialist—"nihilist"—Bazarov was resented by the Radical press as a caricature Turgenev, being sensitive to criticism, was embittered against his countrymen and settled abroad, and his later works are mainly retrospective. The two novels in which he tried to deal with actuality, *Smoke* (1867) and *Virgin Soil* (1877), only show the depth of his bitterness and his complete loss of touch with contemporary Russia. However, his last visit to Russia (1880) was a triumphant progress. He died in 1883, at Bougival, near Paris

Turgenev was the first Russian author to be read and admired by Europe. During his last years he lived in close touch with the French literary world, contracted intimate friendships (especially with Flaubert) and was regarded as a master by younger men like Maupassant He was very popular in this French circle, but much less so among his Russian compeers: Tolstoy, Dostoyevsky and Nekrasov all sooner or later came to detest him.

Turgenev is the most poetical (in the 19th century acceptance of the word) of the Russian realists. He had undergone the profound influence of Pushkin (as well as of Lermontov and George Sand). His novels are largely variations on the theme of *Eugene Onegin*. His character drawing does not depend on analysis and psychology but on a subtly-woven poetic atmosphere that accompanies the characters like an aura. This applies mainly to his women; they are invariably stronger and more attractive than his men, who (with the single exception of Bazarov) are neurasthenic weaklings. His style is marked by a careful simplicity and elaborate naturalness that answered to the highest ideals of 19th century taste. Delicately-drawn landscape passages are among its most outstanding features.

Hapgood, with an introduction by Henry James (13 vols., 1903); *The Plays of Ivan Turgenev*, trans by M. S. Mandell, etc. (1924); *Pourgudneff and his French Circle* (letters, etc) ed by E. Halperne-Kaminsky (1898). *See* also Henry James in *French Poets and Novelists* (1878) and *Partial Portraits* (1888), E. Garnett, *Turgenev, a Study* (1917); A. Yarmolinsky, *Turgenev* (1926). (D. S. M.)

TURGEON, PIERRE FLAVIEN (1787–1867), archbishop of Quebec, was born in Quebec on Nov. 12, 1787. He was ordained in 1810 and became director of the Quebec seminary in

1821 after visiting England and Rome, 1819–20 He was instrumental in obtaining settlement of the status of the Catholic church in Canada. After serving as administrator from Nov. 1849, he became archbishop of Quebec in Oct 1850 and in that capacity brought about the organization of the province, and under him the first and second councils of Quebec convened in 1851 and 1854, respectively. He was the founder of Laval university, which opened on Sept. 1, 1852, and of La Maison du Bon Pasteur He held office until 1855 when ill health compelled him to resign. He died on Aug 25, 1867.

TURGOT, ANNE ROBERT JACQUES, Baron de Laune (1727–1781), French statesman and economist, was born in Paris on May 10, 1727, the youngest son of Michel Étienne Turgot, "provost of the merchants" of Paris. He was educated for the church, and at the Sorbonne, to which he was admitted in 1749 (being then styled abbé de Brucourt), he delivered two remarkable Latin dissertations, *On the Benefits which the Christian Religion has conferred on Mankind* and *On the Historical Progress of the Human Mind*. In 1750 he decided not to take holy orders, giving as his reason, according to Dupont de Nemours, "that he could not bear to wear a mask all his life." In 1752 he became *substitut* and later *conseiller* in the parlement of Paris, and in 1753 *maîtres des requêtes*. In 1754 he was a member of the *chambre royale* which sat during an exile of the parlement; in 1755 and 1756 he accompanied Gournay, then intendant of commerce, in his tours of inspection in the provinces and in 1760, while traveling in the east of France and Switzerland, visited Voltaire, who became one of his chief supporters. In Paris he frequented the salons, especially those of Mme Graffigny—whose niece, Mille de Ligniville, afterwards Mme. Helvétius, became his lifelong friend—Mme. Geoffrin, Mme. du Deffand, Mlle. de Lespinasse and the duchesse d'Enville. It was during this period that he met the leaders of the "physocratic" school, Quesnay and Gournay, and with them Dupont de Nemours, the abbé Mordellet and other economists All this time he was studying various branches of science and languages, both ancient and modern. In 1753 he translated the *Questions sur la commerce* from the English of Josias Tucker and wrote his *Lettre sur la tolérance* and a pamphlet, *Le Conciliateur*, in support of religious tolerance. Between 1755 and 1756 he composed various articles for the *Encyclopédie* and between 1757 and 1760 an article on *Valeurs et monnaies*, probably for the *Dictionnaire du commerce* of the abbé Morellet In 1759 appeared his *Éloge de Gournay*.

In August 1761 Turgot was appointed intendant of the *généralité* of Limoges, which included some of the poorest and most over-taxed parts of France; here he remained for 13 years. He was already deeply imbued with the theories of Quesnay and Gournay (*see* Physiocratic School) and set to work to apply them as far as possible in his province. He continued the work on the *cadastre*, or new official survey, begun by his predecessor Tourny in order to arrive at a juster assessment of the *taille;* he also obtained a large reduction in the contribution of the province He published his *Avis sur l'assiette et la répartition de la taille* (1762–70) and as president of the *Société d'agriculture de Limoges* offered prizes for essays on the principles of taxation. Quesnay and Mirabeau had advocated a proportional tax (*impôt de quotité*), but Turgot, a distributive tax (*impôt de répartition*). Another reform was the substitution for the *corvée* of a tax in money levied on the whole province, the construction of roads being handed over to contractors. In 1769 he wrote his *Mémoire sur les prêts à intérêt*, in which the question of lending money at interest was for the first time treated from a scientific, not from a moral standpoint. Among other works written during Turgot's intendancy were the *Mémoire sur les mines et carrières* and the *Mémoire sur la marque des fers*, in which he protested against state interference and advocated free competition.

During the famine of 1770–71 he enforced on landowners "the obligation of relieving the poor" and especially the *métayers* dependent upon them and organized in every province *ateliers* and *bureaux de charité* for providing work for the able-bodied and relief for the infirm. Turgot made the *curés* the agents of his charities and reforms when possible. In 1770 he wrote his famous *Lettres sur la liberté du commerce des grains* addressed to the comptroller-general, the abbé Terray. Three of these letters have disappeared, having been sent to Louis XVI by Turgot at a later date and never recovered

Turgot's best known work, *Réflexions sur la formation et la distribution des richesses*, written in 1766 for the benefit of two young Chinese students, appeared in 1769–70 in Dupont's journal, the *Éphémérides du citoyen*, and was published separately in 1776 After tracing the origin of commerce, Turgot develops Quesnay's theory that the land is the only source of wealth and divides society into three classes, the productive or agricultural, the salaried (*stipendée*) or artisan class and the land-owning class (*classe disponible*). He advocates the *impôt unique; i e*, that only the *produit net* of the land should be taxed, and the complete freedom of commerce and industry

On July 20, 1774, Turgot was appointed minister of marine through the influence of Maurepas; and on Aug 24 he became comptroller-general His first act was to submit to Louis XVI his guiding principles: "No bankruptcy, no increase of taxation, no borrowing" Turgot's policy, in face of the desperate financial position, was one of rigid economy in all departments. He contemplated a thorough-going reform of the *ferme générale* and, meanwhile, imposed certain conditions on the leases as they were renewed—such as a more efficient personnel and the abolition for the future of the abuse of the *croupes* (the name given to a class of pensions) and annulling certain leases, such as those of the manufacture of gunpowder and the administration of the *messageries*, the former of which was handed over to a company with Lavoisier as one of its advisers and the latter superseded by a better service of diligences which were nicknamed "turgotines." He also prepared a regular budget.

Turgot's measures reduced the deficit and raised the national credit to such an extent that in 1776, just before his fall, he was able to negotiate a loan with some Dutch bankers at 4%; but the deficit was still so large as to prevent him from attempting to realize his scheme of substituting for indirect taxation a single tax on land. He suppressed, however, a number of *octrois* and minor duties.

Turgot's edict for free trade in corn signed on Sept. 13, 1774, was strongly opposed in the *conseil du roi*. Turgot was hated by many in high places who had been interested in the speculations in corn and was opposed by Linguet and by Necker, who in 1775 published his treatise, *Sur la législation et le commerce des grains* But Turgot's worst enemy was the poor harvest of 1774, which led to a slight rise in the price of bread in the winter and early spring of 1774–75 and to those extraordinary bread-riots known as the "guerre des farines." Turgot showed great firmness and decision in repressing the riots and was loyally supported by the king throughout.

Turgot's famous "Six Edicts" were finally presented to the *conseil du roi* (Jan. 1776). The two which met with violent opposition were, firstly, the edict suppressing the *corvées*, and secondly, that suppressing the *jurandes* and *maîtrises*, the privileged trade corporations Turgot announced in the preambles to these his intention to subject the noblesse to taxation and to establish as a principle the right of every man to work without restriction.

He obtained the registration of the edicts by the *lit de justice* of March 12; but by that time he had won the hatred of the nobles and the parlements, the court, the "financiers," the clergy, the rich bourgeoisie of Paris and others. The queen disliked him for opposing the grant of favours to her protégés, and he had offended Mme de Polignac in a similar manner. Malesherbes and Maurepas ceased to support him, and Maurepas became reconciled with the queen and her party. About this time, too, appeared a pamphlet, *Le Songe de M Maurepas*, generally ascribed to the comte de Provence (Louis XVIII), containing a bitter caricature of Turgot.

Before relating the circumstances of Turgot's fall it might be well to summarize briefly his views on the administrative system. With the physiocrats, he believed in an enlightened absolutism and looked to the king to carry through all reforms.

As to the parliaments, he opposed all interference on their part in legislation, considering that they had no competency outside the sphere of justice. He recognized the danger of the recall of the old parliament but was unable effectively to oppose it since he had been associated with the dismissal of Maupéou and Terray and seems to have underestimated its power. He was opposed to the summoning of the states-general advocated by Malesherbes (May 6, 1775), possibly on the ground that the two privileged orders would have too much power in them His own plan is to be found in his *Mémoire sur les municipalités*, which was submitted informally to the king. In Turgot's proposed system landed proprietors alone were to form the electorate, no distinction being made between the three orders; the members of the town and country *municipalités* were to elect representatives for the district *municipalités*, which in turn would elect to the provincial *municipalités*, and the latter to a *grande municipalité*, which should have no legislative powers but should concern itself entirely with the administration of taxation With this was to be combined a whole system of education, relief of the poor, etc His large reforms amounted to a complete revolution and Louis XVI recoiled at the prospect.

Such a fundamental difference of opinion between king and minister was bound to lead to a breach sooner or later. Turgot's only choice, however, was between "tinkering" at the existing system in detail and a complete revolution, and his attack on privilege, which might have been carried through by a popular minister and a strong king, was bound to form part of any effective scheme of reform.

The immediate cause of Turgot's fall is uncertain. Some speak of a plot, of forged letters containing attacks on the queen shown to the king as Turgot's, of a series of notes on Turgot's budget prepared, it is said, by Necker and shown to the king to prove his incapacity Others attribute it to the queen, and there is no doubt that she hated Turgot for supporting Vergennes in demanding the recall of the comte de Guines, ambassador to London, whose cause she had ardently espoused Others attribute it to an intrigue of Maurepas. On the resignation of Malesherbes (April 1776), whom Turgot wished to replace by the abbé Véry, Maurepas proposed to the king as his successor a nonentity named Amelot Turgot, on hearing of it, wrote an indignant letter to the king, in which he reproached him for refusing to see him, pointed out in strong terms the dangers of a weak ministry and a weak king and complained bitterly of Maurepas's irresolution and subjection to court intrigues; this letter the king is said to have shown to Maurepas, whose dislike for Turgot it still further embittered

With all these enemies, Turgot's fall was certain; but he wished to stay in office long enough to finish his project for the reform of the royal household. This, however, he was not allowed to do On May 12, 1776, Turgot was asked to resign He retired to la Roche-Guyon, château of the duchesse d'Enville, returning shortly to Paris, where he spent the rest of his life in scientific and literary studies, being made vice-president of the Académie des Inscriptions et Belles Lettres in 1777. He died on March 18, 1781

In character Turgot was simple, honourable and upright, with a passion for justice and truth. He was an idealist, his enemies would say a doctrinaire, and certainly the terms "natural rights," "natural law," etc , frequently occur in his writings His friends speak of his charm and gaiety in intimate intercourse, but among strangers he was silent and awkward and produced the impression of being reserved and harsh Many of the reforms and ideas of the Revolution were due to him; the ideas did not as a rule originate with him, but it was he who first gave them prominence. Oncken looks upon him as a bad physiocrat and a confused thinker, while Léon Say considers that "though he failed in the 18th century he triumphed in the 19th"

BIBLIOGRAPHY —G Schelle, *Turgot* (Paris, 1909); and Marquis de Ségur, *Au Couchant de la monarchie* (Paris, 1910), contain much that is based on recent research. The principal older biographies are those of Dupont de Nemours (1782, enlarged in his edition of Turgot's *Works*, 1807–11) and Condorcet (1786), the best modern ones are those of A Neymarck (Paris, 1885), Léon Say (Paris, 1887) and W. W Stephens (London, 1895) See generally, Oncken, *Geschichte der Nationalokonomie*, vol. ii, ch 1, Schelle, *Dupont de Nemours et l'école physiocratique* (1888); Henry Higgs, *The Physiocrats* (1897); R. P. Shepherd, *Turgot and the Six Edicts* (1903), in Columbia Univ. Studies, vol xviii, no. 2; *Oeuvres de Turgot et documents le concernant, avec biographie et notes par G. Schelle* (5 vols, 1913–23)

TURI, a Shi'a Mohammedan tribe which holds the Kurram Valley in the Northwest Frontier province, India, and enjoys increasing prosperity. Divided into five clans, all apparently of Hindki (*q v.*) origin, the Turis wrested the valley from the Bangash Pathāns after 1700, distributing its lands as conquered so that every original settler's family now holds fields all over it. A sturdy race, whose "fathom" is reputed to be 6½ ft., they are distraught by faction but hospitable; and a Turi escort (*badragga*) is famed for its fidelity.

They threw in their lot with the Sunnite Pathāns (1851–56) but in the second Afghan War furnished Roberts with supplies and in 1892 accepted British protection.

TURIN, a city of Piedmont, Italy, capital of the province of Turin, formerly of the kingdom of Sardinia (until 1860), and of Italy till the removal of the seat of government to Florence in 1865. Pop. (1936) 608,211 (town), 629,115 (commune), thus showing rapid growth at the expense of the Alpine valleys (*see* ITALY). The area of the city is 6·5 sq mi., and its octroi circle measures nearly 9 mi.

Built upon alluvial soil 784 ft above sea level, it stands upon the river Po. The streets and avenues, almost all of which are straight, intersect at right angles In general it has a modern aspect, but its regularity of form is in reality derived from the ancient Roman town of Augusta Taurinorum, which formed its nucleus.

The mean temperature at Turin (1871–1900) is 53° F. (winter 35°, summer 71°), with an average maximum of 90° and an average minimum of 17°. Snow falls on an average only on seven days per annum. The rainfall averages 34 in.

The cathedral of St. John the Baptist (the see has been archiepiscopal since 1515) is a cruciform, Renaissance building dating from 1492–98 by the Florentine architect, Baccio Pontelli. Meo del Caprina being the contractor. Behind the high altar of the cathedral is the chapel of the Sudario or Sindone, built (1657–94) by Guarini as a royal burial-place The "sudario" from which it takes its name is asserted to be the shroud in which Joseph of Arimathea wrapped the body of Jesus La Beata Vergine della Consolata, another of Guarini's works, has a tower which belonged to the church of St Andrew, founded by the monk Bruning in 1014

Other churches of note are San Filippo (1672–1772), the largest in Turin, the dome of which fell in just as it was approaching completion under the hands of Guarini and was restored by Juvara, and La Gran Madre di Dio, erected to commemorate the return of the court in 1814 The Palazzo Madama was erected by William VII of Montferrat at the close of the 13th century on the Roman east gate of the town, remains of the towers of which were incorporated in it. It owes its name to the widow of Charles Emmanuel II, who added the west façade and the handsome double flight of steps from Juvara's design (1718). The extensive royal palace was begun in 1646 Many of the baroque palaces have fine pillared courtyards, some of them are the work of Guarini The tower of the citadel (1566) contains the artillery museum. The Castello del Valentino is partly in the French style of the 16th century It contains the polytechnic school and geological, mineralogical and industrial museums and the university botanical garden.

The university, founded about 1400 by Lodovico di Acaja, had more than 5,000 students before World War II There is also an engineering school and an institute of commerce and economics The old university buildings erected in 1713 by the Genoese architect, Ricca, contain the library, some treasures of which were lost by fire in 1906.

The academy of sciences, founded in 1757, is in a building erected in 1678 by Guarini and contains the local antiquities of Piedmont and Egyptian treasures partly collected by Drovetti, partly excavated in the present century at Thebes, Assiout, etc.

The pictures are by Van Dyck and by north Italian masters. There is a museum of zoology and mineralogy in Palazzo Carignano (another of Guarini's buildings), and the royal palace contains the royal armoury (a fine collection begun by Charles Albert in 1833) and the royal library with its rich manuscript collection and its 20,000 drawings.

There are many modern public monuments including those to Emmanuel Philibert (1838), Charles Albert (1861), Victor Emmanuel II. (1899), the Duke of Aosta (1902), Mazzini (1915). The Mole Antonelliana, built by Alessandro Antonelli, is used for the Risorgimento Museum. It is the highest brick edifice in Europe, its summit being 510 ft above ground, the dome being raised upon a hall with three galleries, one above the other. The newer parts of the city, extending towards the south beyond the stadium (1911) are finely laid out.

Among the hospitals is that called by the name of its founder, Cottolengo, a vast institution providing for more than 7,000 persons.

The industries comprise metallurgy, machine-making, chemicals, silk and cotton weaving, tanning and leather-working, artificial silk and fibres, matches, candles, soap, furniture, perfumes, glass, damasks, velvets, woollens, ready made clothing, etc. The manufacture of motor-cars has become of great importance. Turin is the chief seat of the industry in Italy. Aeroplanes are also manufactured: and chocolate, liqueurs and vermouth are made. The application of electricity is widely developed on account of the proximity of the Alpine valleys, and the hydro-electric plants of the Mont Cenis, the Val d' Aosta, and the Toce valley all concentrate on Turin.

Milan, owing to its nearness both to the St. Gotthard and to the Simplon, is the most important railway centre of Italy. Turin is however nearest to the Mont Cenis, while the completion of the line through Cuneo over the Col di Tenda now affords direct communication with the French Riviera.

On the Hill of Superga (2,300 ft. above the sea) Victor Amadeus II. erected a basilica in memory of the liberation of Turin from the French in 1706. King Charles Albert and other Savoy princes are buried in the crypt. Not far from Turin are also the royal castles of Moncalieri, Stupinigi, Rivoli, Racconigi, Agliè, Venaria Reale. Turin was made the chief town of Piedmont by Amadeus, first duke of Savoy (*See* SAVOY, HOUSE OF) Between 1536 and 1562 Turin was occupied by the French, and in 1630 it lost 8,000 of its citizens by the plague. The French were masters once more from 1640 to 1706, and again from 1798 till 1814, when Piedmont was restored to the house of Savoy. The town was heavily bombed In World War II by the Allies.

The ancient *Augusta Taurinorum* was a city of Gallia Cisalpina, the chief town of the Taurini. The natural advantages of its site and its position with relation to the pass over the Alpis Cottia (Mont Genèvre; *see* COTTIE RESOUAT) made it important, though Hannibal, after crossing the Alps in 218 B.C., was able to take it after a three days' siege. It was partly burned down in A.D. 69, but continued to be prosperous. The Roman town formed a rectangle 2,526 ft. by 2,330 (770 × 710 metres). This measurement is questioned by F. Haverfield, *Ancient Town-Planning* (Oxford, 1913) 87, but is confirmed by an article by U. Savoia in *Town-Planning Review* xii. (1927). The walls, which were 21 *ft. high, 7 ft. thick at ground level and 3 ft. at the top*, were standing till about 1600; and the north gate, the Porta Palatina, exists. The interior of the town was divided by seven streets from east to west and eight from north to south into 72 blocks (*insulae*), and the ancient pavement and the drains below it are frequently found under the streets of the central portion of the modern town, indicating that they follow the ancient lines. Remains of a theatre have been discovered in the palace garden.

See C. Promis, *Storia dell' antica Torino* (Turin, 1869); A. d'Andrade, *Relazione dell' ufficio regionale per la conservazione dei monumenti dei Piemonte e della Liguria, 7 seq.* (Turin, 1899).

(T. A.)

Battle of 1706.—Turin was besieged in 1706 by the French under La Feuillade (*see* SPANISH SUCCESSION, WAR OF THE) who was covered by another army under the duc d'Orleans. Eugene of Savoy (*q.v.*) marching to the relief of Turin with 30,000 Austrians and Germans, eluded Orleans and in mid-August appeared before the French siege lines The united armies of Feuillade and Orleans numbered over 70,000 men, but on Sept. 7 Eugene boldly attacked them in their entrenchments between the rivers Doria and Stura. After the usual artillery duel, Eugene gave the order to advance. The Brandenburgers on the left quickly got to within a few paces of the entrenchments, but were driven back by the French fire Eugene then led the Germans on his left in a brilliant attack which stormed the entrenchments. Seeing this, Eugene's cousin, the duke of Savoy, attacked the French centre and, after three repulses, stormed it, Orleans being wounded, and his lieutenant, Marshal Marsin, killed. The French tried to rally, but the garrison of Turin took part in the discomfiture of the fugitives. Feuillade raised the siege and joined Orleans in a disorderly retreat. Each side had about 3,000 killed and wounded, but 6,000 prisoners fell into Eugene's hands and French prestige in Northern Italy was destroyed.

TURINA, JOAQUIN (1882–1949), Spanish composer, was born at Seville on Dec. 9, 1882 He studied under D'Indy, in Paris, 1905–14, where he wrote an encyclopaedia (*Enciclopedia abreviada de la música*, Madrid, 1917). His principal works are *Procesión del Rocio* for orchestra; music for the morality play, *La adúltera penitente;* a dramatic work, *Jardín de oriente* (1923), a pianoforte quintet, a string quartet, *Escena Andaluze*, for viola, pianoforte and string quartet, *Poema de una Saluqueua*, and songs He died Jan. 14, 1949, in Madrid.

TURKESTAN; *see* TURKISTAN.

TURKESTAN (Hazret, Yasi), a town in the Kazakstan S.S.R., in 43° 8′ N., 68° 18′ E., on the Orenburg-Tashkent railway 20 mi. E. of the Syr-Dana river, alt. 833 feet. Pop. about 30,000 Its main industry is cotton, and it acts as a depot for the *collection of hides and wool.* It is an ancient town and in 1397 a Persian architect was commissioned by Timur (Tamerlane) to build a mosque in honour of the Kirghiz patron Hazret Yasavi

TURKEY, a republic of the near east, with an area of 296,184 sq mi, comprising 9,256 sq mi. in Europe (Eastern Thrace) and 286,928 sq mi. in Asia (Anatolia), as well as 451 sq mi of swamps and marshes and 3,256 of lakes It is bounded on the east by the U.S.S.R (366 mi.) and Iran (Persia) (296 mi.); on the south by Iraq (234 mi.) and Syria (490 mi.) and the Mediterranean sea; on the west by Greece (126 mi) and Bulgaria (124 mi.) and on the north by the Black sea.

Turkey in Europe is separated from Anatolia by the straits—the Bosporus, the Sea of Marmara and the Dardanelles—which form the only sea passage between the Black sea and the Mediterranean. It is bounded on the northeast by the Black sea, and on the southwest by the Aegean sea The western frontier with Bulgaria and Greece was determined by the treaty of Lausanne (July 24, 1923). It runs from Ayastafanos on the Black sea along the valley of the small river Rezvaya, across the Istranca mountains and continues westward to the river Tundzha (Tunja), which it crosses about 15 mi. N. of Edirne (Adrianople) From this point it turns southwest to the river Maritsa (Meric) which it strikes about 15 mi. upstream from Edirne. There the frontier with Bulgaria ends and that with Greece begins. The border follows the Maritsa to Edirne (Adrianople), where on the right bank the suburb of Karagach (Karaagac) and a small part of the railway are included in Turkey; then the river is followed to its mouth near Enos (Enez).

The islands of Imroz (Imbros) and Bozcaada (Tenedos) off the Dardanelles belong to Turkey; otherwise the Aegean and the Mediterranean coast line is the boundary to a point just south of the mouth of the Orontes (Asi) river where the frontier with Syria begins. The line runs irregularly east and north through mountainous country, enclosing Antakya (Antioch) and its lake, to Meydaniekbez, where it turns east across the Baghdad railway, which it crosses again at Cobanbey (see *Communications*, below). It then runs about one yard south of the railway to Nusaybin (Nisibis), where it again crosses it and turns slightly north to Cizre (Jezirat ibn Omar) on the Tigris which it follows in a southerly direction to its confluence with the Khabur (Habur). The

frontier with Syria, which ends at this point, was originally defined when the French withdrew from Cilicia in the Franco-Turkish agreement of Oct. 20, 1921, and was confirmed by the treaty of Lausanne (1923). Under the terms of this treaty the Antakya-Alexandretta district known as the sanjak of Alexandretta (Iskenderun) came within the French mandate for Syria but enjoyed a special administration by virtue of its large Turkish population. In 1939, when the grant of independence to Syria (*q.v.*) appeared imminent, the district was annexed to Turkey and became the Hatay province, the boundary of which, from the mouth of the Orontes to Cobanbey, became the western section of Turkey's frontier with Syria.

The question of the frontier with Iraq, in accordance with article 3 of the treaty of Lausanne, came before the council of the League of Nations and was defined in the Ankara convention of June 5, 1926. Delimitation was completed in 1928. The frontier starts from the junction of the Khabur with the Tigris about 80 mi. N.W. of Mosul, follows the Khabur and its tributary the Hazil Su northeastward into the mountains, then turns east and traverses the difficult Kurdish highlands to the Rubar-i-Shin where it turns south across the Semdinan Su to the Rubar-i-Haji Bey and follows this river in a northeasterly direction to its source in the Persian watershed.

A frontier commission was delimiting the boundary between Turkey and Persia when World War I broke out in 1914. In order to put an end to frontier incidents which had occurred, an *accord de délimitation* was signed on Jan. 23, 1932, and a further rectification of the line in the neighbourhood of Paki and Eli was settled on May 27, 1937. From the junction with the Iraqi frontier the line runs in a general northerly direction in mountainous country to a point about 25 mi. S. of Mount Ararat (the Agri Dag), where it turns east for about 20 mi. and then north to enclose this mountain until the river Aras (Araxes) is reached. There the frontier with Iran ends and that with the U.S.S.R. begins.

The frontier with the U.S.S.R. was defined in an annex to the treaty of Moscow (March 16, 1921) and by article 4 and three annexes of the treaty of Kars (Oct. 13, 1921). From a point roughly east of Ararat the boundary line follows the Aras to its junction with the Arpa, which it then follows, skirting the Alagoz volcano, to a point about 10 mi. W. of Leninakan (Aleksandropol). There the line swings in a great bow, northwestward over the Transcaucasian mountains and then westward, enclosing Kars, Ardahan and Artvin; crossing the river Coruh (Chorokh), it reaches the Black sea less than 10 mi. S. of Batum.

Physiography.—Turkey has been described as a bridge between Europe and Asia. Though the western end of the bridge has been broken down toward the Aegean and is interrupted by the straits, the customary division into European and Asiatic Turkey is an arbitrary one derived from the strategical and political importance of the straits. European Turkey is no more than the western continuation of the northern coast land of Anatolia. The geological upheavals which determined the formation of the land surface had not ended in the 20th century, as the disastrous earthquakes of modern times testify.

Turkey in Europe, a rough triangle with its apex on the Bosporus, has a northern and southern fringe of mountains, the Istranca and Tekirdag ranges, and a central undulating plain through which run the valleys of the Maritsa and the Ergene, draining the landward slopes of both highlands. East of the Maritsa and Tundzha rivers the central lowland is the only avenue from the west to Istanbul. About 25 mi. W. of Istanbul, a transverse ridge 600 ft. high crosses the peninsula from Terkos lake to Buyuk Cekmeca. This ridge is the foundation of the defensive system known as the Chatalja (Cataca) lines.

Asiatic Turkey (Anatolia) is roughly rectangular in outline, almost three times as long from east to west (about 900 mi.) as from north to south (about 300 mi.). Its main features are: (1) a central plateau extending nearly 500 mi. eastward from the latitude of Istanbul; (2) a mountainous girdle encircling the plateau on north, west and south and (3) an almost entirely mountainous region which becomes progressively wilder and more rugged up to the frontiers of the U.S.S.R. and Iran.

The central plateau is elevated to an average height of 3,000 ft. above sea level. Most of it is semidesert or steppe with scanty pasture except where the rivers flow through it with strips of fertile land bordering them. There are numerous depressions where marshes, shallow lakes or mud flats have been formed. Some of these are brackish because of the solubility of the rocks over which the water has reached them. The largest of these basins is a salt lake, Tuz Golu, in the centre of the plateau, about 60 mi. S. of Ankara (Angora). West of Ankara much of the country is rolling upland, between 3,500 and 4,500 ft. above sea level, with a few rounded summits nearly 6,000 ft. high. To the south and east of the capital is a region of rolling uplands with the remains of extinct volcanoes and, particularly in the neighbourhood of Kayseri (Caesarea Mazaca), lava and ash from them. To the north and northeast toward Sivas the level of the plateau rises, falling again in the direction of Amasya (Amasia) and Chorum (Corum). Near Sivas the Kizil Irmak (Red river) is at about 4,500 ft., and the central plateau is enclosed by mountain ranges on the east, northwest and southwest.

The Black sea coast between the Bosporus and the Soviet frontier is about 750 mi. long and has, throughout most of its length, steep, broken country near the seaboard. The breadth of the coast land is less easy to define. There is no clear dividing line between it and the central plateau in the western part, though to the east the character changes and there is a sharp division between the high mountain ranges on the coast and the hinterland. There is a fertile plain, the delta of the Sakarya river, between the gulf of Izmit and Eregli. Between Eregli and Inebolu the mountains rise to 3,000 ft. close to the sea and peaks inland to more than 6,000 ft. The hills are well forested, and the valleys between them, running from north to south, with branches parallel to the coast, are extensively cultivated. Coal is mined between Eregli and Cide. East of Inebolu the coastal range rises steeply from the sea and then falls abruptly about 30 mi. S. of the coast. Inland of Sinop, at Bafra where the Kizil Irmak reaches the sea and also east of Samsun are areas of coastal plain. Generally speaking, the inland belt is well-wooded, and the rounded mountains form a series of plateaus with fertile depressions between them. From Ordu to the Soviet frontier the features are a coastal range about 20–30 mi. from the shore, between which and the higher volcanic ranges to the south run the Kelkit and Coruh valleys.

Western Anatolia may be defined as the region west of long. 30° E., which comprises the Aegean coastland up to the central plateau. The coast line is deeply indented and has many natural harbours. The country bordering the Sea of Marmara is relatively low with streams running north or south, for which the hills around Balikesir are the collecting ground. The valley of the Simav separates these hills from the higher country to the east in which the forest-clad Ulu Dag (the Mysian Olympus of the ancients) stands about 8,000 ft. above the fertile slopes around Bursa (Brusa), ranges average more than 5,000 ft. to the Egrigoz Dag (7,000 ft.), about 50 mi. to the south. The fertile coastal region of Bergama (the ancient Pergamum) lies between the Simav valley and the three east-west valleys of the Gediz and the Kucuk and the Buyuk Menderes (the Little and the Great Maeander). The region to the east of Izmir (Smyrna), which is watered by the last two rivers, is bounded by two semielliptical chains of mountains, the western one of which rises to an average of 4,000–5,000 ft. with peaks reaching more than 7,000 ft. Between this and the eastern range, 200 mi. inland at its furthest point, is a rich alluvial plateau. To the south are rugged highlands which end abruptly at the Mediterranean coast west of the Dalaman valley.

The southern edge of the central plateau is followed by the railway from Afyon (Afyon Karahisar), which traces a wide curve southeastward through Konya (Konia) to Kaiaman and then northeast to Kayseri. Between this line and the sea lie the Taurus mountains. From the Dalaman valley on the west to Silifke on the east a bundle of ranges, not always continuous and sometimes ill-defined, enclose the Adalia (Antalia) plain. The main Taurus, an irregular chain to the northeast, dominates the Seyhan and Ceyhan coastal plains in which lie Mersin and Adana. It is broken by the

Cakit gorge which leads to the famous Cilician Gates, the route from the central plateau to the sea The Taurus, rising to more than 12,000 ft southwest of this gorge, ends south of Kayseri, which is overlooked by the separate volcanic group, the Erciyas (*the Mount Argaeus of the ancients*). East of the Seyhan lowland is the narrow strip of lowland along the sides of the Gulf of Alexandretta, at the head of which a gap between two parallel ranges forms the ancient Amanus Gates, the Kalekoi pass between the Misis Dag on the west and the Gavur Dag (classical Amanus) on the east. Beyond the Taurus to the east is a group of seven ranges, the Anti-Taurus, all of which have a general trend to the northeast. The Kurt Dag, the Gavur and the Misis are the southernmost of the group, but none has an inclusive name The central ranges are much cut up by tributaries of the Seyhan and Ceyhan rivers. There are numerous peaks with heights between 7,000 and 8,000 ft, and the Nuruhak Dag, southwest of Malatya, is 10,100 ft.

Southeastern Turkey may be defined as the belt bounded on the south by *the frontiers with Syria and Iraq, on the east by the* frontier with Iran and on the north by the mountain ranges which form the watershed of the Euphrates and the Tigris. The Euphrates basin, on the west, is an irregular strip through which the river runs between precipitous banks. Most of the villages are on tributaries well back from the river. Between it and the Tigris valley is a barren, undulating plain, north of which rise the rugged heights of the Kurdish Taurus. The Tigris rises near the Hazar lake, flows on an erratic course southeast to Diyarbakir and then east, fed by numerous tributaries on the way. It passes there between deep gorges turning south and then east to Cizre, where it meets the frontier with Syria.

East of the Tigris to the Iranian frontier lie the Kurdish mountains, with summits rising to more than 13,000 ft On the west *the country is wild, and rivers and their tributaries cut erratically* between the crests. In the centre the ranges end in precipitous cliffs facing southwestward, further to the east the country is lower and becomes milder to the Iranian frontier. The Great Zab (Buyuk Zap Su), the tributaries of which drain the extreme southeastern corner of Turkey, passes through deep gorges in wild and difficult country and, cutting through the Cilu range, crosses the Iraqi frontier.

Eastern Turkey north of this region to the Kelkit and Coruh valleys is largely volcanic, with cones rising to 11,000 ft or more surrounded by lava fields Some ranges of nonvolcanic origin vary an otherwise monotonous landscape The Murat Su, which rises north of Lake Van, almost in the shadow of Mount Ararat, crosses the area from east to west to join the Euphrates 250 mi. away Lake Van, which lies at 5,643 ft. above sea level, is about 80 mi. long from east-northeast to west-southwest and about 35 mi. across at its widest point; it has no outlet. Mount Ararat, a volcanic cone rising to 16,916 ft, is the loftiest of the Agri Dag group on the frontier of Soviet Armenia, south of Erivan.

Climate.—The structure of Turkey—a central plateau surrounded by coastal belts of mountains—gives regional variations in climate which generally follow the divisions described above, although local differences due to latitude, altitude and topography occur. The central plateau has hot, dry summers and cold winters with rain or snow between November and May The eastern part of the plateau is colder than the western in winter, the summers are cool in the north, but hot in the south. The change in climate is rapid from the Black sea coastlands to the plateau In this region the winters are mild on the coast; the summers are hot and damp. Fog and mist are frequent throughout the year Winter temperatures fall rapidly and rainfall increases from the coast to the mountain heights inland In western Anatolia the change in altitude from coast to plateau is less abrupt and the climatic change is more gradual. The summers are hot and dry; the winters near the coast are mild and damp but become colder inland with frost and some snow Rainfall is moderate (20–30 in.) on the coast and decreases inland On the southern coastlands the temperature in winter is moderate, and this is the warmest part of Turkey. The summers are hot and, particularly in the eastern coastal lowlands, oppressive because of the high humidity. In the southeastern region the summers are extremely hot but the winters are milder than on the central plateau. Eastern Turkey has wide variations of temperature because of its mountainous character, and the northeastern district (Erzurum-Kars), where snow lies for four months of the year, has the coldest winter in Turkey. The summers are hotter in the south than in the north, but reliable records are scanty for this region. *See* Table I.

TABLE I.—*Temperatures and Rainfall*

Station	Absolute maximum and minimum recorded temperatures (degrees Fahrenheit)			Mean annual rainfall	
	Max	Month	Min	Month	Inches

(K. C. B)

HISTORY

The first appearance of the Ottoman Turks in history dates *from the early 13th century According to the official tradition* of the Turkish historiographers, Ertughrul, the father of the first sultan, Osman, was a member of the tribe of Kayi, the most exalted branch of the Ghuzz (Oghuz) Turks, who had been driven from their home in central Asia by the advancing Mongols He and his small band of tribesmen found their way into Anatolia, where the Seljuk sultan Ala ud-Din Kaikobad I, in gratitude for their *timely intervention* when he was hard pressed by a superior Mongol army, gave the gallant stranger a grant of lands around Soghut. Modern research (notably by Paul Wittek; see *Bibliography*) proved the greater part of this romantic story false The weight of evidence is against Ertughrul's exalted Kayi genealogy. Nor was it tribal loyalty that held his followers to him, any more than it retained men's allegiance to his descendants for nearly seven centuries

From at least the early 9th century, there are records in the Moslem east of organizations of *ghazis*, (fighters for the faith), men sworn to wage ceaseless war on the infidel, through motives of religious zeal or greed for loot or both Such were the followers of Ertughrul Ertughrul was not the only ghazi leader to establish a dynasty; the beyliks (principalities) of western Asia Minor —Menteshe, Aidin (Aydin), Karesi, Sarukhan—were all founded by ghazis. So also was the Saffarid dynasty which ruled in Persia between 860 and 1000. When a ghazi organization settled down in a conquered territory, there was always a hard core of warriors who, remaining true to their purpose, refused to become peaceful citizens These would naturally move on to any place where the fight against the infidel was still being fought. In this fact lies the reason for the extraordinary success of the line of Ertughrul, their field of operations was on the frontiers of Byzantium, where in fighting the Christian a ghazi might best fulfill his destiny. The Ottoman power was therefore perpetually strengthened by an endless stream of recruits from the more settled lands to the south and east.

In assigning to Ertughrul the lands around Soghut, the Seljuks were only recognizing a *fait accompli* Soghut remained his headquarters, and when he died in 1281, at the age of 90, it was there that he was buried

THE OTTOMAN SULTANATE

Osman I (1281–1325).—Ertughrul was succeeded by his son Osman (*b.* 1258), the first sultan of the dynasty to which he gave his name ("Ottoman" is a barbarism for "Osmanli"). In 1284 he was confirmed in his dominions by the Seljuk sultan Masud. He proceeded steadily with the work of enlarging his territories, taking Karajahisar in 1291, Bilecik and Yarhisar, and then Inegol in 1299. About 1308 the Seljuk sultanate came to an end, and the

Mongol Ilkhanids of Persia and Mesopotamia, to whom the Seljuks had been tributary, entrusted Anatolia to a Mongol prince, Timurtash, who tried with no great success to bring all the principalities under his sway. The main opposition to him came from the bey of Karaman, a powerful state which later gave the Ottomans a great deal of trouble. The fall of the Seljuks is generally regarded by Ottoman historians as marking the beginning of Ottoman independence, but it is known that Osman's successor continued to pay a yearly tribute to the Ilkhanids.

Toward the end of Osman's life, infirmity compelled him to depute his authority to his son Orkhan by 1324. By the time of his death (1325 or 1326), his dominions extended over the triangle contained by Hendek in the north, Eskisehir in the south and Lake Apolyon in the west.

Orkhan (?1324–62).—Orkhan had won the succession through his military ability, his elder brother Ala ud-Din being a man of pacific and scholarly temperament (he is generally identified, on no good authority, with the Ala ud-Din Pasha who served as vizier to the first two sultans). In 1326 the Ottoman forces captured Bursa, which had been under siege since 1315. In 1329 a Byzantine army under the personal command of the eastern Roman emperor Andronicus III was defeated at Pelecanon (Maltepe); and Nicaea (Iznik) fell shortly afterward. In 1336 Orkhan profited by a dynastic quarrel in the neighbouring beylik of Karesi to annex a portion of its territory, including Pergamum. This acquisition placed a number of experienced seamen at the disposal of the Ottomans. The next year Nicomedia (Izmit) was wrested from the Greeks, and by about 1340 the Byzantine possessions in Asia Minor had been reduced to a few coastal towns near Constantinople.

A period of consolidation followed, until 1345, when dissension among the Greeks gave the Turks a bridgehead in Europe In that year the usurper John Cantacuzenus appealed to Orkhan for aid against the rightful emperor John V Palaeologus. An Ottoman force was promptly dispatched which penetrated into the Balkans, inflicted a heavy defeat on the loyalists and returned laden with booty. John Cantacuzenus gave Orkhan his daughter in marriage; then, in 1352, as a reward for further help, he permitted the sultan to garrison the fortress of Chimpe on Gallipoli. He soon realized his mistake when the Ottomans advanced from this base to occupy the rest of the peninsula; his suggestion that Orkhan should sell Chimpe back to him and evacuate Gallipoli was not accepted After the usurper's downfall in 1355, John Palaeologus was obliged to recognize Orkhan's territorial acquisitions in Rumelia. The sultan did not neglect his eastern frontiers; in 1354 an army commanded by his son Suleiman Pasha took Ankara from the son of Ala ud-Din Ertena, an Ilkhanid governor-general who had established himself at Sivas. Orkhan died in 1362 and was succeeded by his son Murad, Suleiman Pasha having predeceased his father by three years.

Murad I (1362–89).—The reign opened brilliantly with the capture of Adrianople and Philippopolis by Lala Shahin Pasha. The efforts of the Greek emperor, in alliance with the doge of Venice, to expel the Turks from Europe came to nothing, in consequence of the Ottoman policy of settling nomads from Anatolia in the conquered territories. Although the exact date is not known, it was probably about this time that the corps of janissaries (*q.v.*) was founded, with Christian youths captured in the wars. In 1363 an allied army of Serbs, Bulgars, Walachians, Bosnians and Hungarians, headed by Louis I of Hungary, was routed on the Maritsa. Two years later Murad made Adrianople his capital and began to enrich it with palaces and mosques. By 1369 the conquest of eastern Thrace was completed The Serbian ruler of Kyustendil, an important iron-mining centre, became tributary to the Turks in 1372, and Lazar I Hrebelyanovich of Serbia was soon obliged to follow his example During the subsequent lull in hostilities the flow of Turkish settlers to the newly acquired lands continued and the foundations of Ottoman administration were firmly laid there.

The temporary peace did not interrupt the enlarging of the Ottoman territories. Murad married his son Bayezid to Devlet Khatun, daughter of the bey of Germiyan (Kermian), his southern neighbour. Her dowry consisted in the major portion of her father's lands, including the city of Kutahya From this convenient base Murad intimidated the bey of Hamid into selling him a large part of his principality, contiguous to the frontiers of Karaman Ali Bey of Karaman, probably in league with the ruler of Hamid, persuaded Stephen I Tvrtko, king of Bosnia, to attack the Turks in Rumelia and then took advantage of Murad's absence in Europe to occupy the former Hamidian provinces. Murad left Jendereli Khair ud-Din Pasha to deal with the situation in Rumelia and returned to Anatolia, with Byzantine and Serbian auxiliaries, to crush Ali Bey at Konia (1387). An Ottoman force under Timurtash Pasha invaded Bosnia but was totally defeated by a combined Bosnian and Serbian army. The princes and kings who had consented to pay tribute were encouraged to rebel by this success. Murad appealed for help to the Anatolian beys; some complied, including those of Germiyan and Hamid, but not Karaman. Murad then returned to Europe with a large force and sent Chandarlizade Ali Pasha northward; the fortresses of Shumla, Pravadi, Trnovo, Nicopolis and Silistria were taken by him. Ivan Shishman III, the rebel king of Bulgaria, was punished and his country once more subjugated. Ali Pasha then joined his master at Kosovo. There Lazar of Serbia had collected an army of 100,000 Serbs, Hungarians, Moldavians, Walachians and others. On Aug. 27, 1389, the greatest of the battles of Kosovo was fought. Lazar was captured and his army cut to pieces, but after the battle Murad was slain. Serbian tradition tells that he was assassinated by Milosh Kobilovich, a Serb who approached him on the plea of submission.

Murad was succeeded by his eldest son, Bayezid. His second son, Savji, had plotted with Andronicus, son of the emperor John Palaeologus, to dethrone their respective fathers. The attempt failed; Andronicus was ordered by his father to be blinded and Savji was put to death (1385).

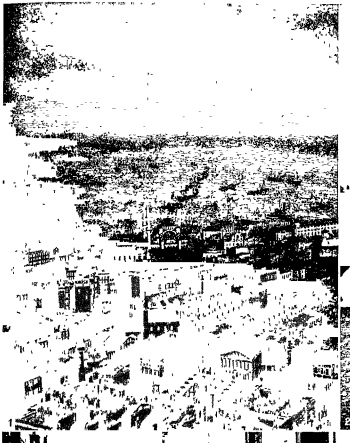
Bayezid I (1389–1403).—After being proclaimed on the field of Kosovo, Bayezid ordered the execution of his remaining brother Yakub. There is some evidence that in killing his brother the new sultan was following the example set by his father on his accession. Lazar II, otherwise called Stephen, Lazar I's son and successor on the throne of Serbia, made haste to conclude peace with Bayezid; he acknowledged his suzerainty and gave him his sister in marriage. Turks and Tatars were settled between Nish and Uskub Skoplje. The sultan then returned to meet a grave threat in Anatolia. The bey of Karaman, on hearing of Murad's death, had roused the beys of Aidin, Sarukhan and Menteshe against the Ottomans. Independently of these, Yakub of Germiyan was resolved to take back the lands that had gone to make his sister's dowry. Bayezid acted with great promptness. In the winter of 1390 he overran Aidin and Menteshe and then marched east to occupy Germiyan. In his retinue was Manuel, son of the emperor John V Palaeologus. Kara Timurtash Pasha was appointed *beylerbeyi* (governor-general) of Anatolia, with his headquarters at Kutahya. In the spring of 1391 the Ottomans invaded Karaman. Hearing that the Walachians, in league with the dispossessed beys, were in revolt, Bayezid made peace with Karaman and, by a brilliant march to the Danube, put down the rebellion. Meanwhile Manuel Palaeologus, learning of his father's death, hastened to Constantinople to claim the throne as Manuel II, without obtaining leave from the sultan. Bayezid therefore blockaded the city At the end of seven months, the new emperor not only agreed to pay an increased tribute but also consented to the building of a mosque in the capital and to the appointment of a kadi to judge between Moslems residing there. The reason for the sultan's willingness to lift the blockade was that Sigismund of Hungary, later western emperor, had, with Walachian help, entered Bulgaria, capturing Nicopolis from the Turkish garrison. At the news of Bayezid's approach, Sigismund withdrew and the sultan returned to Anatolia to crush the turbulent ruler of Kastamuni (1392). At the end of 1394 Bayezid sent envoys to Egypt, requesting that the caliph should recognize him as sultan of Rum; and this was done.

In the same year Pope Boniface IX had proclaimed a crusade against the Turks. The attack came in 1396, when armies from

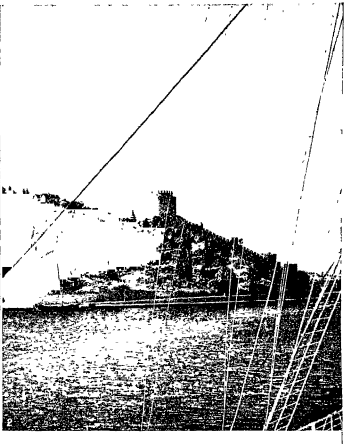
many European countries assembled in front of Nicopolis So elated were the allies by some minor initial successes that Sigismund even spoke of going on to the conquest of Jerusalem. The speed of Bayezid's advance was such that the crusaders at first refused to believe the reports of his proximity. Their overconfidence resulted in their annihilation. After this victory the siege of Constantinople was resumed, and about this time the fortress of Anadolu Hisari, on the Asiatic side of the Bosporus, was built. It seems that the Ottoman plan was to starve the city, rather than to take it by assault, but as the Turkish naval forces were negligible the Byzantines had no difficulty in obtaining supplies and reinforcements by sea. Bayezid overran Thessaly in 1397 and, until the spring of 1402, carried out a series of raids on the Morea, leaving colonies of Turks to hold the captured districts. In 1397 the sultan also took Konya after a siege and killed the bey of Karaman, who had attacked Ankara and captured Timurtash Pasha while Bayezid was fighting Sigismund at Nicopolis. The Ottoman territories were also extended in the northeast, to march with the empire of Trebizond.

Meanwhile Timur (Tamerlane) had started from Samarkand on his victorious career. After devastating Georgia in 1400 he marched against the Turks. Some of the dispossessed princes of Asia Minor had begged Timur to reinstate them Bayezid replied to a request to this effect from Timur in terms which made war inevitable. An attack in force was postponed by Timur's activities in Syria and Mesopotamia. But in 1402 in a great battle near Ankara the Turks were defeated and Bayezid was taken prisoner. Eight months later he died at Akshehir, probably by his own hand. This disaster checked the Ottoman advance for more than a decade. Timur reached Bursa and looted it, although Suleiman, Bayezid's eldest son, who fled after the battle, had forestalled him in carrying off the Ottoman treasury. One after another the Anatolian cities of the Ottomans were seized and plundered by the Tatars.

(G. L. L.)



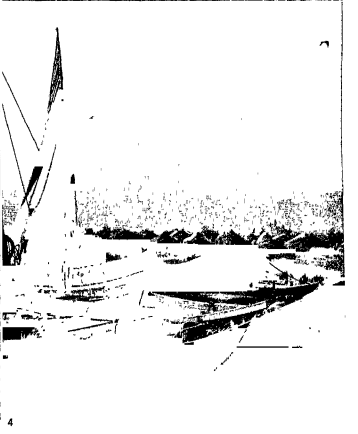
Mohammed I (1413–21).—Timur had sent letters after the fugitive sons of Bayezid promising to confer on them their father's dominions and protesting that his invasion had been due merely to the insulting tone adopted toward him by Bayezid and to the entreaties of the dispossessed princes of Asia Minor He did not cross into Europe, but moved eastward after capturing Smyrna and restoring the dispossessed beys. For some time further, disputes between the sons of Bayezid delayed the Turkish revival. However, Mohammed I (*q.v.*), the youngest, was recognized as sultan in 1413 and recovered nearly all his father's territories in his reign of eight years. Two years after his accession he compelled the prince of Karaman to yield up a number of his cities and then, turning northward, forced Mircea, voivode of Walachia, to pay tribute. The Turkish dominions in Asia Minor were extended, Amasia, Samsun and Janik being captured, and an insurrection of dervishes was quelled. In 1421 the sultan died. His services in the regeneration of the Turkish power were great. Amid the cares of state he found time for works of public utility and for the support of literature and art; he is credited with having sent the first embassy to a Christian power, after the Venetian expedition to Gallipoli in 1416. He was succeeded by his son Murad.



Murad II (1421–51).—Shortly after his accession the emperor Manuel, having applied in vain for the renewal of the annual subsidy, paid him by the late sultan for retaining in safe custody Mustafa, an alleged son of Bayezid (see MOHAMMED I), released the pretender. After ruling in Rumelia for more than a year he was defeated and hanged at Adrianople (1422), and Murad thereupon laid siege to Constantinople to avenge himself on the emperor. The siege was raised because the appearance of another pretender, in the person of Murad's 13-year-old brother Mustafa, under the protection of the revolted princes of Karaman and Germiyan, called the sultan to Asia. Mustafa, delivered up by treachery, was hanged (1424); but Murad remained in Asia, restoring order in the provinces, while his lieutenants continued the war against the Greeks, Albanians and Walachians. Constantinople withstood a siege in 1422, but by the treaty signed on Feb. 22, 1424, shortly before his death, the emperor Manuel II, in order to save the remnant of his empire, agreed to the payment of a heavy annual tribute and to surrender all the towns on the Black sea except Selymbria and Derkos and those on the Struma (Strymon) river Peace was also made at the same time with the despot of Serbia and the voivode of Walachia, on the basis of the payment of tribute. By 1426 the princes of Germiyan and Karaman had submitted on honourable terms, and Murad was soon free to continue his conquests in Europe. Of these conquests the most conspicuous was that of Salonika. Garrisoned by 1,500 Venetians, the city was carried by storm (March 1, 1430); the merciful precedent set by Mohammed I was not followed, the greater part of the inhabitants being massacred or sold into slavery and the principal churches converted into mosques.

By this time it was widely recognized that a further Turkish advance could be prevented only by the combined action of the northern peoples now definitely threatened. In 1442 a force of Slavs and Magyars under the voivode Janos Hunyadi (*q.v.*) drove the Turks from Nagyszeben (Sibin) In the following year they were expelled from Smederevo, which they had conquered a few years previously. Meanwhile, again confronted by a rebellion of the prince of Karaman, Murad had crossed into Asia and obtained his submission, granting him honourable terms in view of the urgency of the peril in Europe. On July 12, 1444, a ten years' peace was signed with Hungary, whereby Walachia was placed under the suzerainty of that country. Conscious of failure, Murad abdicated in favour of his young son Mohammed and retired to Manisa (Magnesia) in 1444. Pope Eugenius IV urged the king of Hungary to take advantage of this favourable opportunity, and 19 days after the truce had been concluded a large army headed by Wladyslaw I of Hungary, Hunyadi and Cardinal Cesarini crossed the Danube and reached Varna. In this emergency Murad was implored to return to the throne After some hesitation he agreed and, crossing over with his Asiatic army from Anadolu Hisari, hastened to Varna and routed the allies. Murad is said to have abdicated a second time and to have been again recalled to power because of a revolt of the janissaries. In 1446 Corinth, Patras and the north of the Morea were added to the Turkish dominions. The latter years of Murad's reign were troubled by the successful resistance offered to his arms in Albania by Skanderbeg (*q.v.*). In 1448 Hunyadi, now governor of Hungary, collected the largest army yet mustered by the Hungarians against the Turks, but was defeated on the famous field of Kosovo. In 1451 Murad died at Adrianople, being succeeded by his son Mohammed

Mohammed II the Conqueror (1451–81).—After suppressing a fresh revolt of the prince of Karaman, the new sultan gave himself up entirely to the realization of the long-cherished project of the conquest of Constantinople. After building in 1452 the Castle of Europe (Rumeli Hisari) Mohammed began the siege in 1453. Constantine XI Palaeologus, the last emperor, failed to obtain support from the west, the defenders of the city were vastly outnumbered by the Turks and on May 29, 1453, it was carried by assault. The sultan triumphantly entered the palace of the emperors, and the next Friday's prayer was celebrated in the church of St. Sophia.



Secure in his possession of Constantinople the sultan proceeded northward and entirely subdued the southern parts of Serbia. A siege of Belgrade was unsuccessful, because of the timely succour afforded by Hunyadi (1456). Two years later internal dissensions in Serbia brought about the conquest of the whole country by the Turks, only Belgrade remaining in the hands of the Hungarians. Walachia was next reduced to the state of a tributary province. Because Venice adopted a hostile attitude after Turkey's conquests in the Morea, greater attention was devoted to the fleet; Mytilene was captured and the entrance to the straits fortified. The conquest of Bosnia, rendered necessary by the war with Venice, was next completed, in spite of the reverses inflicted on the Turks by the Hungarian king Matthias Corvinus, the son of Janos Hunyadi. The Turks continued to press the Venetians by land and sea; Albania was overrun; and Venice was forced to agree to a treaty by which she ceded to Turkey Scutari (Shkoder) and Kroia, and consented to pay an indemnity of 100,000 ducats (Jan. 25, 1478). The Crimea was next conquered and bestowed

as a tributary province on the Tatar khan Mengli Ghirai Mohammed now endeavoured to strike a blow at Rhodes, the stronghold of the Knights of St. John, preparatory to carrying out his long-cherished plan of conquering Italy. A powerful naval expedition was outfitted but failed, though a land attack on southern Italy at the same time was successful, Otranto being captured and held for a time by the Turks In 1481, setting out on campaign, the sultan died at Gebze. He is said to have been of a merry and even jocular disposition, to have afforded a generous patronage to learning and art and to have been master of six languages.

Mohammed II was the organizer of the fabric of Ottoman administration in the form which it retained practically unchanged until the reforms of Mahmud II and Abdul-Mejid. He raised the regular forces of the country to a total exceeding 100,000. Under him the independent princes of Asia Minor were finally subjugated Many educational and benevolent foundations were endowed by him, and it is to Mohammed II that the organization of the ulema, or legist and ecclesiastical class, is due.

Bayezid II (1481–1512).—Bayezid reached the capital before his brother Jem and ascended his father's throne. To win over the followers of his brother he paid an accession present to the janissaries. this became an established custom. Jem's attempts to seize the throne were defeated. He took refuge with the Knights of Rhodes, but they were paid to keep him in custody. He was removed to Europe and, after 13 years' captivity, died in Naples He was said to have been poisoned by Pope Alexander VI, who received 300,000 ducats from Bayezid, but from *Taj-ut-Tevarih*, the most reliable history of the period, his illness sounds like erysipelas.

Bayezid was a man of peace by nature and quite incapable of directing the warlike tendencies of the young empire. He abandoned Otranto and exempted Venice from her yearly tribute by imposing instead a 4% customs duty on Venetian goods imported. In 1492 the armies of the Turks invaded Laibach in Carniola and Cilli in Styria. In 1494 they were driven out of Styria by the emperor Maximilian. While Bayezid was fighting against his brother's claims, Moldavians attacked Turkish territory in Walachia and he was forced to lead another Turkish army into Moldavia. The khan of the Crimea, Mengli Gheraï, fought in this army, and through his influence political correspondence was opened between Russia and Turkey, and the first Russian ambassador, Mikhail Belsechev, arrived in Constantinople. Moldavia became a vassal state after two years of war. John Albert, king of Poland, invaded Moldavia in 1496; and this was followed by a counterinvasion of the Turks, but they were forced to return by the severe winter. In 1496 Hercegovina was annexed to the empire, and in 1500 the Polish wars ended with an armistice. Rome and the Italian states had encouraged the sultan to crush the Venetian republic. The Turks gained over Venice their first great naval victory at Lepanto on July 28, 1499, and concluded peace on Dec. 24, 1502; a part of Morea and a few islands passed to Turkey, Venice retaining Cephalonia. On the Asiatic side Ismail Safavi, the shah of Persia, inspired with religious zeal for the propagation of Shi'ite doctrines, raided the empire (1501). The sultan attempted a pacific solution but failed to restrain his warlike son Selim from fighting the Persians. Shah Ismail's propaganda rooted the Shi'ite doctrines so firmly in Anatolia that in spite of the sanguinary repressions during the reign of Selim I, and the republican law of 1925 abolishing the dervish orders, adherents of the Kizilbash and other Shi'ite sects remain there to this day. Bayezid had also to fight the Egyptian armies under the Mamelukes who had invaded Adana, and he drove them out.

Selim then turned upon his father and, having won the janissaries to his side with promises of conquest, forced him to abdicate. Bayezid died on his way to his retreat at Dimotika. The political influence of the janissaries on the frequent change of sultans dates from this episode.

Selim I the Grim (1512–20).—True to his promise Selim kept the janissaries in action throughout his reign. After defeating his brother's claims, he attempted to exterminate Shi'ism not only in Anatolia but in Persia which was its centre. In 1514 he annihilated Shah Ismail's forces at Chaldiran and conquered Azerbaijan and Kurdistan. His most important conquests were Syria and Egypt, which he added to the empire after defeating the Mamelukes in 1516 and 1517. According to most Turkish and western historians he obtained from the last of the Abbasid caliphs, Mutawakkil, the title of caliph. (After the fall of the caliphs of Baghdad in 1258, the descendants of the Abbasids took refuge in Cairo and enjoyed a purely titular authority under the protection of the Egyptian rulers) But the important authority of the *Taj-ut-Tevarih* implies that Selim did not base his Pan-Islamism on the prestige of the caliphate, for the *Fetih-Name* (the declaration of conquest) of Selim himself, as there quoted, has no reference to caliph or caliphate. Another contemporary historian, Hasan Tulun, a Mameluke and an admirer of Selim, in his *History of Egypt*, also implies that Selim meant to realize Pan-Islamism through force rather than through the assumption of the title of caliph. He assembled the ulema in Egypt and, referring to the fact that the Mamelukes always had their sultan consecrated by the caliph, asked whether this was necessary: the ulema declared that the sultanate depended on force rather than on consecration. The sherif of Mecca, Abu'l-Baraka, sent his son with the holy relics and the keys of holy places to Selim. But though these relics are the emblems of the caliphate it is probable that Selim wished virtually to abolish it. Not until 1774 did a sultan claim also to be caliph.

An important revolt, led by Jelal who pretended to be the mahdi, broke out at Yozgad in Anatolia, but was at once suppressed and from this date *Jelali* came to be a general term for "rebel."

Selim, who died in 1520, never fought against the Christian west. Possessed by the ideal of uniting the Moslem east, he directed his campaigns accordingly. During his reign of eight years the empire nearly doubled its extent. Although he uprooted corruption and the people enjoyed a severe but just administration, his cruelty in executing eight grand viziers is alluded to in the popular saying: "May you be vizier to Sultan Selim." He was a distinguished poet, but wrote almost exclusively in Persian. His love of culture and learning was shown by his preference for the company of the learned. Although among his subordinates he punished small offenses with death, his sheikh ul-Islam, Ali-Jemali Efendi, who was fearless and outspoken, was able to make him desist from his plan of converting the Greeks to Islam by the sword if necessary, by reminding him of the conqueror's (Selim's grandfather's) firman, which gave religious freedom to the Greeks. At one time Selim tried to make Arabic the official language, to further his Pan-Islamic policy.

Suleiman I the Magnificent (1520–66).—Suleiman (Soliman) I, known as the "Magnificent" in the west and the "Lawgiver" in Turkey, being an only son, was saved from the wars of succession which his predecessors had to fight. He began his reign with the magnanimous act of freeing all the prisoners of war and restoring the goods confiscated from the merchants who traded with Persia in Selim's time. But this record is marred by the execution of two of his sons. That of the older, Mustafa, was thought due to the influence of his wife, the famous Khurrem Sultan, known as Roxelana (the daughter of a Russian priest), in order to leave her own sons without a rival. With her began the influence of women in affairs of state. She was also believed to have influenced the execution of the able grand vizier Ibrahim Pasha in order that his power might pass to Rustem Pasha, her son-in-law.

Suleiman's conquests were mostly in the west, though he had some Asiatic campaigns. He first marched into Hungary in 1521 ostensibly because his envoy had been slighted and because he received no congratulations on his accession. But actually he was resuming the northwestward march of his house that had been blocked by Hunyadi in 1456. He captured Belgrade, which remained a base throughout the Turkish wars in Europe. In 1522 Rhodes and Cos were conquered. In 1526 the Hungarians were severely defeated at the battle of Mohacs (*see* HUNGARY: *History*), their king, Louis II, killed and the greater part of Hungary including Budapest taken. The Turks appointed John Zapolya, the voivode of Transylvania, to be king of the Magyars. The sultan then left Hungary to put down a Shi'ite rising in Tabriz.

Ferdinand, the brother of the emperor Charles V, then claimed the Hungarian throne as the brother-in-law of Louis II, invaded Buda and drove out Zapolya, who naturally appealed to Suleiman. In 1529 Suleiman with Zapolya marched into Hungary, seized Buda and defeated the Austrians, and Zapolya was reinstated Encouraged against Charles V by Francis I of France, Suleiman laid siege to Vienna, but after three weeks was obliged to abandon it. Part of the Turkish army went as far as Regensburg in Germany. In 1532 Suleiman again marched against Charles V and approached Vienna, but in 1538 a truce was signed and Hungary was divided between Zapolya and Ferdinand.

During his Persian wars Suleiman retained the friendship of Ferdinand; but in 1540 Zapolya died and Ferdinand marched on Buda. Suleiman decided to uphold the claims of Zapolya's son and of his widow Isabella. He marched into Hungary, defeated Ferdinand and placed the young king on the throne under the regency of his mother. Suleiman refused all overtures of peace and war continued both on land and sea. In 1542 an alliance between Francis I and Suleiman led to a combination of the Turkish and the French fleets against Charles V. On land, Suleiman took Esztergom, Vizegrad, Szekesfehervar and a part of Hungary that became a Turkish province consisting of 12 sanjaks. On June 15, 1547, a truce of five years was signed in Adrianople between Suleiman, Charles V and Ferdinand which recognized the Turkish conquests and bound Ferdinand to pay a yearly tribute of 30,000 ducats to Turkey for the territory left to him John Sigismund, the son of John Zapolya, was recognized as the independent prince of Transylvania and of the 16 adjacent Hungarian counties, Queen Isabella to act as regent during his minority.

The terms of the treaty were soon ignored Ferdinand being in league with Frater Gyorgy (*see* MARTINUZZI, GEORGE) to free Transylvania from the Turkish suzerainty, Suleiman sent a large army under Sokollu Mohammed Pasha into Hungary. Lippa and Temesvar were taken but a victory of the Persians in the east forced Suleiman to sign an armistice in 1553 and invite Austrian delegates to Constantinople to negotiate for peace. The negotiations failed and war continued with atrocities on both sides till 1562. On June 1, 1562, peace was concluded between Suleiman and Ferdinand, who had been crowned emperor. Ferdinand undertook to pay all his arrears of tribute to Turkey and to continue a yearly payment of 30,000 ducats, to leave Temesvar and other towns to Suleiman, to recognize the independence of John Sigismund in Transylvania and to withdraw all his Habsburg claims to interference in Hungary.

In 1564 Ferdinand died and Maximilian II succeeded him Maximilian attacked Tokay, which was in Turkish possession, and let the tribute fall into arrears. Sokollu Mohammed Pasha, the new Turkish grand vizier, desired to wipe out the disgrace of a naval defeat in Malta which had ended in the death of Adm. Torgut, and Suleiman in 1566 led an army into Hungary, although 72 years old. He died during the siege of Szigetvar, but his death was kept secret by Sokollu till the fortress fell. Thus Suleiman, after ruling 46 years in life, ruled 46 days after his death, until his son Selim ascended the throne and reached Belgrade.

On the Asiatic frontier in 1526 Shah Tahmasp of Persia had taken Tabriz from the Turks while Suleiman was fighting at Mohacs. On his return Suleiman set out for Persia with an army, conquered the Armenian plateau and joined another Turkish army commanded by Ibrahim Pasha which had already recaptured Tabriz. The Persians retreated without fighting and in 1534 Suleiman took Baghdad.

In 1536 the French ambassador, Jean de la Foret, negotiated a treaty between France and Turkey by which certain judicial and economic privileges were granted to France. This marks the beginning of the capitulations which, started when Turkey was a powerful empire, were at first regarded only as the means of procuring an easy market for Turkish goods in France. They led, however, to serious and enduring political complications and became the pretext for exploiting Turkey in her decadent days. In 1555 Suleiman concluded a treaty of peace with the Persians at Amasia after conquering Georgia, the Armenian plateau and Erzurum.

Murad II had begun the building of the Turkish navy but it was during Suleiman's reign that Turkey became a first-rate sea power At no other time did Turkey have such a large number of famous admirals. Suleiman had conceived the idea of using the renowned corsairs who raided the Spanish and Irish coasts and he had engaged Khair ud-Din Barbarossa (*see* BARBAROSSA). Barbarossa was the son of a Turkish spahi, Yakub, a Macedonian, and his mother was Greek, his native place being Mytilene. He presented to Turkey Algiers, which he had personally conquered, and he formed what was called *Garb Ojaklari* (the states of Barbary) This was a military organization which administered Algiers, Tunis and Tripoli. Barbarossa took Tunis but was driven out by the fleet of Charles V, who devastated Tunis and destroyed mosques and valuable libraries because the Turks had converted churches into mosques in Hungary. Barbarossa's greatest naval victory was in 1538 when he defeated the combined fleets of the emperor, the pope and Venice under the command of Andrea Doria, off Prevesa. He took Castelnuovo and a few islands of the archipelago and he restored Morea to the Turkish empire. Torgut (known as Dragut in the west) was another famous corsair who had ravaged the Italian and Spanish coasts and was now engaged by Suleiman. He captured Tripoli from the Knights of Malta and was appointed its governor. He died in 1565, after an unsuccessful attack on Malta. Suleiman sent an expedition by sea to India in 1537, which conquered Aden on the homeward voyage. Piale Pasha, Piri Reis, Salih Reis, Seydi Ali Reis, were other renowned admirals of this period Piri Reis and Salih Reis conquered the coasts of Yemen and Aden as far as the gulf of Basra. Piri Reis compiled a detailed sea atlas (*Bahriye*) of the Aegean and Mediterranean He also conquered Muscat but was finally executed on the grounds that he had accepted bribes from the Portuguese to lift the siege of Ormuz. Seydi Ali Reis, a distinguished mathematician, succeeded him in the command of the fleet and was also defeated by the Portuguese. He escaped to the Indian ocean with three ships on which he lived for three years; then he landed and reached Turkey by land He wrote his travels (*Mirat ul-Memalik*), a mathematical book on the astrolabe and a book called *Muhit* (Ocean) on the navigation of the Indian seas.

The Ottoman State in the 16th Century.—The Ottoman state evolved gradually from a society whose institutions were fundamentally nomadic. The power was divided between two classes. the military class representing force and the ulema representing religion. The judges belonged to the latter class, but their judgments were executed by the military. All executive power centred in the military. The sultan himself, whose autocratic person was the symbol of this power, was a soldier, as were the viziers, the leading administrators. During war the governing body accompanied the army, this being characteristic of a nomadic system. The most remarkable feature of the Ottoman state was that, down to the 18th century, the holders of almost every important post were slaves, most of them acquired by the impressment of Christian boys. The majority of the *kapikullari* (slaves of the Porte) were trained as janissaries in barrack schools. Those who showed promise of suitability for high office were sent to a school attached to the palace, where they were taught the Moslem humanities (Persian and Arabic), music and practical arts and crafts. (*See* Barnette Miller, *The Palace School of Muhammad the Conqueror* [1941].)

Suleiman's administration was one of the best of his time. The Christian population in Morea preferred the Turkish rule to that of the Venetians, and some Hungarian villages chose Turkish rule of their own accord. Financially Turkey was in a good position; it had been enriched by the addition of prosperous lands, the revenue was 183,000,000 aspres (though expenditure was 6,000,000 more) and no new tax was levied during this reign. The countries belonging to the empire were administered in two different ways. One part was ruled by the central government and consisted of 24 vilayets (provinces), 4 of which were in Europe and 20 in Asia and Africa. The second part was more or less self-governing under the suzerainty of the sultan and consisted of the kingdoms of Hungary and Transylvania, the principalities of Moldavia and Walachia, the khanate of Crimea and the sherifate of Mecca,

which was ruled by the descendants of the prophet. The *Garb Ojaklari* (the states of Barbary), consisting of the provinces of Tripoli, Algiers and Tunis, had semi-independent governors who selected their own administrative bodies and later were empowered to make independent treaties.

After the conquest of Constantinople and the transfer of the capital to the imperial city, the Turkish system was somewhat influenced by that of the Byzantine empire. The affairs of state were discussed at the imperial divan over which the sultan presided until the reign of Mohammed the Conqueror, after which the sultans thought it more in keeping with their imperial dignity to hear the proceedings from behind a grating. The permanent members of the imperial divan consisted of three or more viziers (pashas with three horsetails), the grand vizier being the chief of these and invested with supreme power by the signet of the sultan. He held the title of *serdar-i-ekrem* (generalissimo) when in command of the army, in which case one of the other viziers remained behind as *kaymekam* (lieutenant). The viziers in the divan were called *kubbe vezirleri* (viziers of the dome), because of the nature of their meeting place. Their deliberations were attended by the following dignitaries. the *kasaskers* of Rumelia and Anatolia (the two highest judges of the empire); the *kadi* (judge) of Istanbul; the *defterdar* (minister of finance); the *nishanji* (keeper of the great seal); the *yenicheri aghasi* (commander of the janissaries); the *kaptan pasha* (lord high admiral) and the *reis ul-kuttab* (chief secretary, later the foreign minister).

Each vilayet was governed by a pasha (two horsetails) called a *beylerbeyi*. These provinces were divided into *sanjaks*, each being governed by a pasha (one horsetail) called *sanjakbeyi* The *sanjaks* were divided into *kazas*, each being governed by a *kadi*.

The Turkish army during Suleiman's reign probably numbered between 200,000 and 300,000, and was one of the best disciplined and best equipped of the time. The main elements of the army were the janissaries and the spahis, the latter comprising feudal cavalry and standing cavalry divisions. Other important units were the *jebeji* (armourers), the *topju* (artillery) and the *bostanji* (originally gardeners, later police).

The land was divided into several categories: *vakuf*, *yurtluk-ojaklik*, *timar*, *zamet* and *khas*. The revenues of *vakuf*-lands provided for the upkeep of mosques, schools, hospitals and other pious purposes. *Yurtluk-ojakliks* were lands in frontier districts, the revenues of which went to the frontier guards. The other three terms denoted fiefs whose revenues amounted to 2,000–20,000 aspres, 20,000–100,000 aspres and more than 100,000 aspres respectively. Some of these fiefs provided incomes for members of the imperial house and for successive holders of the great offices of state, while others were assigned to spahis. Only the latter sort were hereditary.

Selim II (1566–74).—Selim II, after pacifying the janissaries with payments, tried to undermine the power of Sokollu, the grand vizier, but finally found himself obliged to let the country be ruled by that great statesman. The conquest of Samos was completed and the risings in Yemen suppressed by Sinan Pasha. In 1568 the peace between Austria and Turkey was renewed for eight years. With the idea of joining the rivers Don and Volga by canal so that a fleet might be sent to the Caspian sea, Sokollu attacked Astrakhan but failed in his project. Turkish historians credit him also with the intention of opening a Suez canal. Cyprus was invaded by the Turkish army under the command of Lala Mustafa Pasha, who violated the capitulations of Famagusta (1571) by executing the Venetian commander Marco Antonio Bragadino, and aroused strong feeling against the Turks. Venice, Spain and the pope united in a holy league against Turkey and their combined fleets under the command of Don John of Austria severely defeated the Turkish fleet at Lepanto (1571). A year later the advance of a new Turkish fleet commanded by Kilij Ali Pasha caused Venice to break from the league and conclude a treaty with the Turks (March 7, 1573). In 1574 Sinan Pasha and Kilij Ali Pasha recaptured Tunis and ravaged Sicily. Selim died in 1574.

Murad III (1574–95).—Murad, Selim's eldest son, opened his reign by murdering his five younger brothers. He also tried to undermine Sokollu's power and in spite of his advice opened a war with Persia which lasted 12 years. The Turks conquered Shirvan, Tiflis and Daghistan and peace was concluded when Abbas, the successor of Tahmasp, was firmly established as shah of Persia. Sokollu's efforts to build an observatory in Istanbul were opposed by fanatical opinion; and his assassination, which soon followed, is said to have been ordered by the sultan. This threw the country into disorder, for there was no man who had Sokollu's strength and authority to oppose the harem intrigues and corruption. The janissaries, refusing to accept a debased coinage that was called "Jewish money," mutinied throughout the empire. This mutiny had scarcely been suppressed when in 1593 the uncertain peace between Austria and Turkey degenerated into a regular war which is known as the "long war." This began when Hasan Pasha, the governor of Bosnia, raided the Austrian frontiers and attacked Sisak. The Austrians and the Hungarians together routed the Turks in Kulpa with great slaughter. Sinan Pasha, the grand vizier, marched on Hungary with a large army, and war continued for 14 years. Bribery, which had become widespread in the country, corrupted the army as well, and there was no office which was not susceptible to the bribe of the highest bidder. Shemsi Pasha, one of Murad's counsellors, openly boasted of having made a sultan take bribes for the first time. Veszprem and Gyor were conquered by the Turks but the Moldavian and Walachian revolts checked further victories. The sultan's Venetian wife, Safiye Sultan (Baffo), ruled for many years as his only wife, accepted bribes and interfered in state affairs, influencing the Porte's relations with Venice, although in later years she had rivals. Murad, who died in 1595, is said to have had 130 children. The capitulations with France were renewed in 1581, those with Venice in 1589 Capitulations were signed with the grand duke of Tuscany for the first time in 1578, and with Great Britain for the first time in 1580. The first British ambassador sent to Turkey was William Harborne. Elizabeth in her letter to the sultan urged as a special claim to his friendship their common mission to fight the "idolaters," an interesting example of diplomacy.

Mohammed III (1595–1603).—Safiye Sultan, who had wielded such a strong influence as wife, continued to do so as mother during this reign. The new sultan began by murdering 19 of his brothers. The war in Hungary became chronic and intrigues between Sinan Pasha and Ferhad Pasha for the position of grand vizier led to frequent changes of command in the army, with disastrous results. Sinan persuaded the sultan to command the army in person, with good results at first, for in 1596 the Turks recaptured Eger (Erlau) and in three days defeated the allied armies at Keresztes. Because the sultan was anxious to return to his easy life in the capital and because the undue severity of Chighala Sinan Pasha was causing the Anatolian troops to desert, the Turks did not gain much by their victory. Ibrahim Pasha, Safiye Sultan's favourite, became grand vizier through her influence and she sold by proxy all the high offices of state. In 1598 Gyor, Tata, Veszprem and Papa were lost by the Turks. In 1599 overtures for peace were made by all sides without result. The unique military achievement of this campaign was that of Tiryaki Hasan Pasha, who in 1600 captured Kanizsa. A year later the attempt of the archduke Ferdinand to retake it at the head of 30,000 men was defeated. Military mutinies and Jelali insurrections broke out in the interior and Shah Abbas marched on Tabriz and Erivan. The sultan died in 1603.

Ahmed I (1603–17).—Ahmed I succeeded his father at the age of 14. The war with Persia continued fitfully during his reign. The Turks recaptured Esztergom in Hungary. Transylvania passed to the suzerainty of Turkey of its own accord; Stephen Bocskay, a member of its own aristocracy was appointed king. But the continual mutinies of the janissaries and the reverses in Persia forced Turkey to sign for the first time at Zsitvatorok a treaty of peace on terms of equality with Austria. Austria was freed from future tribute to Turkey by paying 200,000 ducats down, and for the first time the emperor was referred to as *padishah* in the official Turkish documents. A treaty of peace was also concluded between Turkey and Persia in 1611, Persia giving to Turkey as indemnity 1,000,000 lb. of silk. Kuyuju ("pitman") Murad Pasha, so called because he threw the bodies of rebels into

pits, suppressed the Jelali risings in Anatolia. Friendly relations with Poland were restored

Ahmed I was of a religious disposition, and left the affairs of the state to his grand vizier. In this reign it was decided to relax the custom of killing the brothers of every new sultan. They were, instead, to be confined each in a separate pavilion enclosed in a walled garden, known as *kafes* (cage) The evil result of this humane decision was that when a sultan was succeeded by a brother and not by a son the new ruler was inevitably a man with no experience of the world or of state affairs At Ahmed's death his sons were minors and, as it was contrary to custom for a minor to succeed, his brother Mustafa became sultan (1617).

Mustafa I and Osman II (1618–22).—Sultan Mustafa being an imbecile was after three months declared incompetent to rule and Osman II, son of Ahmed, ascended the throne Sokollu's idea that friendship with Persia would be politically to the advantage of the empire was adopted by the sultan and peace was concluded with that country. Moldavia revolted and joined the Poles, and Osman marched on Hotin. The expedition was a failure and diminished the prestige of the sultan. From his contact with them he knew how utterly degenerate and useless a body the janissaries had become and decided to discipline and reform them. He pretended to go on a pilgrimage to Mecca with the intention of marching back to the capital with a loyal and well-disciplined army which he hoped to raise in Syria and Arabia. When a rumour of this reached the janissaries they revolted After marching the sultan through the streets of Istanbul and exposing him to ignominious insults they killed him.

Mustafa I (1622–23), Murad IV (1623–40), Ibrahim I (1640–48).—Mustafa I was once more dragged to the throne by the janissaries but he soon abdicated in favour of his nephew Murad IV, still a minor Till the sultan was of age the empire was in the hands of his mother, Kosem Sultan, who had to cope as well as she could with the mutinous army and the corrupt state. The army chose the grand viziers and massacred them when it wanted a change. Kosem Sultan had to open the treasury to appease these revolts, which depleted the finances still more. When Murad IV was of age he restored order by one of the bloodiest reigns of history. Marching on Baghdad and Erivan he recaptured them from the Persians, repeating the atrocities which the Persians themselves had committed. He concluded a peace with Persia which fixed the Turko-Persian frontiers On his return he murdered all his brothers with the exception of Ibrahim and continued to terrorize his officials by frequent executions. He died in 1640.

The decline in the Ottoman power continued during the reign of Murad's eccentric brother and successor, Ibrahim I. Ibrahim devoted himself to pleasure and was ruled by the women in the palace while his mother Kosem Sultan once more took the reins of power. It is not surprising that complete anarchy reigned throughout the empire, the capital included. A campaign against Crete, which belonged to the Venetians who had burned some Turkish ships, began during this reign, but continued for 25 years. For the first time the Dardanelles were closed by Venetian ships, which caused a famine and led to a revolt. Ibrahim wanted to massacre the Christians, but the ulema were able to restrain him. The change of the residence of the ambassadors from Istanbul to Pera dates from this event. Ibrahim was dethroned during a mutiny and killed.

Mohammed IV (1648–87).—Mohammed IV, the seven-year-old sultan, succeeded his father and for another eight years the affairs of state were in the hands of Kosem Sultan, his grandmother. The janissaries had supreme power, monopolizing everything, even the sale of bread. Mohammed's mother, Turhan Sultan, tried to get the power into her hands and the period of anarchy and mismanagement was prolonged by the struggle between the two women, each depending on a different military party. Turhan Sultan accused her mother-in-law of trying to poison the boy sultan and one evening she contrived that her party should invade the palace and surprise Kosem Sultan in her room. Kosem Sultan's great oratorical powers, which had enabled her to control janissary risings, failed to save her life and she was strangled with the cords of her bed curtain Turhan Sultan now put Kuprili Mohammed into power as grand vizier, the first of five from the same family of Kuprili (*q.v.*; properly Koprulu) who did much to restore the empire He restored order in the army by very drastic measures, rebuilt an efficient navy, defeated the Venetians and recaptured the island of Lemnos and other islands. The improved condition of the army led to the pacification of Transylvania which was in revolt Kuprili Mohammed Pasha died after being in office five years and his son Ahmed became grand vizier. In 1663 disturbances in Transylvania caused the Turks to attack the Austrians. At first Turkish arms were victorious; but the French, who had been alienated by the haughty demeanour of the Kuprilis, sent help to the Austrians under Raimando Montecucculi, the Austrian general, and the Turks were defeated at the battle of Szent Gotthard abbey. They lost little in the treaty of Vasvar (Aug. 10, 1664), by which a truce of 20 years was agreed upon. Transylvania was evacuated but remained tributary to Turkey. The Turks retaliated on the French by depriving those Catholics who were under French protection of some of their privileges in the holy places and granting them instead to the Orthodox Church. The Cretan campaign was still in progress and the French were helping the Venetians, but the Turks took Candia and a treaty was signed in 1669 between the Venetians and the Turks which left Crete in the possession of Turkey while the island fortresses of Suda, Spinalonga and Grabusa remained Venetian.

Events in the Ukraine led Turkey into war with Poland in 1672. The Turks captured Kamenets, Lemberg and Lublin. The Poles sued for peace and a treaty was signed in 1672 at Buczacz whereby Podolia was ceded to Turkey and the Ukraine left to the Cossacks; Poland consented to pay Turkey an annual tribute of 22,000 sequans. But John III Sobieski, who ascended the Polish throne, refused to abide by the terms of this treaty and war was renewed and continued till 1676, when the treaty of Zurawno was signed, both parties abrogating the tribute clause.

Kuprili Ahmed having died, Kara Mustafa succeeded him as grand vizier A man of great military ambitions, he led Turkey into a series of unnecessary wars. The first was against the Russians, and although the Turks were successful at the beginning, their losses were so great that they signed a treaty at Radzin (Jan. 8, 1681) ceding the disputed territory to Russia. The internal disputes in Austria caused by Protestant persecution caused Kara Mustafa in 1683 to violate the truce signed by Kuprili Ahmed and lead a vast army against Austria which laid siege to Vienna. The emperor and his court fled from the capital, but John Sobieski of Poland saved the Austrian cause by attacking the Turks in the rear and defeating them. The failure at Vienna marks clearly the beginning of Ottoman decline. It kindled the crusading spirit in Europe against Turkey and an alliance between Austria, Venice, the pope, Poland, Russia, Malta and Tuscany was formed. The Austrians made conquests in Hungary, the Venetians in Greece, the Russians in Crimea and the Poles in Podolia. Turkey tried in vain to get France to join it against this general alliance. The janissaries mutinied and Mohammed IV abdicated.

Suleiman II (1687–91), Ahmed II (1691–95), Mustafa II (1695–1703).—Mohammed's brother Suleiman II succeeded to the throne. Kuprili Mustafa was made grand vizier, and true to the tradition of his illustrious family, he restored order in the army and in the fleet, and by wise and tolerant administration won the sympathies of the non-Moslem subjects. The Austrians captured Erlau, entered Transylvania and reached Belgrade and Uskub, but Kuprili Mustafa drove them out and recaptured Belgrade. He also defeated the Russians in Crimea. Mustafa went as far as to distribute seeds for the crops of the people of the recaptured countries. In 1691 while the Turkish army was fighting in Morea Suleiman II died and was succeeded by his brother Ahmed II.

The Turks were defeated at Slankamen (Szalankemen) in Croatia in Aug. 1691 and Kuprili Mustafa was slain on the battlefield. An attack on Petrovaradin was equally a failure and the Venetians captured the island of Chios. In 1695 Ahmed died and was succeeded by his nephew, Mustafa II, Mohammed IV's son, who resumed leadership in the field of war.

Chios was recaptured and the war with Austria continued. The Turks conquered Lippa and defeated the Austrians and the Austrian field-marshal Friedrich von Veterani was killed. But the Russians took Azov and in 1697 the Austrians under Prince Eugene defeated the Turks at Zenta on the Tisa (Tisza). The war was ended, on the pressure of Venice, Holland and England, by a series of treaties with Austria, Poland and Venice concluded at Karlowitz (Jan. 1699). By the terms of these treaties Turkey retained the Banat; Austria kept Transylvania; Poland restored the places captured in Moldavia but retained Kamenets, Podolia and Ukraine; Venice retained the Morea and Dalmatia and a two years' truce was signed with Russia. In 1700 Azov was ceded to Russia by a separate treaty During this time Husein, another Kuprili, was grand vizier, but his efforts to introduce order into the country were frustrated. He was driven out of office and a fresh revolt of the janissaries forced the sultan himself to abdicate. He was succeeded by his brother Ahmed III.

Ahmed III (1703–30).—Ahmed began his reign by conceding the demands of the janissaries and accepting their chosen grand vizier. Charles XII of Sweden, having been beaten by the Russians at Poltava, took refuge in Turkey and was invited to reside at Bender. This involved Turkey in another war with Russia, which had already sent troops across the frontiers in pursuit of Charles XII (1710). Baltaji Mohammed, grand vizier in command of the Turkish army, was induced by diplomacy to grant the tsar Peter a peace less to Russia's disadvantage than his army's defeat on the Pruth merited (1711). By this peace Azov was left to Turkey, Russian fortresses on Turkish frontiers were razed, Russia consented to the return home of Charles XII and renounced all claims over the Tatars in Crimea and in Polish territory. Because the hospodars of Moldavia and Walachia had assisted Russia during the campaign they were punished, and Phanar Greek notables (*see* PHANARIOTES) governed these principalities till the Greek insurrection of 1821. Venice was next to be punished for having incited the Montenegrins to revolt, invaded Bosnia and captured Turkish ships in the Mediterranean. In 1715 Turkey declared war against Venice, quelled the Montenegrin revolt, captured Modon and Coron and with its fleet took the islands of Tinos and Cerigo, as well as the remaining Venetian fortresses in Crete. Austria intervened, urging Turkey to cede to Venice certain places in Dalmatia as compensation for its losses in Morea. This led to a declaration of war against Austria in 1716. The Turkish army was routed near Petrovaradin and pursued by the Austrian army led by Prince Eugene, which took Belgrade and overran the Banat (1717) The Turkish army then retreated to Adrianople By the mediation of England and Holland the treaty of Passarowitz was signed on July 21, 1718· Belgrade, a part of Walachia and Banat passed to Austria, and strongholds in Albania and Dalmatia to Venice. This treaty was signed by the grand vizier Ibrahim Pasha, who is accused of having betrayed Turkey by accepting it. The craze of the time in the capital was the cultivation of tulip gardens and has given to this period of Turkish history the name of the "tulip period." It created a definite literary school under Nedim, the greatest Turkish lyric poet. But popular murmurings against these costly pleasures became such that the grand vizier had to seize the occasion of the Persian defeat by the Afghans to annex several parts of Daghistan in Persia in order to appease the bellicose spirit of the janissaries. This led to a complication with Russia, but the intervention of France resulted in the treaty of Constantinople between Russia and Turkey (June 30, 1724) which allotted Baku and Derbend on the Caspian coast to Russia.

The news of the defeat of the Turkish army by the Persian army under Nadir Kuli Khan led to a rising of the mob under the leadership of Patrona Khalil, a bath waiter. The grand vizier was killed and the sultan forced to abdicate (1730) His nephew, Mahmud I, Mustafa II's son, succeeded. This was the only Turkish rising which did not originate in the army. The printing press first came into use in Turkey at this time.

Mahmud I (1730–54).—Patrona Khalil was killed and his followers dispersed after the accession of Mahmud I. The war continued with Persia, and Nadir Kuli Khan, after his successes in Iraq and Erivan, seized the Persian throne. In 1736 a Turco-Persian treaty was signed whereby all territory conquered since the reign of Murad IV was returned to Persia. Russia also returned the Persian territory it had annexed, thus laying the basis of a Russo-Persian alliance against Turkey.

The question of the Polish succession once more led Turkey into war France had put forward as its claimant to the Polish throne Stanislas Leszczynski, while Austria and Russia supported the claims of Augustus III (the elector Frederick Augustus II of Saxony) although Russia had bound itself by the treaties of 1711 and 1720 to abstain from interfering with Poland. The Russian candidate was forced upon Poland (1733), whereupon France declared war on Russia and Austria and then urged Turkey to join it. Turkey had a grievance in that Russia had refused to allow the Crimean troops to march through Daghistan during the Persian campaign, so Turkey declared war in spite of the joint efforts of England and Holland. Before waiting for a declaration of war a Russian army under Marshal B C. Münnich stormed the isthmus of Crimea, devastated the peninsula and captured Azov and Kilburun in 1736 and Ochakov the next year. The sea powers of the west mediated to restore peace and the representatives of the belligerents met in Niemirow in 1737 to arrange terms. Austria, however, put forward new claims to the principalities and the Balkan peninsula which were refused by Turkey, whereupon Austria revealed the existence of a secret alliance with Russia and threatened to fight for its new claims. Accordingly Austria's army marched on Bosnia and Walachia, capturing Nish in Serbia. But the tide of war turned against both Russia and Austria when Ochakov and Kilburun were recaptured by one Turkish army while another crossed the Danube and penetrated as far as the Banat. In 1739 Turkey consented to negotiate peace and a conference opened in the camp of the grand vizier who was marching on Belgrade. The preliminaries were signed under the mediation of the French ambassador, Louis Sauveur Renaud, marquis de Villeneuve, for whose services the Porte reaffirmed the capitulations which France had already obtained After the entrance of the grand vizier into Belgrade the definitive treaties of peace were concluded with Austria and Russia (Sept. 18, 1739). Austria gave up Belgrade and the rest of the territory south of the Save which it had gained by the treaty of Passarowitz The treaty with Russia provided that the forts of Azov should be razed and that Russia should have no warships on the Sea of Azov or on the Black sea. The Kabardias were to remain independent as a buffer state between Turkey and Russia. Turkey consented to discuss the question of recognizing the tsar's claim to the imperial title of padishah and admitted his right to send representatives to Constantinople

Two years after the treaty of Belgrade, war broke out with Persia because of Nadir Kuli Khan's attempt on Mesopotamia. It continued from 1743 to 1746 with varying fortunes, and when peace was signed Turkey retained the frontier fixed at the time of Murad IV and Persia procured a few privileges for its pilgrims to the Holy Places. Turkey refrained from taking part in the War of Austrian Succession in spite of the efforts of France, and maintained a peaceful attitude during the disorders which followed the death of Nadir Kuli Khan in Persia The sultan died in 1754 and was succeeded by his brother Osman III (1754–57). The only noteworthy events of the latter's reign were the first Wahhabi rising and the issuing of the first order for veiling women's faces.

Mustafa III (1757–73).—Koja Raghib, the grand vizier at the accession of Ahmed III's son, Mustafa III, sent an envoy to Berlin, and a treaty of friendship and commerce was signed on March 12, 1761. While he was alive Koja Raghib kept the sultan out of war. He controlled Turkey's foreign affairs while the sultan, who was of a fanatical disposition, concerned himself with the dresses and the veils of women. He projected an alliance between Turkey and France; but since France and England had differences over the Indian possessions such a treaty might have affected the English interests among the Moslems, and in consequence Sir James Porter, the British ambassador in Istanbul, used his influence against it.

Before long, events in Poland drew Turkey into war in 1768. Catherine II of Russia tried to put her favourite, Stanislas Poniatowski, on the Polish throne on the death of Augustus III.

The Poles complained to the Porte and urged Turkey to fight Russia. The sultan at first contented himself with protests, but Russia had violated the neutrality of the Kabardia, while in Serbia, Moldavia and Montenegro the Russian monks carned on seditious propaganda against Turkey. Turkey issued an ultimatum to Russia demanding that Russia withdraw its army from Poland On Russia's refusal war was declared. Turkey procured the neutrality of England, Holland and Sweden in this war, and Austria undertook to remain neutral in return for certain privileges Nevertheless Turkey had entered the war without preparations The Turks were first defeated by the Russian forces in Georgia, Crimea and Kabardia and on the Dniester; the Russian Baltic fleet under Alexis Grigorievich Orlov reached Morea, and incited the inhabitants to revolt In 1770 the Turkish fleet was burned near Cheshme (Cesme, west of Smyrna) by the Russian fleet under the direction of a Scottish admiral. The Turks were defeated in Bessarabia, and the Russians invaded the principalities and reduced the fortresses on the delta of the Danube and on the Dniester In 1771 the Crimea was conquered by the Russians. Although the Austrians had undertaken to mediate and to assist the Turks, they preferred to take a share in the partition of Poland After a fruitless conference at Focşani, the Russian representative at the conference of Bucharest (1773) issued an ultimatum demanding the free navigation of the Black sea and the Aegean sea for Russian trading vessels and warships, the cession of Kilburun and the right to protect the Orthodox subjects of the sultan. Turkey refused these terms, and the war continued, the Turks fighting hard in Silistria and Varna. Mustafa died in 1773 and was succeded by his brother, Abd ul-Hamid I.

Abd ul-Hamid I (1774–89).—Abd ul-Hamid had been kept in seclusion for 43 years and was weak in his mind. The abuses and disorders in the army and the palace were at their worst, and the situation at home gave no hope of retrieving the external misfortunes of the state. Turkey refused the mediation of Prussia, but when the Russian army reached Shumla it was forced to negotiate pence. The treaty of Kuchuk Kaynarji was signed on the anniversary of the treaty of Pruth (July 21, 1774) which had been disastrous to Russia This was the most humiliating treaty the Turks had yet signed. The treaty was the first political manifestation of the Eastern Question (q.v.). The Tatars from Poland to the Caspian sea were given their independence, the sultan merely retaining his religious leadership as caliph. Russia retained Kilburun, Kerch and Yenikale, while Akkerman, Ismail, Ochakov and Bessarabia were restored to Turkey. Moldavia and Walachia became semi-independent states under Turkey, Russia, however, having the right to intervene in the appointment and dismissal of the hospodars The imperial title of padishah was definitely conceded to the Russian tsars The Black sea and the Mediterranean were made free for commerce and navigation to both countries, and Turkey was to pay an indemnity of 15,000 purses to Russia The most important clause from the Turkish point of view was that which gave Russia the right to protect the Orthodox subjects of Turkey. Originally this treaty only accorded to Russia the right to build a church in Constantinople and the right of making representations for the protection of the officials of this church, and Turkey undertook to protect the Christians (article 7). This clause was later interpreted as an inclusive protection of the Orthodox Christians and played a disastrous part in the subsequent history of Turkey Poland, the original cause of the war, was not mentioned, having been partitioned for the first time in 1772.

Turkey took advantage of the respite to strengthen its frontier defenses and to reform the janissaries. Russia soon tried to annex Crimea, but a rupture was averted by French mediation and also by the fact that Turkey was not ready for war. Turkey signed the convention of Ainali-Kavak, March 10, 1778, whereby the Russian partisan Shahin Gherai was recognized as the khan of Crimea, and the terms of the treaty of Kaynarji reaffirmed. Five years later Russia annexed Crimea and Kuban, and Turkey was forced to sign the convention of Constantinople on Jan. 8, 1784, the stipulations as to the independence of the Tatars in the treaties of Kaynarji and Ainali-Kavak being abrogated Catherine II's triumphant entry into the Crimea and her interview with her ally the emperor Joseph II to discuss the partition of Turkey, together with the seditious Russian propaganda in Moldavia, Walachia and Morea created a war party in Constantinople which was sustained and encouraged by the British and Prussian ambassadors War was declared. The Austrians joined the Russians but were driven back from Mehadia by the Turks, who overran the Banat (1789). The Russians captured Hotin and Jassy and Ochakov, all of whose inhabitants were massacred, including the women and children, by the order of Gen. Alexander Suvórov. The news affected Abd ul-Hamid I so deeply that he died.

Reform had become so urgent and inevitable that of the two young sultans who succeeded Abd ul-Hamid I, one gave up his life for it and the other had to carry out his designs for westernization by the most sanguinary measures. The ignorance, the despotism or the weakness most of the sultans disorganized both the autonomous and the centrally governed provinces Between the treaty of Karlowitz and the treaty of Kaynarji, the absence of discipline among the *janissaries* and *their interference* in the internal policy of the state upset the administrative machinery The partially self-governed states of Barbary (Tripoli, Tunis, Algiers) had become almost independent, keeping only a nominal connection with the empire and choosing their own chiefs, called *dayi*. The Mamelukes who were allowed to stay in Egypt by Selim the Grim had become stronger and, with the help of the janissaries, were taking up a hostile attitude to the Porte. The pashas in Baghdad did the same. The recurrence of the Jelali insurrections brought forward headstrong governors who ruled the country like feudal lords In European Turkey the locally elected notables, called *ayan*, interfered in the administration This general disorganization had been partially remedied by the grand viziers belonging to the Kuprili family, but it continued worse than ever after them The system of land tenure of the time of Suleiman was violated. The *khas*, *timar* and *ziamet* were seized by the central government, apportioned to the favourites of the sultans or the viziers and sometimes even sold to the highest bidder and to people who were not able to cultivate them or to perform the military duties of the former spahi fief holders. The number of the officials increased, and their short terms of office led to continual disorder.

During the "long war" of the time of Murad III the army increased disproportionately, but its individual units were no longer trained in the barracks and their military value was next to nothing. The sultans isolated themselves in their palaces and led lives of pleasure, thus losing contact with the army. They appointed incompetent commanders and executed them if they were defeated, which paralysed the initiative of those with a genuine ability to command. As the supply of provisions and ammunition was also in disorder, many deserted from hunger and lack of munitions. Although the army decreased in numbers after the treaties of Karlowitz and Passarowitz, the leaders of the janissaries would mark any man in the street as a regular soldier, register his name and put the pay in their own pockets, while the man himself went on with his own work All attempts so far had failed to remedy these abuses To make matters worse, the frequent change of sultans, often brought about by the janissaries themselves, meant accession presents which at times depleted the treasury. Then the treasury was refilled by debasing the coinage

Science and industry which were far advanced at the time of Suleiman had taken no part in the progress of the 17th and 18th centuries but had remained hopelessly mediaeval. The official class was mostly illiterate, and the *kadis* who meted out justice were ignorant The Turks refused to learn any European languages and knew very little of what was going on in the world. When necessity arose they used Christians and Jews as interpreters and became correspondingly dependent on them Few books on philosophy, mathematics and history were printed in Ahmed III's reign. Only literature, especially poetry, flourished during this decadent age, and many of the great Turkish poets were of this time. Textile industries, being patronized by the sultans, also flourished. The manufacture of implements of war and ammunition continued, partly because of the artisans who inherited their craft and partly because of the experts who were brought from

the west for the purpose.

Selim III (1789–1807).—Selim III, the son of Mustafa III, was the only Turkish prince of the last centuries who had not been caged, which gave him an opportunity of greater knowledge and a more normal view of the world. A passionate admirer of French culture, he wanted Turkey to be equal with the western powers in every branch of progress. It was in Selim's mind that the new Turkey originated, and with him the struggle for reform and progress began seriously, at the price of so many Turkish martyrs. He hoped to bring the war to a victorious end and so acquire the necessary prestige for his reforms. When the news of the Russian victory of Kalas reached Constantinople, he called a council, enumerated the causes of defeat and disaster and proposed internal reform as the only remedy. He insisted that the people should elect their own *kethudas* (mayors) and *ayans* (notables) without the interference of the governors, that an end should be put to the unlawful tribute which the *rayas* were made to pay, that the army and the administration should be organized on a western basis.

In the meantime one Austrian army defeated the Turks in Serbia and captured Belgrade, while another in conjunction with the Russian army captured Focşani. On Aug. 4, 1791, the new Holy Roman emperor, Leopold II, who was unfavourable to the Russian alliance, made a peace with Turkey at Sistova through the mediation of England, Prussia and Holland, by which Belgrade was restored to Turkey. But Russia, after defeating the Swedes, who were Turkey's allies with Prussia, was free to carry out its policy of extension in Turkey, and the war continued. It was about this time that William Pitt in England proposed the policy of preserving the integrity of the Turkish empire. It appeared first in the form of friendly advice to Russia to make peace with Turkey, which was rejected by Catherine II. Turkey, after several reverses on the field, made peace with Russia in 1792 at Jassy, the Dniester becoming the Turkish frontier in Europe.

Selim continued his reforms, especially in the army. He formed a new corps, but in order to disarm the jealousy of the janissaries he affiliated the new corps to them. Military schools were opened, the fleet reorganized, and instructors brought from Europe. But his progress was interrupted by the war with France (1798). Bonaparte attacked Egypt, more as a move against England than against Turkey, as his aim was to open a French route to India. Turkey fought against France in alliance with England and Russia. Napoleon was beaten in Syria, the French fleet destroyed by Nelson at Aboukir, and the Ionian islands captured by the Turkish and Russian fleets. Peace was concluded with France in 1802. The reactionary governors whose interests were injured by the new reforms continued to cause disorder in every part of the empire. Pasvanoglu, the governor of Vidin, drove the peaceful *rayas* to revolt by his persecutions, and the insurgents chose Karageorge (George Petrovic) as leader and succeeded in taking Belgrade. An army was sent to punish Pasvanoglu, without result. The revolt of the Wahhabis in Nejd became another source of anxiety which continued till the time of Mahmud II. A marked renewal of trouble broke out with Russia over the principalities. Constantine Ypsilanti and Alexander Murusi, hospodars of Walachia and Moldavia, two instruments of Russia, had caused risings against the Porte which had led Turkey to dismiss them without the consent of Russia, thus violating the agreement of 1802. Russia and England protested, and the two were replaced. But, encouraged by the French ambassador, H. F. B. Sébastiani, Turkey declared war against Russia, although the British ambassador threatened to join Russia against Turkey (Nov 6, 1806). The British fleet passed the straits, anchored off Constantinople and delivered an ultimatum, ordering Turkey to dismiss the French ambassador within 24 hours and to make peace with Russia. The Porte, encouraged by Sébastiani and by popular indignation at the presence of the ships, decided to resist. The entire population of Constantinople helped to range a thousand guns along both sides of the Bosporus in one day. The British fleet retired considerably damaged.

In the meantime the reforms and the progress of the new army were leading the janissaries and the corrupt officials to make desperate efforts in opposition, and they were supported by most of the reactionary governors. In 1807 the garrisons on the Black sea rose, under Kabakjioglu, and killed their officers and all those who were known to be reformists. The rebellion became general and the abolition of the new troops was demanded. The concessions made by the sultan in the hope of preventing further bloodshed only encouraged the rebels to make greater demands, and finally they dethroned him. Sébastiani is charged by the Turkish historians with inciting the janissaries.

Mustafa IV (1807–08).—Selim's successor Mustafa IV, son of Abd ul-Hamid I, abolished all the reforms, and anarchy continued during his reign of 14 months. In 1807, during the negotiations between Tsar Alexander I and Napoleon at Tilsit for the partition of Turkey, Napoleon undertook to mediate peace between Russia and Turkey if Alexander would withdraw his troops from Walachia and Moldavia. An armistice was signed in Aug. 1807, the Turkish army retiring to Adrianople. In the winter of 1807 a committee composed of the adherents of reform in Ruschuk (Russé), persuaded Bairaktar Pasha, who had distinguished himself in the Russian war, to march on Constantinople with an army of 20,000 Kirja-Ali troops with the object of reinstating Selim and his reforms. Selim was killed by the janissaries before Bairaktar's army could enter the palace (1808). His nephew, Mahmud, Mustafa IV's brother, a youth brought up in the tradition of reform, was saved by Jevri Kalfa, a woman in the palace who threw ashes in the eyes of the murderers and enabled the future sultan to escape by the roof. Mustafa IV was dethroned and Mahmud II, the last survivor of his line, ascended the throne.

Mahmud II (1808–39).—Mahmud II appointed Bairaktar grand vizier and issued a royal proclamation ordering him to treat the people and their *rayas* with justice and to re-establish order. As the Russian question was not settled and the principal governors were all trying to instigate revolts by declaring the reforms to be antireligious and thereby exciting fanatical resistance, Mahmud II based his arguments on religious grounds and demonstrated the necessity of education and reform in the name of Islam. Bairaktar Pasha called a council in Constantinople to which he invited notables and influential men from all over the country. The council decided that the new troops, under European instructors, were to be re-established under the name of *seymen-i-jedid*; that the janissary organization was to be retained but reformed, those only nominally on the register and receiving pay without serving to be dismissed, and that the authority of the sultan was to be permanent. The new grand vizier managed to restore comparative order and began his reforms seriously, but while the Kirja-Ali troops who were loyal to him were on their Bairam leave the janissaries attacked his home at night. He pretended to parley with them asking to have his womenfolk removed to a safe place, after which he promised to give himself up. But when the women had been removed he opened fire on the rebels from his windows and fought them to the last shot, after which he blew himself up in the powder magazine under his house. The janissaries, once more masters of the situation, resumed their massacres of the new troops and forced the sultan to cancel all the reforms.

The truce signed with Russia in 1807 had had no result, and the war continued fitfully. France had encouraged the Porte to resume the Russian wars but the misfortunes of these wars aroused public opinion in Turkey against France and turned it in favour of England. On June 5, 1809, a treaty was signed in Chanak between England and Turkey, the British representative being Sir Robert Adair. A peace with Russia was also concluded on May 28, 1812, in Bucharest by the mediation of Stratford Canning, who later as Lord Stratford de Redcliffe, British ambassador, played a great part in Anglo-Turkish friendship. The treaty gave Hotin, Bender and Akkerman to Russia and confined the eastern frontiers of Turkey to the lines of the Prut river. The clause which restored Serbia to Turkish suzerainty was vague and gave rise to disputes. The Turkish army marched into Serbia and appointed one Milosh Obrenovich as the governor of his district; he, however, raised a successful revolt against Turkey and ruled Serbia in semi-independence. Karageorge, who had returned, was killed by him, and in 1817 he was designated hereditary prince of Serbia.

During the war with Persia, Russia had acquired the right from

Turkey to use temporarily the road from the Black sea to Tiflis by way of the valley of the Rion-Phasis. Russia desired to have this district ceded to it by a secret clause in the treaty of Bucharest, and the sultan had refused to ratify it. But within a few years Russia acquired the high land between the Caspian and the Black sea and the low lands along the coast between Anapa and Poti, which were nominally under the suzerainty of the sultan.

Such was the situation when a European guarantee of integrity of Turkey was proposed at the congress of Vienna, in the belief that breakup of the Turkish empire would endanger the world's peace. It was decided, with the consent of the tsar Alexander, that England, France and Austria should trace clearly the frontiers of the Turkish empire, whose integrity the powers would undertake to guarantee. The Porte, deeming the proposal to be a humiliating foreign intervention, refused. The return of Napoleon threw the question into the background and the Turkish empire thus remained outside the European concert. This Eastern Question (*q v*) which occupied the political history of the 19th century can be summed up as the result of the conflict of the following desires: Russia's and Austria's desire to reach the Mediterranean; the British desire to prevent Turkey from obstructing the route to India and the desire of the non-Moslem Turkish subjects for independence, which was often concealed under the demands for reform.

Mohammed (Mehemet) Ali Pasha, the governor of Egypt, who had become known during the war with Napoleon, had proved his strength in 1811 by destroying the Mamelukes. His successful expedition against the Wahhabis in Hejaz had made him a popular hero as the saviour of the holy places. Another Ali Pasha of Janina (*see* ALI, known as ALI PASHA), originally from Tepeleni, who kept order for a time in Greece and Albania, but who became rebellious, was slain in 1822.

The Greek Rising.—The Greeks found this an opportune moment to realize their ideal of national independence. Their hopes had begun at the time of Peter the Great and were considerably strengthened by the attitude of Catherine II (*see* GREEK INDEPENDENCE, WAR OF). Their secret revolutionary society, the Hetairia, was founded in Bucharest by the Greek poet and patriot, Constantine Rhigas; and, four years after his arrest and execution in 1798, it was revived in Odessa. The society passed into action with the help of Alexander Ypsilanti, son of hospodar Ypsilanti, a Greek who had become a general in the Russian army and used his forces to support insurgents in Moldavia in 1821. The emperor Alexander's aversion to supporting a revolutionary, even against the infidel Turks, together with the preference of the population of the Danubian principalities for the Turkish rule rather than that of the hated Phanariotes, considerably weakened the cause of the insurgents. This, the first serious rising was put down at the battle of Dragashani on June 19, 1821. The Greek rebels in Morea, however, had massacred almost to extermination the native Moslems and the sultan retaliated by executing the Greek patriarch in Constantinople on the charge of having instigated the slaughter. Russia, taking this up as an insult to the Orthodox Church, broke off relations with Turkey. The European powers used every effort to avert a Russo-Turkish conflict. Metternich hoped that with time and the moral and material assistance of European peoples the Greeks would of themselves achieve national independence. On March 25, 1823, however, George Canning induced England to recognize the Greek insurgents as a belligerent party. The Russian emperor, jealous of this new influence in favour of the Orthodox Christians of the east, called as a counterpoise a conference in St. Petersburg in April 1824. Neither the Turks nor the Greeks would abide by its decisions and the sole outcome of the conference was an offer of the joint mediation of Austria and Russia, which the Porte refused. The sultan, finding himself unable to put down the Greek revolt, asked the aid of Mohammed Ali Pasha, the governor of Egypt, promising him the general governorships of Morea, Syria and Damascus in return. The well-disciplined Egyptian fleet and army approached the Morea under the command of Ibrahim Pasha, the son of Mohammed Ali. The Greeks were defeated in June 1827, Athens once more was in the hands of the Turks, and Ibrahim Pasha was sending crowds of Greeks as captives to Egypt and replacing them by the fellahin (Egyptian peasants). An isolated Russian intervention, for which Russia was concentrating in the south, was prevented by the death of the tsar Alexander in 1825. Canning persuaded the new tsar Nicholas I to call another conference in St. Petersburg on April 4, 1826, as a result of which England was empowered to offer Turkey a settlement of the Greek question based on the establishment of Greece as a vassal and tributary state. In case of refusal the two powers, whether separately or in common, would take the earliest opportunity of enforcing a settlement. Russia, meanwhile, issued a separate ultimatum to the Porte for the satisfaction of its other grievances. The Porte, though it resented new demands being made before the others were dealt with, was unable to resist and signed the convention of Akkerman accepting the Russian demands which were the confirmation of the treaty of Bucharest; the opening of the navigation of the Black sea to Russian ships; seven years' term of office for the hospodars of Walachia and Moldavia, as well as the consent of the Russian ambassador in Constantinople before they could be dismissed and the recognition of the autonomy of Walachia and Moldavia, where no Moslem was to reside except in the fortresses.

Mahmud II, by a wholesale massacre on June 15, 1826, had crushed the janissaries, and the defense of the empire was now in the hands of the new army. Helmuth von Moltke was to be among the large number of French and Prussian instructors engaged for it. Mahmud also abolished what remained of the feudal system in the provinces. The taxes were to be gathered by the central government. The execution of individuals by the viziers without trial and the confiscation of the property of wealthy persons deceased, or of persons executed by the state, was forbidden by new regulations. Mahmud II himself discarded the turban and adopted the fez and European costume, and ordered all officials to do the same. The fez remained the official headgear of the Turks till the passing of the "hat law" by the Turkish republic in 1925.

The Greek question was still unsettled. In 1826, the Greeks formally asked for the mediation of England. Canning's objection to intervening unasked having thus been removed, he invited the co-operation of Russia in making representations to the Porte which should be based on the protocol of St. Petersburg and suggested measures of coercion in case of refusal; the tsar consented to this. The coercion was to take the form of a pacific blockade of Morea, so as to force Ibrahim Pasha to evacuate the country by cutting off his supplies. Austria and Prussia, in the conference of the five powers of the Grand Alliance in London in 1827, protested against coercion of the Porte for revolutionary purposes and withdrew. On the suggestion of France, however, the protocol was made into a treaty and, as the treaty of London, was signed by the three powers on July 6, 1827. By its public articles the powers agreed to secure the autonomy of Greece under the suzerainty of the sultan without any breach of friendly relations with Turkey. But by additional secret articles it was agreed that in the event of the Porte's not accepting the offered mediation, consuls should be established in Greece and an armistice proposed to both belligerents and enforced by the powers.

The armistice, accepted by the Greeks, was refused by Ibrahim Pasha, pending instructions from Constantinople, though he consented to keep his ships in the harbour of Navarino. In the meantime the Greeks destroyed a Turkish flotilla off Salona, and Ibrahim, taking this as a breach of the convention, set sail from Navarino northward. The Russian and French fleets joined the British fleet at Navarino and, on Oct. 20, attacked the Turkish and Egyptian fleets and destroyed them (*see* NAVARINO, BATTLE OF). Turkey broke off diplomatic relations with the three powers concerned, and the sultan issued a proclamation denouncing the cruelty and perfidy of the European powers and summoning the Moslems to a holy war. Canning had died and England had gone back to its policy of preserving Ottoman integrity, so the struggle that followed was restricted to Russia and Turkey. Russia declared war on Turkey April 26, 1828, England disapproving and France agreeing. Although Turkey was in the midst of confusion because of the destruction of the janissaries and the new army

was small and hardly formed, the resisting power of the Turks was raised to its utmost by the attitude of the powers. Russia had to fight two very hard and difficult campaigns before Gen H. von Diebitsch could dictate terms of peace at Adrianople (Sept. 14, 1829). A protocol at London on March 22 had proposed boundaries for an autonomous Greece. The treaty of Adrianople between Turkey and Russia provided that the Danubian principalities were to become practically independent; that the districts of Anapa and Poti were to be ceded to Russia; and the Greek question was to be settled according to the terms of the protocol of March 22 But in order that Russia should not enjoy the prestige of having emancipated Greece unaided, the other powers decided to give further concessions to Greece, and this was expanded into the treaty of London of May 7, 1832, by which Greece became an independent kingdom under the Bavarian prince Otto (*see* RUSSO-TURKISH WARS; GREECE: *History*).

The Egyptian Revolt.—Turkey suffered a series of serious internal revolts after the reverses had reduced her prestige. Bosnia and Albania revolted. In 1830 the French occupied Algiers Mohammed Ali Pasha, the governor of Egypt, was found to have intrigued in the revolt of Albania and in Damascus. He was recalled and replied by open revolt, sending his army under his son Ibrahim Pasha to invade Syria Mohammed Ali Pasha's hope was to seize the sultanate and to start a new dynasty—a hope which seemed feasible when, after capturing Damascus and Aleppo and defeating the Turkish army in Konya, Ibrahim invaded Kutahia. As France was supporting Egypt, Turkey endeavoured to draw England into an alliance against Egypt. Palmerston refused in spite of the efforts of Stratford Canning, and Mahmud II in desperation asked for help from Russia. The treaty of Unkiar Skelessi (Hunkiar Iskelesi) was signed July 8, 1833, and the Russian army came to the Bosporus to help the Turks against the Egyptian army which was now threatening to march on the capital. England and France, suspicious of Russia, now mediated. They forced Mohammed Ali to stop the march of the Egyptian army and made the sultan accord the hereditary governorships of Adana, Crete, Tripoli and Damascus to him This put a temporary end to the war. The treaty of Unkiar Skelessi had included clauses to which permitted: (1) Russian warships to pass through the straits and to land troops if necessary and (2) the closing of the straits to warships of all the other powers. These clauses seemed to place Turkey in the power of Russia. After securing peace under these humiliating conditions Mahmud once more began to prepare his army while Mohammed Ali increased his with recruits from the provinces which had been given him. In 1839 Mahmud sent a Turkish army against the Egyptians in Syria but was badly beaten by the forces of Ibrahim Pasha at Nezib in the north of Syria. Mahmud died in Constantinople while the battle was actually in progress (July 1, 1839).

Internal Affairs.—Mahmud II's reign opened seriously the period of westernization in Turkey. In addition to the army reforms already mentioned, medical schools were opened by experts from Europe, and the civil service was organized on a modern basis. A number of students were sent to Europe for the first time, a newspaper and the first official printing press were established. The ministry of foreign affairs and the ministry of the interior were organized as well as the ministry of public works and the supreme council of legal affairs. The naval and military schools and the school of engineering founded by Selim III were reorganized, and in 1838 a council of public instruction was formed. The basis of compulsory elementary education was laid down by a royal proclamation which forbade children who had had no elementary education to take up any craft And the pious foundations (*evkaf*) were unified and organized into a ministry.

Abd ul-Mejid I (1839–61).—Abd ul-Mejid succeeded his father at the age of 16 when Mohammed Ali Pasha of Egypt seemed on the verge of seizing Turkey and the empire seemed about to dissolve into its elements. The army, the government and the sultan were helpless and the Turkish fleet was handed over to Mohammed Ali Pasha by the treachery of Adm. Ahmed Pasha. But to prevent Russia from using the treaty of Unkiar Skelessi for its own purposes the great powers decided to intervene in the Turko-Egyptian conflict and called a conference in London. France, who had supported Mohammed Ali Pasha, took no part in the final settlement, but Russia for the purpose of breaking the entente between England and France waived its claims under the treaty of Unkiar Skelessi and joined the concert. By the *protocol de clôture*, which was signed on July 15, 1840, the governorship of Egypt became hereditary in Mohammed Ali's family without undermining the sovereign rights of Turkey, Egyptian claims to Crete, Syria and the Holy Cities were abandoned. A year later, on July 15, 1841, five powers signed the *protocol des détroits*, by which the sultan was to close the straits to warships of all the powers.

The schemes for reform which Selim III and Mahmud II had only been able partially to realize were to be more fully worked out under Abd ul-Mejid I. Mustafa Reshid, the Turkish foreign minister and ambassador to London, returned. He was the greatest statesman and westernizer of the reform period, and he personally prepared a *tanzimat* or vast plan of reforms and made the sultan sign and issue it under the name of *Gulhane-hatti-humayoumi* (royal decree of Gulhane). From this decree dates the fundamental change of Turkey from the old system based on nomadic principles to that of a modern state Like the preceding decrees, in order that it might disarm fanatical opinion, it also emphasized that all progress was in accordance with Islam It undertook to issue laws conforming with the age, to establish security of life, property and honour (no one was to be punished without trial); to remodel every branch of the administration and to accord perfect equality to all Ottoman subjects of whatever race or creed. This meant a great difference for the Christians. Though they had religious and communal freedom by the firman of the conqueror, the political complications caused by the separatist tendencies and the massacre of the Moslems in Morea by the Greeks had aroused intense hatred and made their position difficult and even dangerous. The attempt of the *tanzimat* to establish them as equal citizens helped to unite them with the ruling race and before long the Christians shared all the offices in the administration, even up to the rank of cabinet minister. Mustafa Reshid with a few convinced and westernized men around him made gigantic efforts to enforce the new principles in every department. The announcement of reforms, however, regularly ran far ahead of their performance.

Mahmud's military organization was extended by engaging more foreign instructors and opening more military schools The most important change was the recruiting law, which reduced military service, hitherto for an indefinite time, to a limited period. The Christians were exempted from military service upon payment of a special tax. A body of gendarmerie was instituted.

In addition to the only existing educational institutions, that of the ulema and the schools maintained by private donations, with studies based on the Koran, the council of education founded and multiplied both primary and secondary state schools, and tried to unify and centralize education by sending superintendents to the provinces to carry out the state system. Commercial courts were opened As the civil and penal cases were sent to the Sheria courts, a school for judges was opened and attached to the office of the sheikh ul-Islam.

Permanent ambassadors were appointed from among the best statesmen and sent to European capitals; this helped to create friendly relationships with the western powers. The promise of the reforms, which without resorting to terrorist methods appeared to be forming a centralized and efficient government, naturally aroused great sympathy for Turkey and hope for its future. The only international controversy arose when in 1848–49 Turkey, true to its traditions, refused to give up the Polish and Hungarian refugees. Turkey had England's support in this act. The difference with Persia over the frontier question was settled for the time being by the treaty of Erzurum (1848) by English and Russian mediation.

The Holy Places and the Crimean War.—The possibility of a strong and reformed Turkey made Russia uneasy. Since the time of Peter the Great and Catherine II it had considered itself the rightful heir to most of the lands of the declining Turkish state. Nicholas I, who went to London in 1844, proposed to England the

partition of Turkey, which he called a "sick man." England was to receive Crete and Egypt, Constantinople was to be a free city, and the Balkan states were to be autonomous under Russia. Suspicious of the Russian designs, England refused to solve the Eastern Question by so drastic a measure But the question came up again in 1850 through a quarrel between the Catholic and Orthodox monks about the Holy Places in Palestine.

The capitulations signed on May 28, 1740, by Mahmud I, according certain rights to the Roman Catholic (Latin) ecclesiastics in the Holy Places, had placed the French pilgrims, together with the pilgrims of the other Catholic nations, under the protection of the French flag. This stipulation of the treaty had fallen into desuetude during the French Revolution. In the meantime every advance of Russia had been marked by encroachments of the Orthodox Church on the Roman Catholic Church. The quarrels of the monks of the two churches would have passed unnoticed if Louis Napoleon had not in 1850 seized the opportunity to win over to his side the clericals in France: the French ambassador handed to the Porte a formal demand for the restitution to the Catholics of all their rights The Ottoman government proposed a mixed commission of inquiry, and France agreed with the condition that no documents later than 1740 should be admitted as evidence As this suggestion excluded the treaty of Kaynarji, the tsar demanded that nothing should be altered in the *status quo*. This was a contest between Russia and France for paramount influence in the east: England was inevitably involved and took the side of France and Turkey. The Porte arrived at a compromise in March 1852 by issuing a firman which accorded privileges to both sides, taking on itself the right of "protection." Neither France nor Russia accepted this as neither desired a settlement. Louis Napoleon, who became emperor as Napoleon III in Nov 1852 and whose new title had been recognized only equivocally by the tsar, wanted a war for dynastic reasons, and the tsar thought the moment opportune to drive out the infidel from Europe. The tsar renewed the proposals of partition made in 1844.

In 1853 Prince Alexander Sergeievich Menshikov was sent to present the Russian ultimatum to Constantinople. He demanded the recognition of the *status quo* in the matter of the Holy Places and of the tsar's right under the treaty of Kaynarji to protect the Orthodox subjects The Porte turned for advice to Lord Stratford de Redcliffe, the British ambassador, who was both popular and influential. He grasped the situation at once and persuaded Menshikov to present the two demands separately. On April 22, the question of the Holy Places was settled by the British, Russian and French ambassadors. Then when the question of the Russian protectorate over the Christians was raised, Menshikov found himself opposed by the ambassadors of the other powers. Menshikov demanded that the Porte should give a note reaffirming the Russian rights, and this the Turkish cabinet seemed inclined to accept. But that cabinet fell; Mustafa Reshid came into power and, advised by Lord Stratford de Redcliffe, refused the Russian demand. Menshikov left Constantinople on May 22. On June 22 the Russian army under Prince Mikhail Dmitrievich Gorchakov entered the Danubian principalities. It was explained, however, by a circular that this was not with the purpose of attacking Turkey but in order to obtain material guarantees for the enforcement of the existing treaties. In August a conference of the four powers assembled in Vienna, but the settlement proposed conceded everything to Russia except the protectorate, and the Porte would not agree to it. In October Turkey presented an ultimatum to Russia demanding the evacuation of the principalities, and the French and English fleets passed the Dardanelles. Lord Aberdeen, hoping to keep peace, informed Russia that as long as it abstained from crossing the Danube or attacking a Black sea port there would be no *casus belli*. But Russia bombarded Sinop on the Black sea coast and destroyed a Turkish squadron (Nov. 30), and the French and English fleets entered the Black sea and demanded that the Russian fleet should retire.

The conflict at Sinop had been more like a slaughter than a battle, and the excellent behaviour and initial successes of the Turkish land forces aroused sympathy and admiration throughout Europe. The belief in the rejuvenation of Turkey seemed justified. On March 27, 1854, Great Britain and France declared war on Russia, with the strong support of public opinion; they were later joined by Sardinia. Austria put pressure on Russia to withdraw from the Danubian principalities and occupied them itself in agreement with Turkey (*See* EASTERN QUESTION)

The main operations of the Crimean War (*q.v.*) were confined to the Crimea. The allied troops landed on Sept. 14, 1854, and the campaign lasted till Dec. 1855, when the threatened intervention of Austria forced Russia to accept terms which were ultimately embodied in the treaty of Paris (March 30, 1856). Russia abandoned its pretensions to protect the Christians in Turkey and renounced her right of exclusive interference in the Danubian principalities, to which a fragment of Bessarabia was restored, the navigation of the Danube became free under the supervision of an international commission; the Black sea was to be open to commercial ships of all countries and closed to all warships except a limited number of small warships belonging to Turkey and Russia; Turkey was admitted to the European concert and the contracting parties were to respect its independence and the integrity of its territory; the *tanzimat* was reaffirmed and enlarged by a decree of the sultan called the *Hatt-i Humayun*, which was included in the treaty under insistence from the powers.

The new era following the Paris conference opened with several outbursts against the reforms It is noteworthy that the Christians, even the clerical class, were opposed, either for fanatical reasons or at the instigation of Russia, which did not want Turkey to be strengthened. In 1859 the Danubian principalities, encouraged by France and Russia, united and, choosing Alexander John Cuza as their ruler, formed the principality of Rumania. (*See* RUMANIA.) In 1860 a disturbance in Lebanon involving the Druses and the Christians led to a French occupation, which Fuad Pasha, seconded by Ahmed Vefik Effendi, the Turkish ambassador in Paris, contrived to restrict and to terminate as soon as possible. A *réglement* was signed in Constantinople on June 9, 1861, instituting an autonomy for Lebanon under a Christian governor to be chosen by the powers with the consent of the Porte. This agreement lasted till World War I.

Toward the end of Abd ul-Mejid's reign a secret committee was formed in Constantinople to propagate the idea of a constitutional regime for Turkey.

Abd ul-Aziz (1861–76).—Abd ul-Aziz became sultan on his brother Abd ul-Mejid's death in 1861 and reaffirmed by decree the principles of the *tanzimat*. Pan-Slavism, which had its centre in the University of Moscow, began to penetrate Montenegro and Hercegovina, which rose in revolt. These revolts were put down but the Serbs also revolted, demanding the expulsion of the Moslems who lived in the fortresses. In 1862 this revolt was pacified by ceding a few more fortresses to the Serbs; and five years later, through the mediation of England and Holland, the Turkish troops were withdrawn altogether. The Cretans, aided by Greece, revolted and declared their union with Greece. Thereupon Ali Pasha, the grand vizier, went to Crete with an army and quelled the revolt; the episode led to a diplomatic rupture with Greece and in 1869 a conference of ambassadors in Paris accorded local autonomy to Crete under Christian governors. Meanwhile, Ismail Pasha, who became governor of Egypt in 1863 and was a man given to unrestrained expenditure, had obtained loans from France and England, bribed a large number of influential men in the Porte and made the sultan agree to the establishment in Egypt of a succession from father to son, which he did by issuing the firman of May 27, 1866, and June 8, 1867, the latter according to the governor of Egypt the title of khedive. Abd ul-Aziz yielded so easily because he was desirous of bringing about the same alteration in the succession in Turkey in favour of his eldest son. Also, the introduction of a regular budget system for the first time revealed the deplorable state of the treasury. New loans, internal and external, had to be raised in order to pay the interest on the old debts.

The regime of Midhat Pasha, the father of the Turkish constitution, as the governor of Nish, was so popular with all races and creeds that his methods were introduced into other Rumelian vilayets. The people elected their provincial councils, and criminal and civil courts were first opened in those provinces. On March 10,

1870, a firman instituted the Bulgarian exarchate, thus severing the Bulgarian Church from the jurisdiction of the Greek patriarch of Constantinople. In 1871, Russia, taking advantage of the weakened state of France, declared itself no longer bound by the treaty of Paris, which had restricted the number of Russia's warships on the Black sea An international conference which met in London in 1871 recognized this by abrogating the restrictions on both Russia and Turkey. The passage of the straits remained interdicted to warships.

A law promulgated on June 18, 1867, for the first time allowed foreigners to hold landed property throughout the empire except in Hejaz on condition of their being divested of their right to the protection of their own authorities concerning such property The grand vizier, Ali Pasha, also made the first amendment to the capitulations by inducing the powers to accept Turkish jurisdiction over small cases for their subjects who lived at a distance from consular towns. In 1866 a Bulgarian insurrection, instigated by Russia, broke out in Trnovo on the pretext that the reforms promised by the firman quoted in the treaty of Paris had not been carried out. Although Midhat Pasha pacified the rising, its real motive, which was nothing less than a desire for national independence, remained unaltered After the death of such able statesmen as Ali Pasha and Fuad Pasha, Abd ul-Aziz became despotic and began to exile people without trial The palace expenses increased and financial conditions became worse. The world-wide depression which began in 1873 ended the process of borrowing to cover extravagance and meet deficits Recourse was had to increased pressure for taxes, which were still payable in kind. Mahmud Nedim Pasha was obliged to declare that the government could pay only a 50% annuity on its debts; whereupon Europe considered Turkey bankrupt, and the state began to lose the prestige gained after the reforms. The agrarian conflict between the Mosiem landowners and the Christian peasantry in Hercegovina now spread to the Serbs and Bulgars. A revolt of the latter people was punished with traditional Turkish severity. The Bulgarian atrocities committed by the Turks in the summer of 1876 turned public opinion in the west against Turkey still more.

A secret revolutionary society, formed at the time of Ali Pasha and called the Young Ottomans, was spreading its ideas and influencing public opinion. The great Turkish poet and patriot Namik Kemal Bey and another poet and satirist, Zia Pasha, fled to Paris and published pamphlets inciting the people to demand a constitutional government and succeeded in smuggling them into every part of Turkey. Midhat Pasha, who shared the opinions of the Young Ottomans, succeeded in winning over other members of the cabinet for constitutional change and obtained a *fetva* for the deposition of Abd ul-Aziz, who was accordingly dethroned on May 30, 1876, with the purpose of establishing a constitutional regime. A few days after his deposition he committed suicide. His nephew Murad V, Abd ul-Mejid's son, who ascended the throne, became insane after reigning three months and was deposed. Murad's brother Abd ul-Hamid, believed to be liberal, but actually reactionary, was placed upon the throne (Aug. 31).

Abd ul-Hamid II (1876–1909).—In the autumn of 1876 Russia made preparations looking toward war with Turkey. With the hope of settling peacefully the Bosnian, Serbian and Bulgarian questions, the British government of Disraeli took the initiative in calling a conference at Constantinople After assembling on Dec. 12, the conference appeared to be making progress, proposing that the Bosnian and Bulgarian areas should be given substantial autonomy under a governor-general named by the sultan and approved by the powers. But on Dec. 23 the sultan proclaimed a constitution, mainly modelled on the French system, which had been prepared by Midhat Pasha. The defeated conference dragged on for four weeks and then disbanded. Two weeks later, on Feb. 5, 1877, the sultan dismissed and banished Midhat Pasha. Russia in exasperation declared war on Turkey on April 24. The Rumanians joined Russia and Austria declared its neutrality. Public opinion in Europe was anti-Turkish, especially in England, because of the financial repudiation and the sanguinary repression of the Bulgarian revolt, and not a single voice was raised in favour of Turkey. The Turks were defeated both in Europe and in Anatolia (*see* Russo-Turkish Wars), and the Russian army reached Adrianople where both a truce and the preliminaries of peace were signed on Jan. 31, 1878. A treaty was concluded in San Stefano on March 3, 1878. Rumania and Serbia were to become independent, while Bulgaria was to become a vast principality, its frontiers reaching both to the Mediterranean and the Black sea The provinces of Kars, Ardahan and Bayazid were to be given to Russia as a war indemnity. England objected to the treaty as violating the terms of the international treaty signed in Paris and proposed a new congress. At first only Germany, France and Italy agreed, but when Austria, which was in a position to endanger the retreat of the Russian army, came in, Russia was obliged to do likewise. Turkey contracted a defensive alliance with England on June 4, 1878 at the price of leasing to that country the island of Cyprus.

On July 13, 1878, the congress of Berlin (*q.v.*) ended the Russo-Turkish conflict. It modified the treaty of San Stefano; recognized the independence of Rumania, Serbia and Montenegro; reduced the frontiers given by the treaty of San Stefano to Bulgaria and further divided the territory into two parts, one of which became a self-governing Turkish province named Eastern Rumelia. Turkey had the sanjak of Bayazid in Anatolia restored but was to pay an indemnity of 300,000,000 roubles to Russia. The most important clause of the treaty was the formal engagement of Turkey to introduce reforms in the Rumelian provinces as well as in the eastern provinces which had Armenian minorities.

Abd ul-Hamid II, who immediately after the congress engaged a number of European experts on the pretext of reorganization and reform, before long dismissed them. Apart from the occupation of Egypt by England (1881), (*see* Egypt), the chief interest of Turkish history now lies in the steps by which Abd ul-Hamid secured his predominance The power of the Porte was slowly transferred to the palace through the machinations of Said Pasha, the first secretary of Abd ul-Hamid, who before long was an absolute monarch. Midhat Pasha, the veteran reformer, was lured back by a free pardon and appointed governor of Smyrna. Before long he was arrested, charged with the death of Abd ul-Aziz, condemned, reprieved, exiled and finally executed in prison. Since the finances had become worse after the war and the payment of debts was falling into arrears, Said Pasha, now grand vizier, founded the Ottoman Public Debt administration which gave the control of the payment of debts to European delegates. By the decree of Muharrem, Dec 1881, several categories of Turkish revenue were assigned to this administration, which exercised a weighty influence in Turkish finance until 1914.

In 1885 a rising took place in the province of Eastern Rumelia, which was united to Bulgaria Turkey appointed Prince Alexander of Battenberg (the prince of Bulgaria) governor of Eastern Rumelia, a diplomatic way of accepting the annexation. Revolts in Crete had been in progress since 1890, and Greece hoped to annex the island. The series of independent non-Moslem governments which had been founded in succession within the empire raised the hopes of all the other national minorities. The Armenians in the eastern vilayets, who enjoyed freedom of education in their schools, succeeded in permeating all the Armenian communities with the desire for national independence. Two revolutionary Armenian committees, called Hinchak and Dashnaktsutiun, who were in close touch with European centres, were formed. Abd ul-Hamid's foolish patronage of the Kurdish communities encouraged them to persecute the Armenians. This, as well as the severity with which the taxes were collected, gave the Armenians two pretexts to rise in revolt in 1894. These revolts were repressed with such sanguinary measures that England and France prepared a program of reforms for the eastern vilayets and forced Turkey to accept it. No effect was given to the Turkish promises, and in 1896, when Lord Salisbury tried to enforce reform on those vilayets, the other powers would not agree to the coercion of Turkey. The Armenian revolutionaries in despair adopted a form of revolt which would force the attention of European political circles: they seized the Ottoman bank, a European institution in Istanbul The repression was once more sanguinary.

On the ground that Greece had inspired the revolts in Crete, the

Porte declared war on April 17, 1897, and the Turkish army, after inflicting a severe defeat on the Greeks, marched on Domokos. The powers, becoming anxious, intervened and ended the war. A peace was concluded which involved a slight rectification of the frontier and the payment of an indemnity of £T4,000,000 by Greece. Crete was put under international control, *en dépôt*, and much of the capitulations which benefited Greek citizens was cancelled. In 1898 Prince George, the son of the king of Greece, was appointed governor of Crete and a national assembly called. The refusal of Austria and Germany to take part in the anti-Turkish settlement of the Cretan question emphasized a new attitude of Germany toward Turkey. As a result of its apparent pro-Turkish policy Germany obtained a concession to construct the Anatolian railway and in 1899 the Baghdad line Abd ul-Hamid's preference for Germany was partly because of the friendly attitude of the German kaiser and partly because he feared the liberal influence which France and England would have over the intellectuals in Turkey.

During the latter part of Abd ul-Hamid's reign the Macedonian question became most important. The independent Balkan states carried on anti-Turkish propaganda among their own races in the Turkish Balkans and it is through this movement that the *comitadjis* appeared in the Balkans. *Comitadjis* were armed bands of political partisans, such as have at various times worked in the Balkan peninsula. Their activities caused risings and slaughter, which were avenged by equal if not greater ferocity, thus adding to Turkish ill-repute in Europe. In 1903 after the Bulgarian insurrection in Macedonia, Turkey accepted the Mürzsteg program, which was prepared by Austria and Russia: the three vilayets of Salonika, Monastir and Uskub (Skoplje) were placed under a Turkish inspector general (Husein Hilmi Pasha) who in turn was under the supervision of Russian and Austrian civil agents. The gendarmerie was given an Italian commander, and French, English, Austrian, Russian and Italian instructors. In spite of these reforms Macedonia could not be pacified and the work of the *comitadjis* went on.

Rise of the Young Turks.—The Young Turks were the successors of the Young Ottomans, who after the closing of the first parliament had worked in secret for the restoration of the constitution by means of publications and secret societies both in Europe and in Turkey, mostly among the students in the military and medical schools. From 1882 onward Abd ul-Hamid had put the press under a strict censorship and by an elaborate network of spies had abolished freedom of speech. The obscurantist educational system was preventing the spread of modern ideas, the Christian schools alone not being affected by this system. Under these conditions Talaat Bey, a chief clerk of the Salonika post office and a student of law, and Rahmi Bey, a local notable, together with a few others, had formed the Secret Society of Union and Progress on the model of the Freemason lodges, to restore the constitution. The Turkish revolutionary societies in Europe were affiliated to the Salonika society through their leader Nazim. Then, provoked by reports that Edward VII of England and Nicholas II of Russia had planned the partition of Turkey *at their meeting in Reval in June 1908*, the officers of Macedonia such as Niazi, Enver, Mustafa Kemal and Jemal Bey joined the society, bringing to it the command of an active force in *the Macedonian army. In July 1908, Maj.* Niazi first led an armed rising in Resna and the other conspirators followed. The revolt shot through the cities of the empire, and Abd ul-Hamid was informed that he had no alternative but to restore the constitution, which he did on July 24. This bloodless revolution aroused enthusiasm even among the Serbian, Bulgarian and Greek *comitadjis* and among the Armenian revolutionaries Representatives of nearly all these came to Salonika and joined the Union and Progress, which ceased to be secret after the proclamation of the constitution. It seemed for the minute as though all the different racial elements of the empire would really unite in a constitutional Turkey. But the separatist and nationalist ideals of the different races were too deeply rooted to be swept away by momentary enthusiasms. The restoration of the constitutional regime postponed the Reval program. But both Austria, which thought Turkey an obstacle to its expansion toward the Aegean sea, and Russia, which found a strong Turkey a hindrance to its plans of expansion, felt uneasy On Sept 15, 1908, the Austrian and Russian foreign ministers A L. von Aehrenthal and A P. Izvolsky (*qq v*) met at Buchlau and agreed on a partition program by which the straits were to be in the Russian zone and Bulgaria a Russian sphere of influence, Macedonia was to be in an Austrian zone and Serbia an Austrian sphere of influence, Albania was to be in an Italian zone and Greece an Italian sphere of influence Three weeks after this meeting Austria annexed Bosnia and Hercegovina (Oct. 5. 1908), and Bulgaria declared its complete independence Turkey recognized the Bosnian annexation, for which Austria paid £2,200,000 and evacuated the sanjak of Novi Pazar. For Turkey's recognition of Bulgarian independence, Russia cancelled £5,000,000 of the Turkish indemnity of 1878, expecting to recover the greater part from Bulgaria. Before long these foreign blows were followed by the recrudescence of internal conflicts. The Albanians revolted against the new regime in Macedonia, and the Kurds attacked the Turks, the Armenians and the Nestorians in eastern Anatolia In Adana the reactionaries attacked the Armenians, and Yemen rose in revolt. Izzet Pasha was sent to pacify the Yemen which he was able eventually to do by a friendly agreement with the imam Yahya (1912). The reactionary opposition in the capital incited fanatical opinion against the new regime Finally the movement passed into a military revolt on April 13, 1909. Some officers and adherents of the new regime were massacred, and parliament was raided. Abd ul-Hamid pardoned the leaders of the revolt and formed a new cabinet. In reply an army under Mahmud Skevket, sent by the Young Turks from Salonika, marched on the capital and punished the insurgents The evident desire of Abd ul-Hamid to restore absolutism led parliament to procure his dethronement by a *fetva*. His brother Mohammed V took his place

Abd ul-Hamid had tried to revive the political influence of the caliphate in the hope of retaining the non-Turkish Moslem elements of the empire. This Pan-Islamic deal was favoured by the German emperor William II who, during his visit to Jerusalem in 1898, spoke of himself as the friend of the "caliph of three hundred million Moslems." Abd ul-Hamid constructed the Hejaz railway to further the same ideal.

Mohammed V (1909–18).—Now that the government of the Young Turks was firmly established, the Committee of Union and Progress became a political party and efforts were made to stop the interference of the army in internal politics. In spite of the great losses of territory the empire over which the Young Turkish party was to rule extended from the Adriatic to the Indian ocean and from Mt Ararat to Tunis. Thirty-three years of mismanagement under the despotic reign of Abd ul-Hamid had reduced Turkey to *such a state that in any case a new government had a* difficult task; and although the Young Turks were full of patriotic zeal and well versed in western culture, they had had no experience in governing. The army was put under intensive German instruction, the navy was put under instructors led by Adm. Sir Douglas Gambles. A French expert, Charles Laurent, was engaged for the financial department, though it was Javid Bey, the minister of finance, who first succeeded in establishing a finance department on European lines. A great change took place in public works through the concessions given to European companies, which brought foreign capital into the country. In every branch a serious and fruitful activity began.

The evacuation of Crete in 1909 by the four controlling powers led to an acute difference between Turkey and Greece In 1910 the Cretans elected deputies to the Greek parliament in Athens, but Eleftherios Venizelos refused to admit them, an act which prevented war.

The Italian and Balkan Wars.—The Italo-Turkish War (*q.v.*) began in 1911. Italy, having been assured of the neutrality of the powers, gave the Porte an ultimatum of 24 hours on Sept. 28. On its rejection the Italian navy bombarded Preveza, and Italian troops landed at Tripoli and in Cyrenaica. Without a strong navy Turkey was unable to defend Tripoli, but Enver and Fethi Beys organized a defense by the natives, who were thoroughly roused,

and the invaders were confined to the coast. Rhodes and the Dodecanese were occupied in May 1912. The outbreak of the First Balkan War forced Turkey to make peace at Ouchy on Oct. 15, 1912. Tripoli and Cyrenaica were left to Italy, but the sultan was permitted to send a representative, called *nasb-i-sultan*. The fate of the Dodecanese islands was not to be decided until the Lausanne conference of 1922–23.

In Aug 1912, a faction in the army, opposed to the Union and Progress party, had brought about a change of government, and the cabinet formed was composed mostly of the members of the old regime, including Kiamil Pasha, the well-known Hamidian grand vizier Russia offered to help Turkey in case of an attack on the Dardanelles on the condition that the Russian fleet be allowed to pass the straits. The Porte refused

To stamp out the *comitadjis*, Turkey had embarked on an attempt to disarm the people in the Balkans. Greece, Serbia, Montenegro and Bulgaria in reply reconciled their conflicting interests in the Balkans and formed an alliance against Turkey (March–Oct. 1912) Turkey was unaware of this alliance for a long time, but on Oct. 8, 1912, Montenegro declared war on Turkey; and on Oct. 14, Greece, Serbia and Bulgaria issued ultimatums demanding reforms and the demobilization of the Turkish army in the Balkans Turkey declared war on Serbia and Bulgaria on Oct. 17, and Greece declared war on Turkey the next day. The political dissensions which affected the command and the organization of the army proved disastrous to Turkey, and the army was defeated, though it made a fine and prolonged defense of Scutari (in Albania), Janina and Adrianople. Adrianople was still in the hands of the Turks when the advance of the Bulgarian army was stopped at the last defenses of Constantinople, the Chatalja lines. The Turkish cruiser "Hamidie," under the command of Rauf Bey, escaped through the lines of the Greek fleet at the straits and wandered in the Adriatic, Aegean and Mediterranean, bombarding enemy ports, hampering their transports and raising Turkish morale. At the beginning of the war the powers had declared that whatever the military results of the war might be the territorial *status quo* would be maintained in the Balkans. Turkey hoped that this declaration would apply as much in the event of Turkish defeat as of Turkish victory. The powers called a conference in London after the Turkish defeat. But since the *status quo* was clearly going to be changed in favour of the Balkan states, in spite of the declaration of the powers, and since Kiamil Pasha's government was about to cede Adrianople even before that city had fallen, the Young Turks determined to seize power again. They raided the Sublime Porte and forced Kiamil to resign. A Young Turkish cabinet was formed under Mahmud Shevket. Although at first the new cabinet refused the terms of peace of the London conference, the intervention of Russia and Austria and the fall of Adrianople enforced their acceptance by treaty at London on May 30, 1913. This brought the Turkish frontiers in Europe to the line Midia-Enos.

A month later the Second Balkan War broke out, with Greece and Serbia fighting Bulgaria over the division of territory. The Rumanians, with the purpose of annexing the Dobruja, also marched on Bulgaria. This moment was seized as opportune by the Turkish army to march on Adrianople, which was recaptured. A treaty of peace was signed with Bulgaria in Constantinople on Sept. 29, by which Adrianople passed to Turkey. On Nov. 13 peace was concluded with Greece, by which it was given Crete and the rest of the Aegean islands except Tenedos and Imbros and the Dodecanese islands, the latter of which were still under Italian occupation. On March 14, 1914, peace was signed with Serbia. The net result of the series of treaties contracted with the Balkan states was the loss to Turkey of all its possessions to the west of the Maritsa river. (*See* BALKAN WARS.)

Young Turkish Policy.—Mahmud Shevket Pasha then attempted a settlement of differences with England and France. Hakki Pasha, ex-grand vizier, was sent to London to come to an understanding over the Persian gulf controversy and to negotiate for the modification of the financial capitulations Javid Bey, ex-minister of finance, was sent to France to settle the railway questions, to modify the financial capitulations and to raise a loan. But during these negotiations the opposition (the Liberal Union) murdered Mahmud Shevket, and the Young Turks passed repressive measures A new cabinet was formed under Said Halim Pasha. A military mission was brought from Germany under Gen. Otto Liman von Sanders, who was also appointed commander of the army corps in Constantinople. The navy was under the Englishman, Adm. A. H. Limpus. A detailed program of reform for the eastern vilayets was prepared. As the powers refused to provide experts, inspectors were engaged from Sweden; the ministry of the interior, however, employed British inspectors.

The policy of the Young Turks had begun by being a policy of "Ottomanism," which aimed at uniting all the racial and religious elements of the empire The risings in Macedonia had proved that the nationalism of each element, encouraged by outside powers, could not be assimilated by such a weak state as Turkey. Turkey through the Balkan War lost its Albanian, Bulgarian, Serbian and most of its Greek subjects, and the Arabs, incited by France, also manifested separatist tendencies, although to give the right to use Arabic officially in the courts in Arabia was the only decentralizing measure the Young Turks had taken. The failure of Ottomanism was followed by the revival of Abd ul-Hamid's Pan-Islamist policy, a decision encouraged by the sympathy which the Indian and the Egyptian Moslems had shown during the disasters of the Italian and Balkan wars. It was this Pan-Islamism which later led the Young Turks to proclaim jihad (holy war) in the hope of influencing the Moslem combatants in the Allied armies during World War I. This revival was led by Enver Pasha; it was opposed, in the name of pure nationalism by a larger group led by Ziya Gokalp, the poet and philosopher, who was helping the cultural-nationalist institutions called the "Turk Yurts" and the "Turk Ojaks" (opened 1912). The influence of Turkish refugees from Russia caused the nationalism of the Union and Progress party to take a Pan-Turanianist form

The disagreement between England and Germany over the Baghdad railway and that between France and Germany over their respective railway spheres were settled by two agreements signed in Feb. 1914 between France and Germany and in June between England and Germany.

World War I.—In 1913 Enver Pasha, formerly Enver Bey, became minister of war. His policy was to give the high commands in the army to younger men. The military organization continued to be under the German mission. There were secret negotiations between Germany and Turkey known only to the grand vizier Prince Said Halim Pasha, Talaat Bey and Enver Pasha. A secret alliance was signed on August 2, 1914, when war was breaking out between Germany and Austria on one side and England, France and Russia on the other. Turkey declared its neutrality but mobilized at the same time. There were war and antiwar factions in the party. The antiwar faction tried to come to an understanding with the Allies, declaring that Turkey would remain neutral if the financial capitulations were modified and a loan granted. Javid Bey, the minister of finance, was at the head of the antiwar faction. The Allies made no promises, but they demanded the dismissal of the German commanders and the expulsion of the crews of two German cruisers which had taken refuge in the Dardanelles. The British government commandeered the two Turkish dreadnoughts which were then being constructed in England with the money raised by popular subscription, an act which, though legal, caused surprise and resentment And when Germany offered the warships "Breslau" and "Goeben" to the Turkish navy the antiwar faction was weakened. The war faction argued that Turkey had lost by its political isolation since the Crimean War, that it should join Germany who was fighting against the hereditary enemy of Turkey, tsarist Russia, and that should Turkey become victorious, it might become free from the capitulations and even regain some of its lost territories. On Sept. 8, 1914, Turkey declared the capitulations abolished, which raised protests from all the powers, including its ally Germany. When the two German warships, which had become units of the Turkish navy though still under German command, attacked Russian ships and ports in the Black sea, Russia declared war, and England and France did the same. Turkey thus found itself at war with the

Allies on the Egyptian, Mesopotamian and Caucasian frontiers as well as at the Dardanelles (*see* DARDANELLES CAMPAIGN; MESOPOTAMIA, OPERATIONS IN; PALESTINE, OPERATIONS IN). The Dardanelles were successfully defended by Turkey, but the Russians took Trebizond, Erzurum and Erzanjan and marched toward Sivas; while Turkey failed in its attack on the Suez canal and the British took Mesopotamia including Baghdad. During the Turko-Russian battles on the Caucasian front, the Armenians created disturbances behind the Turkish lines and threatened to cut the lines of communications. The Turkish government began early in 1915 a general deportation in which atrocities were committed on a large scale. When Gen Antranik, the Russo-Armenian general, entered eastern Anatolia, the Armenian soldiers under his command (so-called "Christian Army of Revenge") replied by similar atrocities, though on a far smaller scale. As Turkey had mobilized to its utmost limit it became almost impossible to sustain the army, the civil population suffered privation hitherto unknown; martial law was proclaimed everywhere. The Communist Revolution led Turkey and its Allies to conclude a peace treaty with Bolshevik Russia at Brest-Litovsk, March 3, 1918, by which all its lost territory was restored to it (even those districts which it had ceded to Russia in 1877). But the Arab nationalists, supported by England, drove out the Turks from Hejaz, except from Medina The British army occupied Syria. On Oct. 30, 1918, an armistice was signed at Mudros, on the British warship "Agamemnon," between Adm. S A. G Calthorpe and Rauf Bey, the Turkish minister of marine. Although the armistice aimed at ending World War I, it did not end yet for Turkey who had to fight for four years more actually against Greece though virtually against the Allies themselves

During the war secularization in education and other departments had taken place. The university had been extended and its principal chairs were occupied by German professors. The Sheria courts were taken from the sheikh ul-Islam and given to the ministry of justice. A family law issued in 1916 reformed marriage and divorce regulations. Women, who already had equal education with men, now filled public posts, and the university opened its doors to them.

Mohammed VI (1918–22).—Mohammed V had died in July 1918 and had been succeeded by his brother Vahid ed-Din, who took the name of Mohammed VI. In the early months of the reign the Turks welcomed the armistice as being the end to the great suffering of long years. But they soon forgot this suffering in the humiliation and persecution to which they became exposed The Allied fleets and armies occupied the straits, Istanbul and even places outside the armistice line, and the terms of the armistice were stretched to the point of violation. Under these conditions the Turks had a bitter foretaste of the peace that they would receive at the hands of the Allies. Both in Istanbul and in the provinces, officers and intellectuals met in secret and began to discuss how to secure a tolerable peace, and as the nationalists appeared in the forefront of the general reaction against the Allies this agitation received the general name of the "nationalist movement." Meanwhile the Allies could not come to an agreement among themselves over the Turkish peace. Finally, on May 15, 1919, the Greek army was landed in Smyrna under the protection of the British, French and U.S. fleets, and the Greeks inaugurated their occupation by massacres committed in full view of the Allied fleets. (Italy, having retired from the peace conference for the moment, did not take part. By the interalhed agreement of St. Jean de Maurienne in 1917, Smyrna and Adalia had been apportioned to Italy, and Italy had landed troops in Adalia in April 1918.) The Greek landing in Smyrna aroused general indignation in Turkey which ended in the national determination to resist to the last, even if this meant total disintegration. Mass meetings in Istanbul were the first manifestation of this feeling.

The National Pact.—Meanwhile Turkey was in a state of anarchy. The responsible leaders of the Union and Progress party had escaped to Germany, and the party was dissolved. Mohammed VI, a personal enemy of the Young Turks, forced Izzet Pasha's cabinet, which to some extent was able to keep order, to resign, and the Liberal Union came into power. Certain nationalist leaders wanted to save the country from disintegration by cooperating with the sultan and using his prestige as sultan-caliph. Among these was Mustafa Kemal Pasha. But Mohammed VI preferred to sacrifice the existence of his nation to his personal security, and this he did by bringing Damad Ferid Pasha into power and, through him, giving the reins of the government to the high commissioners of the Allies. In western Anatolia organizations for a national defense against the Greek invasion were rapidly arising. In eastern Anatolia, especially in Trebizond and Erzurum, associations, under the guidance of Kiazim Kara-Bekir Pasha, were preparing to oppose any attempt of the Allies to create an Armenia out of the territories which, even before the deportations and atrocities, they claimed to have been predominantly Turkish. The sultan with the Allies' assent, in order to control these organizations and disperse them if necessary, sent Mustafa Kemal Pasha to eastern Anatolia as the military inspector general Kemal reached Samsun four days after the Greek landing at Smyrna But as he was already in correspondence with these organizations, he met Rauf Bey, Ali Fuad Pasha and Col. Refet at Amasia on his way to Erzurum and signed the Amasia protocol on June 19, 1919; Kiazim Kara-Bekir Pasha also signed by telegram This protocol is the first document that formally declared the national determination to resist both the Allies and the sultan, as the instrument of the Allies. A national congress assembled in Erzurum, on July 23, 1919, and Mustafa Kemal Pasha, having resigned from the army, presided. Another congress assembled in Sivas on Sept 4, 1919, to which the national associations of western Anatolia sent representatives. This congress reaffirmed the decisions of the Erzurum congress, added plans for the defense of Eastern Thrace and chose a representative body to control the movement in Anatolia. No president was chosen, but Mustafa Kemal Pasha's leadership was generally recognized. This manifestation of the national will forced the sultan to dismiss Damad Ferid Pasha. A new cabinet with nationalist tendencies came into power. In Jan. 1920 a new parliament assembled in Istanbul, containing a nationalist majority. The parliament issued the national pact as accepted by the two congresses

This national pact formulated the demands which the nationalists made during the whole struggle, and which they obtained eventually at Lausanne. It proposed self-determination for the Arab provinces south of the armistice line; it agreed to the opening of the straits to commerce and it proposed to grant to non-Turkish minorities the same rights as they had secured in Europe under various postwar treaties. The pact also demanded, either explicitly or implicitly, that Turkey should retain all territories inhabited by non-Arab Ottoman Moslem majorities, which meant not only Anatolia but eastern Thrace and the Mosul vilayet; that Istanbul should be given military security; that the capitulations should be abolished and that there should be a reasonable settlement of the public debts.

The Allies were watching with some anxiety the nationalist activities, which consisted mostly of smuggling in arms and ammunition and organizing the defense. Mustafa Kemal Pasha stayed in Anatolia to conduct these activities. The Allies, in conjunction with the sultan and the Liberal Union party, decided to strike at the nationalist movement through the persons of the leading deputies and intelligentsia in Constantinople. On March 16, 1920, the Allied forces in the capital seized a large number of nationalists, including Rauf Bey, the leader of the nationalist party in parliament, and Kara Vasif Bey, the head of the nationalist organization in Constantinople, arresting them in the parliament house itself. Parliament was then closed by the orders of the sultan. Some deputies and a few of the intelligentsia escaped to Ankara, which had become the nationalist centre.

The Ankara Government.—Mustafa Kemal Pasha had issued a proclamation inviting Anatolia to elect its deputies for a new assembly, which was opened in Ankara on April 23, 1920. Mustafa Kemal Pasha was elected president both of the assembly and of the government. Thus came into existence a new Turkish government over all territories not under foreign occupation. A new temporary constitution, known as the Law of Fundamental Organization, proclaimed the sovereignty to belong to the nation without restriction, and the great national assembly to be the sole

and lawful representative of the nation, exercising sovereignty in its name. But Mustafa Kemal Pasha tried to make use of those who were still loyal to the sultan by declaring in his speeches that the sultan-caliph was a prisoner in the hands of the Allies and that he would be restored after the realization of the national ideal The government of Istanbul, controlled by the Allies, condemned the leading nationalists to death by extraordinary courts and issued a *fetva* denouncing them as outlaws. The Anatolian government retaliated similarly. The sultan's government sent forces under the name of the caliphate army and roused counterrevolutionary outbreaks around Ankara, which, however, were put down by the nationalists When the Allies found themselves embarrassed by the nationalist success, they accepted the offer of Venizelos that the Greek army should advance beyond the area allotted to it in order to deal with the nationalists. In the months of June and July 1920 the Greek army occupied eastern Thrace and marched on to Bursa and Ushak. On Aug. 10, 1920, the Allies concluded the treaty of Sèvres with the sultan's government in Istanbul which aimed at destroying the independence of Turkey. In Europe, eastern Thrace nearly as far as the Chatalja lines, including Gallipoli, was assigned to Greece; and provisionally Greece was also given Smyrna and a zone around it A tripartite agreement between England, France and Italy laid out French and Italian spheres of influence in parts of those Anatolian territories which under the peace treaty were nominally left to Turkey. The outlines of the Armenia which was to be formed in eastern Anatolia were left to Pres. Woodrow Wilson to define. The treaty strengthened the nationalist cause by arousing unanimous indignation. The British forces in Eskushehir withdrew under the pressure of Ali Fuad Pasha's forces In Cilicia and Aintab the nationalist forces were struggling successfully against the French army.

The continual raids by the Armenians of the Armenian republic on the Turkish frontier villages, as well as the necessity for a direct route to Russia, led Turkey to attack the Armenian republic. The Turkish army captured Kars and Alexandropol, and a victorious peace was concluded with Armenia at Alexandropol on Jan. 3, 1921. A Turkish delegation sent by the Ankara government signed a treaty of friendship with Russia by which Russia became the first country to recognize that government. The Menshevik government of Georgia was overthrown, and Turkey with the consent of Georgia occupied Ardahan, Artvin and Batum. When the Caucasian republics were federated to Russia, a treaty signed in Kars Oct. 16, 1921, between Russia, the government of Ankara, and the three Caucasian republics, left Kars, Ardahan and Artvin to Turkey and restored Batum to Russia.

The defeat of Venizelos in the general elections in Greece and the return of King Constantine alienated the Allies, especially France The Greek army in Anatolia started a new offensive, but was twice checked by the Turkish army at Inonu (January–April 1921). The Allies called a conference in London to which representatives of both the government of the sultan and the government of Ankara were invited (January–February 1921). At this conference it became clear that the Allies realized the necessity of amending the treaty of Sèvres: the Ankara delegates initialled agreements with the French and Italian governments which were not accepted by Ankara. These agreements nevertheless were the first signs of the difference of opinion between the Allies on the Turkish question The Allied high commissioners at Istanbul as a result of this dissension announced the neutrality of their governments on May 18, 1921, and designated neutral zones forbidden to the belligerents on each shore of the Bosporus and the Dardanelles On July 10, 1921, the Greek army once more passed to the offensive and drove the Turkish army east of the Sakariya. At the suggestion of a commission of inquiry sent by the great national assembly to the front, Mustafa Kemal Pasha was now appointed generalissimo. He fought during 20 days the decisive battle of the Sakariya, after which the Greeks retired westward As a reward he was made marshal and was given the title of *ghazi* by the great national assembly.

Henri Franklin-Bouillon was delegated by France to negotiate an agreement which was signed in Ankara on Oct. 20, 1921. It recognized the Ankara government and traced the Turko-Syrian frontier, as later reaffirmed in the Lausanne treaty. On March 24, 1922, the Allies intervened in common to propose a truce between Turkey and Greece, but the Turks declared that they could only negotiate after the evacuation of Anatolia. However, the Ankara government sent to Europe first Yusuf Kemal Pasha, the commissary of foreign affairs, and then Fethi Bey, the commissary of the interior, to seek a peaceful solution. Fethi Bey arrived in London with especially conciliatory proposals, but during his three weeks' stay was not received by any cabinet minister. The Ankara government concluded that the question could be settled only by force of arms. The Greeks, to raise their morale, demanded permission to occupy Istanbul, which the Allies refused. On July 30, 1922, Aristeides Stergiadis, the Greek high commissioner in Smyrna, proclaimed the autonomy of the Anatolian territory under Greek occupation, apparently with the intention of continuing the Anatolian war in the guise of a local Greek national movement, in case the Greek army should be compelled by diplomatic pressure to evacuate Anatolia. The Allies proclaimed their neutrality for the second time on August 10, 1922, by the decision of the supreme council of war

The Turkish offensive began on Aug. 26 and the Greek army was completely routed. On its way from Ushak to Smyrna, it burned to the ground the most prosperous towns in the west of Turkey, and atrocities were committed on a large scale. Nearly a million people were made homeless. The Turkish army entered Smyrna on Sept. 9, and masses of the native Christians left the town in great disorder. The central part of the town was burned on Sept. 13.

The annihilation of the Greek army produced a dangerous situation. At first England and France agreed to act in concert in case of necessity by opposing any Turkish violation of the neutral zones. On Sept. 16, David Lloyd George further announced that the British dominions, Yugoslavia and Rumania had been asked to promise military support for maintaining the freedom of the straits. This announcement incited the Turks to action, both by its threatening tone and because it contained no reference to the nationalists' territorial demands in Eastern Thrace. In consequence the Turkish army advanced toward the neutral zone. France and Italy withdrew their troops, and Franklin-Bouillon was sent to Smyrna from Paris to mediate with Mustafa Kemal Pasha and so arrest the march of the Turkish army. The British troops remained alone. On Sept. 23, Lord Curzon came to an agreement with M. Poincaré which accepted the British view regarding the temporary question of the neutral zones and the French view regarding the definitive peace terms. On the same day, in accordance with this agreement, the principal Allied powers invited the Ankara government to a peace conference on two bases: that Turkish sovereignty should be restored in Thrace up to the river Maritsa, and that during the interim period, pending the negotiations and entry into force of the peace treaty, the inviolability of the neutral zones should be maintained. Meanwhile the Turkish cavalry had advanced almost up to the British wire at Chanak, and only the tact and firmness of Gen. Charles Harington, as well as his desire to prevent war, averted a disaster. The nationalists accepted the Allied invitation and suggested a preliminary conference on Sept 29. On Oct. 13 a military convention was signed at Mudania between the Ankara delegates, the Allied generals in Istanbul and Greek representatives.

The Allies had also invited the sultan's government to the peace conference. Tewfik Pasha, the last grand visier of the Ottoman empire, wrote to the great national assembly proposing joint action, and this made it necessary for the assembly to face the dilemma of having two governments in one country. In consequence the caliphate was separated from the sultanate, the sultanate was abolished, and the sovereignty of the nation without any restriction, already inserted in the new constitution, was reaffirmed on Oct. 1, 1922. It was decided, however, to keep the caliphate in the house of Osman. The governmental departments in Istanbul then passed to the Ankara government, which formality was accomplished by Refet Pasha, that government's high commissioner for Thrace Thus the house of Osman, which had reigned for seven centuries, came to an end through the treason of its last

sultan, Mohammed VI, and for the first time in its history Istanbul was no longer the capital of the state to which it belonged On Nov. 17, 1922, Mohammed VI took refuge in the British warship "Malaya" and escaped to Malta. The commissary of Sheria deposed the refugee caliph by a *fetva* and elected Prince Abd ul-Mejid, the son of Abd ul-Aziz, as caliph. The new caliph recognized the sovereignty of the great national assembly and gave up his claims to the sultanate by a written document. This was the last time the Turks used the *fetva*

The Treaty of Lausanne.—The Lausanne conference met on Nov. 20. 1922, and after a recess from Feb. 4 to April 23, 1923, signed a peace treaty on July 24. By it the Turks procured the demands they had put forward in the national pact, except that concerning Mosul. The capitulations were abolished. To realize racial unity in new Turkey the Orthodox Greeks in Anatolia were to be exchanged for the Moslem Turks in Greek Macedonia; the Greeks of Istanbul and the rest of the Christian minorities were to have the same rights as were secured to other minorities in Europe under the postwar treaties. The tracing of the frontier with Iraq was to be discussed between England and Turkey at a future date and if necessary to be submitted to the League of Nations. Turkey also concluded treaties with the U.S. and Poland which restored diplomatic relations with these countries.

(A. A. A.; G. L. L.)

THE REPUBLIC

The Ottoman empire, which had tried to end the war in 1918 by the armistice of Mudros, was no more. The Turks, principal element of the defunct empire, had created a new independent Turkish state. The new Turkey had abolished the capitulations and contracted treaties with all the other states. Released from external troubles, it was free to begin a new era of progress and reconstruction. The new constitution was not complete, and the position of the president of the national assembly, who was the head of the state at the same time, was vague. Taking advantage of this, during a difficulty in forming a new council of commissaries, Mustafa Kemal Pasha proposed a constitutional amendment by which Turkey would become a republic (Oct. 29, 1923) This amendment was accepted, and Mustafa Kemal Pasha was elected the first president of the Turkish republic. Ismet Pasha, his right hand man, formed a cabinet.

Mustafa Kemal's Presidency.—Mustafa Kemal Pasha accepted the clause in the new constitution which declared the state religion to be Islam. But there was a growing conviction that radical reform would be possible only after freeing the state from religion. Turkey after adopting the republican form of government was determined to complete the partial secularization of the preceding regime and to prevent all interference by religious influence, which was regarded as having been the principal obstacle to modernization The clause in the constitution declaring Islam the state religion and the position of the *jainéant* caliph were accordingly the first objects of attack. On March 3, 1924, the great national assembly passed three laws at one sitting: (1) expelling the Ottoman dynasty; (2) abolishing the caliphate, the commissariat of *sheria* (the recognized office for the religious affairs) and *evkaf* (pious foundations) and (3) attaching all the educational and scientific institutions, including the *medresses* (religious colleges), to the commissariat of public instruction. By these laws the Turkish republic put an end to Pan-Islamism in Turkey and also paralyzed the Khilafat movement in British India. The most important step in secularization was the clause of one of the three laws which withdrew the civil transaction section of the *sheria*, which so far had dominated the Turkish code through the *mejelle* (Turko-Islamic code). The dispatch of all concerns and cases which related to dogma and religion passed to an office called the presidency of religious affairs. Thus for the first time Turkey tried to separate religion from the state. Of the two classes, the ulema and the military, which had dominated the Turkish state, the ulema were no more. The military, from the time of the *tanzimat*, had nominally ceased to interfere in internal politics. But in spite of the deposition of Abd ul-Aziz (1876), the re-establishment of the constitution (1908) and the nationalist movement (1918) were all brought about through the army. And although during the last and most important changes of regime, including state secularization, military influence was not obvious, the force behind the throne in the Turkish state was still the army A month before the passing of these laws Mustafa Kemal Pasha assembled the commanders of the army in Smyrna and discussed these questions with them, thus diplomatically shifting the responsibility to the shoulders of the army in case of any public opposition. A new constitution which was extremely democratic in form was adopted on April 20, 1924. To win over the peasantry, who constituted the majority and who did not regard these radical measures favourably, the tithes, which lay heavily on the agricultural classes, were abolished and military service was reduced to 18 months. The deficit in the revenue resulting from abolition of the tithes was met by a heavier taxation of the urban population.

Although constitutionally the natural sovereignty was in the hands of the national assembly, Mustafa Kemal Pasha, through his personal prestige won in the field and through his hold over the army, showed decided tendencies toward a personal dictatorship. This created an opposition under Rauf Bey and Kiazim Kara-Bekir Pasha, which attempted to keep the republic on a democratic and liberal basis and was called the Republican Progressive party (Nov. 1924) Ismet Pasha's cabinet fell and Fethi Bey, a liberal and moderate statesman, formed a new cabinet. The Kurdish provinces revolted because they resented the extreme centralization and the harsh measures of the government in carrying out new reforms and because of the separatist tendencies of some of the leading chiefs. Mustafa Kemal Pasha seized this as a pretext to strike at the opposition. Pretending that the liberal clause in the Progressive program which advanced liberty of conscience had encouraged this rising, he forced the Fethi Bey cabinet to resign, on the ground that it had refused to carry out drastic measures in the peaceful parts of Turkey. Ismet Pasha formed a cabinet for the second time. The law of maintenance of order was passed.

With the passing of this law, the tribunals of independence, which had functioned during the nationalist struggle against the antinationalists, were revived. The opposition party was suppressed. The freedom of speech which the new constitution had accorded to the Turkish nation was evaded through the very vague terms of the law. Mustafa Kemal was able to establish his dictatorship, despite a very democratic assembly, by the absence of any clause in the constitution which would place the president of the republic above parties. Therefore he, as the active president of his own party, could wield unbounded power. The Kemalist party (People's party), like Abd ul-Hamid and the Committee of Union and Progress, believed that the Turkish nation was not yet ready for a liberal regime. Although the Kurdish insurrection was put down by tribunals and military operations, the disturbances continued in Van, Bitlis and Diarbekr and led the republic to begin a partial deportation of the Kurds. The religious orders were abolished and the *tekkes* (monasteries) were closed as having influenced the Kurdish rising. A decree ordered the army to adopt a kepi and the civil servants to wear hats A law passed in Nov. 1925 abolished the fez and obliged everybody to wear hats (women were not included). This law provoked several counterrevolutionary risings in the eastern provinces, which the tribunals suppressed by death sentences and imprisonments. On Feb. 17, 1926, the assembly adopted a new civil code which was almost a translation of the Swiss. By the adoption of this code Turkish legislation was wholly freed from Islamic influence. The laws concerning marriage, divorce and inheritance, which had been totally different from those of the west, were altered, and polygamy was legally prohibited. This radical secularization led the non-Moslem minorities to renounce of their own accord the minority rights which they had procured at the Lausanne conference The secular republic had now only two points of contact left with religion: the clause in the constitution which stated that the religion of the state was Islam, and the law which attached the presidency of religious affairs to the prime minister's office. The former of these was broken on April 9, 1928, by an amendment to the constitution.

On the pretext of a conspiracy against Mustafa Kemal Pasha's life, "discovered" in the summer of 1926, all the members of the

suppressed opposition party, both in and out of the assembly, as well as the leading members of the Union and Progress party, were arrested by the tribunal of independence. At the trial political opponents were assumed to be conspirators by the mere fact of their being in the opposition. Kiazim Kara-Bekir Pasha, Ali Fuad Pasha and Refet Pasha were acquitted by the pressure of the army. Several members of the assembly, whose parliamentary immunity was violated and who had been in the forefront of the nationalist movement, were executed. Javid, the foremost Turkish financier, Shukri, Nazim and Janpoulant, all ex-ministers of the Unionist regime and some of them deputies, were also executed The ex-prime minister Rauf, who was in Europe at the time, was condemned to ten years' imprisonment.

A decree of 1928 discarded the Arabic alphabet for the writing of Turkish and imposed the Roman instead. This change was in accordance with the policy of modernizing the language itself and freeing it from its dependence on Arabic and Persian.

The year 1930 saw two advances in Turkey's political life: women received the vote for municipal elections; and on Aug. 13 the former prime minister, Fethi Bey, formed an opposition group, the Liberal Republican party. In the municipal elections of the same year his party polled about 25% of all votes, women were for the first time elected, and the Greek, Armenian and Jewish minorities presented their candidates. But by the end of the year the opposition party was dissolved.

Turkey did not escape the economic depression of the early 1930s. But that adversity did not arrest—although it curtailed—the economic reconstruction of the country. This was fostered by the formation of a number of state banks, to each of which was delegated the establishment and control of state industrial and mining enterprises and public utilities. A long-term credit of $8,000,000 was negotiated with the Soviet government for the acquisition of Russian cotton-spinning machinery. Many occupations, until then mostly exercised by foreigners, were reserved for Turks—partly to promote their education in trade and commerce. In 1932 a five-year industrial plan was promulgated and an important program of economic and educational reforms was launched. The metric system was adopted; and English replaced French, Arabic or Persian as the principal foreign language to be taught in the schools.

On Dec. 6, 1934, the great national assembly changed the constitution so that all Turkish men and women were henceforth entitled to vote in legislative elections as soon as they had reached the age of 23 and to become elected at the age of 31. At the same time it was also decided that the president was to be elected from among the deputies, his term of office being identical with the life of the assembly. During 1935 women were for the first time elected to the great national assembly. The international women's congress met at Istanbul in April of the same year. Sunday was introduced (in place of Friday) as the weekly rest day. The old Turkish titles—such as pasha—were abolished; and family names were introduced, as in the west. Mustafa Kemal received the surname of Atatürk; the premier Ismet, that of Inönü. On Feb. 5, 1937, the assembly accepted the six principles of the Republican People's party—republicanism, nationalism, democracy, evolutionism, separation of state and religion and state supervision of the principal industries, public utility services and means of communication.

In Oct. 1937 Ismet Inönü, who had been prime minister for almost 15 years, resigned and was replaced by the former minister of economic affairs Celal (Jelal) Bayar. After the death of Kemal Atatürk on Nov. 10, 1938, at the age of 58, Inönü was elected president of the republic.

Foreign Affairs.—On May 19, 1924, a conference assembled in Istanbul to trace the Turko-Iraqi frontier, which had been left over by the Lausanne conference. No result was achieved and in accordance with the decision of the Lausanne conference, England and Turkey submitted the question to the League of Nations. On Dec. 16, 1925, the League decided to give most of the vilayet of Mosul to Iraq. To this the Turks would not at first consent. A treaty of mutual neutrality was concluded on Dec. 17 for three years with the U.S.S.R. Turko-Soviet relations, which had become distant since the Lausanne conference, once more became very close. The *Turk* [illegible] was not mitigated [illegible] stating that Turkish [illegible] Germany. [illegible] no Pan-Turanian [illegible] overnme[illegible] British, Turkish and [illegible] signed a treaty on June [illegible] Iraq with a slight rectification [illegible] for a period of 25 years from [illegible] the Iraqi government was [illegible] received from the expiration [illegible] 1926, a treaty of neutrality [illegible] treaty of perpetual peace and [illegible] istan on May 27, 1928, and a [illegible] tion with Italy on May 30, [illegible]

In 1930, after an exchange of [illegible] and arbitration were signed [illegible] co-operation between Greece and [illegible] also maintained with the Soviet [illegible] and Balkan conference met in [illegible] delegates from Albania, Bulgaria, [illegible] Turkey attending. In July 1932 [illegible] and at about the same time [illegible] Britain and France. A further step [illegible] on Feb. 9, 1934, when under Turkish leadership a Balkan entente —which included Rumania, Yugoslavia, Greece and Turkey (but not Bulgaria) was established. In Nov. 1935 the existing treaties with the Soviet Union were prolonged for a further ten years. The treaties with Iran, Iraq and Afghanistan were consolidated by the signing, at Saadabad on July 9, 1937, of an Asiatic pact of nonaggression with those states.

The rapprochement with Great Britain became more marked in 1936. Turkey promised to co-operate with Great Britain in case of a conflict with Italy in the Mediterranean; and a conference at Montreux removed (with British support) the limitations imposed upon Turkey by the treaty of Lausanne in respect of the militarization of the straits. The visit of King Edward VIII to Istanbul still further strengthened Anglo-Turkish relations.

By an agreement with France of July 3, 1938, the district of Alexandretta was established as an autonomous part of Syria, but conforming in most respects to the order prevailing in Turkey. It received the name Hatay, after the ancient Hittites, regarded by the modern Turks as their ancestors. In less than a year Hatay was ceded wholly to Turkey, at the signing of the declaration of mutual assistance with France.

World War II.—As president, Ismet Inönü followed, on the whole, the constructive and cautious policy of his predecessor. But his cabinet was soon faced with the imminence of war in Europe. In view of this crisis Turkey signed declarations of mutual assistance with Great Britain (May 12, 1939) and France (June 24), aiming at the maintenance of peace in the eastern Mediterranean.

Turkey's position seemed secure because of its friendship with the western democracies on the one hand and with the Soviet Union on the other. Turkey might indeed have become the connecting link between these two camps, both of which were then opposed to German aggression. But the pact of friendship between the Soviet Union and Germany of Aug. 1939 profoundly altered Turkey's position. Turkey tried to maintain its friendship unchanged, and the Turkish foreign minister visited Moscow in the autumn, but without result. On Oct. 19, therefore, Turkey concluded a treaty with Great Britain and France, and a series of staff talks between the general staffs of the western democracies and Turkey began. Turkey was unable however, to transform the Balkan entente into a military alliance.

Italy's entrance into the European war in May 1940 extended the area of the conflict into the eastern Mediterranean and thus created for Turkey a *casus foederis*. But the downfall of France and the complete uncertainty of the future of Great Britain made Turkey hold back. Although Turkey made every effort to increase the strength of its army it was largely a bayonet army, inadequately equipped with modern aircraft and armour. President Inönü, therefore, adopted a policy of neutrality. Nevertheless, although Turkey did not enter the war as an active ally of Great Britain, it continually stressed its solemn intention of remaining

faithful to the alliance.

It was expected that Turkey would enter the war actively if the security of the straits or of the near eastern oil fields were threatened, or if Bulgaria and the Greek region of Salonika—which Turkey regarded as her security zone—were invaded Accordingly, in Jan 1941, Anglo-Turkish staff talks were held in Turkey and the British foreign secretary Anthony Eden visited the country But fear of German military superiority kept the Turks inactive when the time for action came Thus, when the German army occupied Bulgaria at the beginning of March, Turkey did not move, nor did it come to the help of Greece and Yugoslavia when they were attacked by Germany. The German conquest of Greece and the occupation of the Greek islands in the Aegean sea in the spring of 1941 isolated Turkey strategically and made its participation in the conflict impossible for the time being. By the end of 1941 the war had come near to Turkey on all sides. Bulgaria was in it on the side of the axis. Greece was completely occupied by Bulgarian, Italian and German forces Greek and Italian islands held by the axis were being equipped for fighting. Syria, Iraq and Iran were thoroughly controlled by Great Britain, Free France and the U.S.S.R. The Balkan entente and the Asiatic pact had gone, and the Anglo-Franco-Turkish treaty for mutual aid was uneasily asleep Turkey sat alone—a small neutral buffer state in the midst of mighty antagonists.

In general Turkey had nothing to lose and everything to gain by a policy of neutrality. It held no colonial territory and desired no extension of boundaries. Its economic surpluses were eagerly sought by both sides Participation in the war would have meant heavy expense and renewed depletion of its manpower. During almost five years of World War II, therefore, Turkey maintained a firm and scrupulous neutrality. No concealment, however, was made of a determined intention to resist with all resources any invasion of its territory The danger of invasions by axis forces was certainly great: in fact, Hitler's choice in June 1941 to attack the U.S.S.R. rather than to overwhelm the middle east probably saved Turkey from terrible disaster. A German drive might have rolled with comparative ease across Turkey to Egypt and the Persian gulf, to join forces with Japan in southern Asia. This danger was averted, but it was not removed so long as Germany was active in North Africa and advancing toward the Caucasus and Iran. But the resounding defeats of El Alamein and Stalingrad remove the "pincers" threat, and after Jan. 1943 Turkish fear of Germany diminished rapidly.

Under the circumstances Turkey's neutrality was convenient to both sides. The Germans, while fighting in the U.S.S.R., could feel secure against a thrust from the southeast. The Allies on the other hand possessed a neutral barrier on the north while they strengthened themselves in Egypt and improved the roads across Iran for transporting supplies to the Soviet Union. In particular, Turkey protected the Anglo-Iranian oil fields, which were of vital consequence to the whole eastern war.

In the midst of its tribulations the Turkish government had thought best to sign a two-year nonaggression pact with Germany on June 18, 1941, only four days before the German attack on the U.S.S.R. This was followed on Oct. 9, after much haggling, by a commercial treaty. products to the value of £T100,000,000 on each side were to be exchanged during 1943 and 1944; Germany was to deliver to Turkey war material to the value of £T18,000,000, and in exchange Turkey agreed to provide Germany with 90,000 tons of chrome ore per year. Great Britain and the United States offered counter proposals: on Dec 3, lend-lease advantages were promised to the Turks, and in March 1942 a first large shipment arrived During the course of the war the Anglo-Saxon countries continued to provide Turkey with war material, naval vessels, locomotives, railway cars, wool, cotton yarn, mining machinery and foodstuff (military preparedness had caused shortages of foodstuffs by removing men from the farms). The supplies entered Turkey mainly at Mersine and Alexandretta, ports which were improved by wharves and jetties. While the western nations steadily increased their support of Turkey, Germany was less and less able to fulfill its promises and was reported to have received only 25,000 tons of chrome ore during 1943, paying four times the prewar price for it.

Relations with the Soviet Union were disturbed after an attempt in Feb. 1942 to assassinate the German ambassador Franz von Papen. Among 50 persons arrested five were Russians Two of the latter—employees of the Soviet consulate in Istanbul—were convicted on June 17

In July Shukru Saracoglu, who had long served successfully as Turkish foreign minister, became premier. In Feb 1943 a new great national assembly was elected. Meeting in March, it re-elected Ismet Inönu as president for four years The president conferred at the end of January with the British prime minister Winston Churchill at Cairo. He returned there in December to meet Churchill and Pres. Franklin D. Roosevelt. Both conferences appeared to be very cordial, but no visible changes of Turkish policy ensued

The heavy war expenditure strained Turkish finances seriously. To meet the deficit a law of Nov 11, 1942, created a form of capital levy tax called the *varlik vergisi*, the penalty for nonpayment was forced labour in the eastern provinces. The tax was fairly levied upon Moslem Turks and foreigners but it was unjustly and ruthlessly applied in the case of Jews, Greeks and Armenians of Turkish nationalty—against whom considerable feeling had been aroused because of their alleged war profiteering. Within six months more than £T300,000,000 had been collected.

The year 1944 brought increasing successes to the Allies and discomfiture to the axis; and Turkish policy responded cautiously to the change. In January the Japanese Domei correspondent was expelled. In May a Pan-Turanian and fascist plot was uncovered in Istanbul; many arrests were made and martial law was proclaimed. In March, however, relations with Great Britain became strained because Turkey was still shipping chrome ore and other products to Germany and manifested no intention of joining in the war. Great Britain, therefore suspended shipments to Turkey of munitions and foodstuffs. In justification of its inaction Turkey claimed that it had not received the quantity of war material which had been promised

Not until Aug. 2, 1944, did Turkey yield to pressure from the United Nations to fulfil its treaty obligations, and then it only broke off relations with Germany. Promptly thereafter German representatives left Turkish soil and commercial exchanges came to an end. Turkey, however, still refused to declare war and join in the final grand assault in Germany It did not, indeed, make the formal declaration until Feb. 23, 1945 after the Allies had announced that only those states which had done so would be invited to take part in the United Nations conference at San Francisco.

Internal Affairs after World War II.—The collapse of the Nazi regime and the close association of Turkey with Great Britain and the U.S. were bound to weaken Turkey's attachment to the one-party system established by Kemal Atatürk. It came to an end in Jan. 1946 when the Democratic party—an opposition party founded by Celal Bayar, one of Turkey's most eminent statesmen—officially came into existence. The new party received the blessing of the president, the government and the press. The first election under the two-party system was held in July 1946, and resulted in a sweeping victory for the government. The opposition leaders charged the government agents with irregularities. The result, however, would probably have been much the same if the votes had been properly counted.

The great national assembly took westernization of its parliamentary system in its stride The Democratic party followed the maxim that it was the duty of the opposition to oppose. It constantly criticized the government, and its effectiveness was out of proportion to its numbers. It continued to gain strength in the country, but it refused to contest any of the by-elections of 1948 and 1949 on the grounds that the amendments to which the government had consented in the electoral law had not gone far enough. Early in 1950, however, a new electoral law was passed by the assembly which provided all the safeguards demanded by the opposition (secret ballot, public counting, judicial supervision, etc.); and on May 14, a general election was held. It resulted in an overwhelming defeat for the Republican People's

party, which had been in power continuously since 1923. The Democratic party won 416 seats against 69 for the Republican People's party and one Nationalist The president of the assembly and all the ministers, except the prime minister, lost their seats. Celal Bayar was elected president of the republic. He invited Adnan Menderes to form a cabinet. A distinguished historian and university professor, Fuat Koprulu, became minister of foreign affairs.

The Democratic party drew its leaders mainly from the middle class: they were merchants and industrialists, with a few professors and journalists. Its domestic policy might be described as liberalism plus the nationalization of railways, power, coal, steel and other large-scale activities, but greater scope was promised for private enterprise. In foreign affairs it undertook to carry on the policy of its predecessors.

Communism did not appear to be a serious problem in Turkey after World War II. Its doctrines would not ordinarily appeal to a prosperous Moslem peasantry, and the fact that it was sponsored by Russia, the historic enemy of Turkey, handicapped Communist agents and propaganda Nevertheless, the government decided to prohibit Communist organizations. In 1946 out of 55 suspects arrested, 44 were convicted of being members of an illegal organization, and several professors were dismissed from Ankara university for Communist sympathies. Attempts to start a Communist movement were however revealed in 1951, when a further considerable number of arrests were made.

The most serious problem which confronted successive governments during and after the war was the cost of living. In 1947 the Istanbul Chamber of Commerce stated that "the minimum monthly expenditure for a family of five persons was £T348, or £T550 less tax. Yet thousands of families were eking out a miserable existence on £T100–£T150 per month. For them there was no alternative but to accept bribes or starve."

One of the most important measures adopted by the great national assembly was the land reform bill of 1945. It aimed at converting Turkey into a country of smallholders by distributing state and ecclesiastical lands, reclaimed and uncultivated lands and privately owned lands more than 4½ sq.km. in area among landless peasants and immigrants. The dispossessed owners were to receive 4% state bonds for their property, and the agricultural bank was to grant loans to the peasants, free of interest and repayable over 25 years, to assist them in stocking and equipping their farms The bill also had provisions against the splitting of holdings through inheritance.

After protracted discussions, the great national assembly decided in 1948 to introduce the teaching of Islam—but only in the two highest classes of the primary schools and outside the regular school hours.

Foreign Relations.—Until the establishment of the republic, Russia and Turkey had engaged in a continual succession of wars for nearly 300 years. Russia, therefore, came to be regarded by the Turks as the inveterate enemy, the inevitable aggressor, whose aim, down the centuries, remained the same: to possess Istanbul and the straits. In 1925, however, cordial relations were established by Lenin and Mustafa Kemal, which endured until the signature of the Soviet-German pact of 1939. Although its treaty with the U.S.S.R. still remained in force, Turkey suspected (not without reason, as was subsequently proved) that the U.S.S.R. was bargaining with Germany at Turkey's expense. The suspicions were allayed neither by the German invasion of the Soviet Union in 1941 nor by the reaffirmation, on Aug. 10, 1941, by Great Britain and the U.S.S.R. of their fidelity to the Montreux convention.

The estrangement was no less pronounced on the Soviet side since Turkey continued to maintain its attitude of nonbelligerency, keeping the straits closed to Soviet and Allied warships. At the same time the activities of the Turkish Pan-Turanian party, which held irredentist views concerning Russian Turkistan, where there were as many Turks as in Turkey itself, had caused annoyance in Moscow. Thus the ancient hostility was revived, and with it the ambition—dormant since the Russian Revolution—of gaining control over the straits Early in 1945 Moscow launched a war of nerves against Turkey, which was not mitigated by Turkey's belated declaration of war against Germany. The subsequent denunciation, therefore, by the Soviet government in March 1945 of the Turko-Soviet treaty of friendship (due to expire on Dec. 17, 1945) did not come altogether as a surprise in Ankara. This was followed by a Soviet demand: (1) for a revision of the Montreux convention of 1936 which would permit the U.S.S.R. to share in the defense of the straits and (2) for the return of the old Turkish provinces of Kars and Ardahan, which had been annexed by Russia in 1878 and ceded back to Turkey by Lenin.

These demands were clarified by exchanges of notes in which the Soviet government proposed: (1) that the straits should always be open for the passage of merchant vessels of all countries, (2) that they should always be open for the passage of warships of the Black sea powers only; (3) that the passage of warships of non-Black sea powers should not be admitted, except in special cases; (4) that the regime of the straits should be the joint responsibility of the Black sea powers with Turkey and (5) that the defense of the straits should be carried out jointly by Turkey and the U.S.S.R. Turkey intimated in its replies that it might agree to the first three proposals, but pointed out that the regime of the straits was governed by the Montreux convention, which could not be revised except by its signatories. It refused to consider the suggestion that the U.S.S.R. be allowed to share in the defense of the straits, pointing out that this would mean granting bases on Turkish territory to a foreign power, which would be an infringement of Turkish sovereignty and a menace to its independence. Great Britain supported Turkey, as in the past, on this issue, and British support was strengthened by that of the United States, which thenceforth took the lead in the support of Turkey.

The visit in the summer of 1946 of the battleship "Missouri" to Istanbul aroused enthusiasm in Turkey and was followed by visits of successive squadrons of U.S. warships. These fleet movements were unmistakable hints to the U.S.S.R. that the United States would not tolerate any offensive move against Turkey, a cosignatory with the U.S.S.R. of the charter of the United Nations. On March 12, 1947, Pres. Harry S. Truman, in a special message to congress, recommended the employment of U.S. funds and military and civil equipment to assure the independence and economic stability of Turkey. Thereafter the question of the straits and the Soviet demand for Turkish territory were dropped by Moscow. The war of nerves, however, continued, forcing the Turks to keep their army mobilized, a precaution which Moscow denounced as warmongering.

From 1947 the United States pursued, without interruption, a policy of full support for Turkey's military, naval and economic strength. War material of every kind poured into Turkey, taxing to the utmost the latter's ability to handle it. Important naval and military missions arrived from the United States, and U.S. experts were soon studying and preparing plans for the development of Turkey's agriculture, irrigation, coal, oil, banking, transport system, education, electrification and foreign trade. By 1950 work had begun on a number of schemes, and equipment of every kind for Turkey's economic development had begun to arrive. In addition hundreds of U.S. technicians were engaged and hundreds of Turks went to the U.S. to receive military or technical instruction. In the spring of 1948 military aid alone was stated to have reached the value of $1,000,000,000.

Meanwhile Turkey's relations with Great Britain remained cordial; Turkish leaders stated on many occasions that the British alliance was the cornerstone of its foreign policy. Moreover, early in 1949 the French foreign minister assured the Turkish government that France regarded the Anglo-Franco-Turkish treaty of alliance of 1939 as still in force. The statement was received with great satisfaction in Turkey. It was felt that with the support of the United States, Great Britain and France, Turkey was reasonably secure against possible Soviet aggression.

On Aug. 9, 1949, Turkey and Greece were invited by the committee of ministers to join the Council of Europe. Turkey was alloted eight seats in the consultative assembly.

The collapse of the Balkan entente and the ineffectiveness of the Saadabad pact with Iran, Iraq and Afghanistan, as well as the in-

terest manifested by the Soviet Union in Arab affairs, directed the attention of Turkey's leaders to the importance of closer relations with the Arab states. Relations with Egypt were already cordial and new treaties of commerce and friendship were signed with Iraq in 1946 and with Jordan in 1947. At mid-century the question of Hatay impeded the establishment of friendly relations with Syria and Lebanon.

Since the end of the World War II trade with Italy had steadily increased; and March 24, 1950, Turkey signed a treaty of friendship and conciliation with the Italian republic. Commercial relations with Germany were also rapidly restored.

Turkey early announced its decision to send a brigade to support the army of the United Nations in the Korean war. Turkish troops landed at Pusan in Oct. 1950 and distinguished themselves in the fighting against the Chinese at Kunuri in November.

In Sept. 1951 the council of the North Atlantic Treaty organization, meeting in Ottawa, invited Turkey and Greece to join it. The agreement of all other members of the organization was obtained and the Turkish parliament ratified the treaty on Feb. 18, 1952. (A. A. A.; A. H. L.; A. C. Es.)

Population.—The origins of the modern inhabitants of Turkey remain somewhat obscure, but in spite of many invasions it appears that the physical types found in the country have changed very little in the last 4,000 years. The earliest invaders probably came from the Eurasian steppes around the Black and Caspian seas. The Hittite empire was established in Mesopotamia and in Anatolia by 1800 B.C., and the Turks of today take great pride in their Hittite ancestry. The Hittite empire on its fall gave place to Phrygian invaders and to refugees from Greece, who overran western Anatolia. They in turn were followed by the Persians, by the Macedonians under Alexander, by Celtic tribes from the middle Danube (Galatians), by the Romans, by the Arabs (Saracens) and, finally, by the Seljuk Turks. The Seljuks themselves were of mixed descent and probably brought with them Mongol elements.

The history of the country is reflected in the variety of types found in modern Turkey, though generally the people are muscular and well-built, round-headed, with high cheekbones, brown eyes, square jaws and large somewhat aquiline noses. The majority has Mediterranean colouring, but there is a fairer strain. It was estimated that the present people of Anatolia owe about 75% of their ancestry to the original inhabitants and 25% to the Seljuk Turks

The Kurds, somewhat scattered but living mainly in the eastern and southeastern provinces, are differentiated from the rest of the people by their height (average 5 ft. 7 in.) and very long heads and by the high proportion of them with fair hair and blue eyes.

The *growth of the population* of the republic as shown by census figures is given in Table II, the density in Table III.

Total	13,648,270	16,158,018	18,790,174*	20,934,670

*9,446,580 male, 9,343,594 female.

TABLE III.—*Density (per square mile) of Population*

Year	1927	1935	1940	1945	1950
European Turkey	124	137	168	165	170
Anatolia	44	52	57	59	67
All Turkey	46	54	59	62	70

The greater part of the population lives near the coast, where agricultural activity is most intense and where the trading centres are There the density varies from 75 to 100 per square mile. In the central plateau and in the mountains of eastern Turkey, the *density* is from 1 to 25 per square mile. On the edge of the plateau, in western Turkey and in the southern coastlands the density varies from 25 to 75 per square mile.

The urban population in 1945 amounted to 4,687,102, of which 37% lived in the ten principal towns. These were (1950 pop. in parentheses). Istanbul, 860,558 inhabitants (1,000,022); Ankara, 226,712 (286,781), Smyrna, 198,396 (230,508); Adana, 100,780 (117,799); Bursa, 85,919 (100,007); Eskisehir, 80,030 (88,459); Gaziantep, 62,873 (72,743); Konya, 58,457 (64,599); Kayseri, 57,864 (65,489) and Erzurum, 50,875 (54,360).

The distribution of the population by occupational groups in 1945 is shown in Table IV.

GOVERNMENT AND ADMINISTRATION

Before the Kemalist revolution, a "Turk" was generally taken to mean a Moslem subject of the sultan. In 1924 the meaning was established in article 88 of the organic law as follows:

The people of Turkey, regardless of religion and race, are Turks as regards citizenship

The organic law, adopted on April 20, 1924, was a concise document showing the influence of U.S., French and British examples. It contained six chapters: (1) fundamental provisions; (2) legislative powers; (3) executive powers; (4) judicial powers; (5) general rights of Turkish citizens and (6) miscellaneous, containing articles relating to the administration and to the conditions for amendment of the constitution itself. Article 2 later underwent important amendments; in 1928 the provision that Islam was the religion of the state was deleted, and in 1937 the six principles of the People's Republican party (at that time the only political party)—republicanism, nationalism, state socialism (*étatisme*), sovereignty of the people, secularism and revolution—were inserted. These were regarded as fundamental principles and were accepted by all parties, though interpretation of them varied. "Nationalism" was not aggressive but looked inward with an educative

and humanitarian aim; "state socialism" was designed to build up economy and industry on a Turkish foundation and to encourage social and cultural progress; "revolution," an expression of reaction to the slow and ineffective reforms of Ottoman times, signified the will to reform methodically the life and institutions of the country. Other important modifications to the organic law were the extension of the suffrage to women (1934); the alteration in the system of voting in parliamentary elections from indirect to direct (1946), and the introduction of the secret ballot (1948). Other important provisions were: that sovereignty belongs without restriction to the nation; that the grand national assembly is the sole and real representative of the nation, on whose behalf it exercises the right of sovereignty; that the legislative authority and executive powers are concentrated and manifested in the grand national assembly and that the grand national assembly exercises its executive authority through the person of the president of the republic, elected by it, and through a council of ministers chosen by the president. Under chapter 5 it was laid down that "Every Turk is born free and lives free. Liberty consists of any action which is not detrimental to others . . All Turks are equal before the laws . . . Personal immunity, freedom of conscience, of thought, of speech and press, the right to travel, to make contracts, to work, to own and dispose of property, to meet and to associate, form part of the rights and liberties of Turkish citizens."

The assembly's term is four years, and it meets annually on November 1 without a summons; it must remain in session for at least six months every year, and the annual budget must be presented at the beginning of the session. The functions of the assembly include: the making, amending, interpreting and abrogation of laws; concluding treaties; declaring war; examining and ratifying laws drafted by the commission on the budget; coining money and accepting all contracts and concessions involving financial responsibility.

The president of the republic is elected by the members of the assembly from their own number for the four years of their own office He is eligible for re-election. He may preside over the assembly on ceremonial occasions and, if he deems it necessary, over the cabinet. But he may take no part in debates or cast a vote. He is bound to publish laws passed by the assembly within a period of ten days; however, he may return for reconsideration with an explanation of his reasons laws of which he does not approve, except organic and budget laws. The president is the supreme commander of the army, personifying the assembly in which the office is vested. He selects the prime minister from the members of the assembly; other ministers are chosen by the prime minister and presented to the assembly after the president's approval.

Members of the council of ministers are responsible individually and collectively to the assembly for the policy and conduct of the department of state. The prime minister decides the number of ministers (usually 15) in charge of the following departments: justice, national defense, interior, foreign affairs, finance, education, public works, economy, health and social assistance, customs and monopolies, agriculture, communications, commerce, labour and state enterprises. In addition there is a minister of state who is deputy prime minister.

The council of state is both an advisory body and a judicial authority in administrative matters. It is attached to the office of the prime minister, and its members are chosen from prominent citizens with administrative and judicial experience. It may advise on draft laws submitted to it by the government.

The country is divided into 63 provinces (*ils*, formerly *vilayets*). Provinces are divided into districts (*ilces*, formerly *kazas*) and districts into communes (*bucaks*, formerly *nahiyes*). The highest administrative official in each is the *vali*, the *kaymakam* and the *bucak muduru*. The *vali*, who is appointed by the president of the republic on the recommendation of the minister of the interior, is the chief administrative officer of the province, representing all the departments (except those of war and justice) and co-ordinating their work in his province. He corresponds directly with each ministry and has a staff of advisers, who also form an administrative council under his chairmanship. The organization of the district (*ilce*) under the *kaymakam* and of the commune (*bucak*) under the *bucak muduru* follows the same pattern. The commune comprises a number of villages each of which has a headman (*muhtar*) and a council of elders, numbering from 5 to 12, according to the size of the village. A provincial council, elected for four years, debates questions of local administration, and its resolutions have legal effect; the *vali*, who is president of the council, may however refer proposals of which he does not approve to the council of state. In every headquarters town of a province or district and in all other towns of 2,000 inhabitants or more there is a municipality (*belediye*). At the head of the municipality is the mayor (*belediye reisi*), who is assisted by an elected municipal council and a committee composed partly of officials and partly of persons chosen by the council for a year's term of office.

Justice, Police and Gendarmerie.—Under articles 8–54 of the organic law, the courts of justice were made entirely independent of the assembly and the government. The highest court is the court of cassation in Ankara, which has civil, penal, commercial and bankruptcy chambers, each divided into special sections. Each court chamber has its president; the chambers together form the quorum of the court of cassation which has its own president and forms the highest court of appeal. Lower courts are: (1) peace courts, (2) courts of first instance, (3) central criminal courts and (4) commercial courts

The most sweeping of the changes made by the revolution was the abolition of the religious courts and the Moslem Shari code and the adoption, in 1926, of the Swiss civil code, the Italian penal code and a commercial code based on several European models.

The minister of the interior is responsible for the maintenance of order and the internal security of the country. He exercises his powers through the director-general of security and the general commanding the gendarmerie and, in case of necessity, by calling on the armed forces, although a decision of the council of ministers is necessary before the army can be employed. The police are divided into three groups: administrative (prevention of crime, maintenance of law and order, etc.), in which they are under the orders of the civil authorities; judicial, in which they are under the public prosecutor and political (*i.e.*, for matters concerning the internal security of the state). In the capital the police are organized under a director-general. In the provinces the police subdivisions are attached to the *valis*, *kaymakams* or *mudurs*. A law of 1930 established the gendarmerie as a military force, administratively under the minister of the interior, which reinforces the police mainly in rural districts and is subject to the same local authorities, administrative or judicial. The gendarmerie is formed from men serving with the colours and is primarily a military formation, its training and instruction being supervised by the general staff.

Education.—Primary education is, in theory, compulsory for both sexes between the ages of 7 and 12. Among the problems of primary education at mid-20th century was the lack of teachers. Although great expansion had taken place, there was probably still a considerable number of children in the provinces receiving little or no education. The secondary schools provide a three-year course which may be followed by a three-year or four-year course at a *lycée*. Parallel with the secondary schools are the boys' technical schools, with three-year, five-year or six-year courses, where engineering, building and other trades were taught; girls' institutes giving training in home management, cooking, hygiene, etc.; and commercial schools in which general as well as commercial subjects are studied. Technical and commercial instruction may be continued in a small number of *lycées* specializing in these subjects. Evening trade schools are also provided for men and women who have not had more than a primary education; the number of these at mid-century was still small. The Istanbul technical university, reorganized in 1941, is designed to give instruction, both practical and theoretical, in engineering subjects. The course lasts four years. With it is associated a technical department, with a two-year course in civil or mechanical engineering. A technical university for Ankara was being planned by 1951. Other universities include that at Istanbul, with faculties of law,

medicine, science, letters and economics, and one at Ankara, with faculties of languages, history and geography, science and medicine and schools of law and archaeology.

An interesting and successful experiment was the establishment of village institutes (*koy enstitülari*), at which boys and girls who have had primary education are given general and vocational training designed to fit them as teachers in village schools or as farmers able to apply modern agricultural methods to their work. The rural atmosphere is maintained in these institutes and the training is severely practical. A boy returning as a village schoolmaster is expected to be able not only to teach but to build and maintain a schoolhouse of a standard pattern, if necessary.

Education is free in all government schools; but board and lodging, where this is necessary, are not always provided, though many scholarships that cover all expenses at school or university are awarded. A number of Turkish private schools exist, as well as the schools for the minorities (Greek, Armenian or Jewish) and the foreign schools, (of which the American Robert college in Istanbul is the best known). The Turkish government's insistence on the secularization of education throughout the country raised serious difficulties for the foreign schools, and some were forced to close. In 1947 the ban on religious instruction was relaxed, and Moslem schools were permitted to open, in addition to but not in replacement of the secular state schools.

The spread of education was enormously assisted after the Arabic alphabet was superseded by the modified Latin alphabet, introduced in 1928 by a nation-wide campaign in which Kemal Ataturk himself took a prominent part. At the same time efforts were made to reform the Turkish language by the substitution of pure Turkish words for Arabic or Persian words in general use. This led to some confusion and the effort was allowed to slacken.

Adult education was still much needed at mid-century. Apart from stationary and mobile schools for the illiterate, vocational and professional training schemes with day or evening classes had been developed. To help in filling the need for adult education "people's houses" (*halkevleri*) were established all over the country; activities include language and literature, fine arts, drama and history. Libraries and museums were also established.

Sports are encouraged in all schools and in the village institutes. Football, basketball, wrestling and field sports are all popular.

Table V shows the increases in the number of schools and students between 1935 and 1949, illustrating particularly the great importance attached to technical training.

Labour and Welfare.—The ministry of labour was established in 1945 to regulate relations between employers and workers, to secure a better standard of efficiency of the labour force and generally to supervise the laws relating to labour and social insurance. The first of these was passed in 1936 and was followed by the supplementary laws of 1946, 1947, 1950 and 1951 The basic law of 1936, which applied only to establishments employing ten or more persons, regulated conditions of employment (health and safety arrangements, hours of work, etc) and forbade strikes or lockouts. Of the 300,000 persons covered by this law in 1949 about 74,000 were members of the 83 trade unions. The functions of the unions and employers' associations were defined by law. Any trade union representing the majority of workers in an industry could, on the written demand of one-fifth of the total number of workers, initiate collective bargaining with an employer. Any employer wishing to make mass dismissals had to give a month's notice to the ministry of labour.

Insurance measures were introduced in 1946 and supplemented after- [illegible]

[illegible]

TABLE V.—*Education*

Year	Number of schools	Number of students	Primary schools	Secondary schools	*Lycées*	Vocational schools	Higher schools and faculties
1935-36	6,614	770,600	6,275	191	66	44	18
1940-41	11,040	1,109,300	10,596	238	82	69	20
1945-46	14,615	1,522,400	14,010	252	83	196	31
1948-49	16,858	1,632,300	16,119	321	88	257	32

beds); religious foundations, 1 (250); provincial authorities, 54 (3,239); municipalities, 16 (1,589); various ministries, 6 (860), foreign organizations, 10 (683); minority communities, 5 (749); charitable associations, 3 (326); private, 20 (503); and state-controlled factories, 23 (809).

Campaigns against malaria, trachoma and syphilis were vigorously conducted with considerable success. Great efforts were made to reduce the very high infant-mortality rate (120-350 per 1,000 live births in 1918), but the shortage of nurses and midwives made this difficult.

Each province (*il*) has a director of health services, with doctors in the districts (*ilces*) and communes (*bucaks*) who not only supervise sanitary conditions but, in the *bucaks*, are the local medical practitioners, giving free advice and treatment Each large town has its own municipal health organization The state-controlled factories, moreover, have their own hospitals and staff

Finance.—Continuous adverse trade balances caused the value of the Turkish pound (£T or TL) to depreciate between 1923 and 1930, when the £ sterling reaching the value of £T11.00 Action by the Turkish government brought the rate to £T10.30, at which it remained until Great Britain went off the gold standard in Sept. 1931. From that date the Turkish pound was kept pegged to the French franc at 12.06 fr per £T1. In 1936 the franc was devalued, and the Central bank, which had started operations in 1931, maintained the old gold parity and exchange rates so that the pound sterling equalled £T5 20. This, however, was only a theoretical rate, as exports enjoyed a premium and imports suffered a surcharge. This situation was regulated in 1946, when the Turkish currency was devalued When sterling was devalued in 1949, the old rate with the dollar was retained (*See* Table VI.)

TABLE VI —*Exchange Rates of the Turkish Pound*

	1930	1931	1936	1938	1945	1946	1947	1949 (Sept)	1952
£ sterling	11 00	10.30	5 20	6.16	6 21	7.24	11 33	7 90	7 84
Dollar				1 26	1 31	1 81	2.81	2.80	2 82

Reduction in imports and competitive buying by the belligerents during World War II resulted in a considerable rise in Turkey's gold reserves and foreign-exchange assets between 1939 and 1945. But when manufactured goods became more easily available and exports were artificially restricted, these balances were rapidly dissipated. The Marshall plan aid came to Turkey's rescue (1948), and further substantial assistance was given under the European Recovery plan, as well as both financial and technical help from the U S. under the auspices of the Economic Co-operation administration.

The state budget and those of the para-statal bodies (state railways, steamship lines, etc), and of the state-owned mining and industrial enterprises may be said to interlock in so much as some are subsidized or subsidize others. The final accounts of state finances showed deficits in all except two years between 1936 and 1950-51; with the exception of the Monopolies administration (tobacco and alcoholic liquors), deficits were also shown by the state-owned undertakings. The monopolies' profits could be regarded as the equivalent of excise duties in other countries. The financing of deficits was difficult since there was no organized capital market and the public became unwilling to subscribe to internal loans. In 1951, when 37% of the revenue was derived from direct taxes and 56.7% from indirect taxes, the government promised to do its best to improve the state of affairs. The reformed income tax laws that came into force in 1950 had, moreover, failed to provide the expected amount of revenue because, it was believed, of evasion and false returns. (*See* Table VII)

Table VIII shows the more important departments' expenditures

was transferred to the territories then detached from the Ottoman empire. Turkey remained responsible for a sum of £T84,590,000. Agreements with the bondholders were revised in Turkey's favour in 1928, 1933 and 1936, and the Turkish government assumed the liabilities and took over the management of the debt in 1940. Table IX includes this liability but not the debt of the state industrial organization, which amounted to £T334,200,000 in 1948 and £T266,700,000 in 1949.

Source. Turkish ministry of finance, *Overseas Economic Survey* (1951).

Communications.—*Railways.*—Before the constitution of the republic, Turkey was badly served by railways, nearly all of which were owned by foreign companies; their total length was 2,536 mi. The republican government put in hand a program of extensions which added 1,238 mi. in its first ten years. By the end of 1949 517 mi. of line had been transferred to the state by conventions and 1,000 mi. of 2,000 mi had been bought from foreign companies and 2,250 mi. had been constructed by the government since 1923, bringing the total length of lines to 4,767 mi. During World War II the rate of construction had been slowed down because of rising costs and difficulties in the supply of materials. In 1947 a 15-yr. plan was worked out under which it was intended to add a further 1,435 mi. to the system between 1950 and 1965. The directorate-general of the Turkish state railways and ports (*Devlet Demir Yollari ve limanlari*) operated at mid-century under the general control of the ministry of communications. It was self-supporting as far as current operations were concerned. Its revenue more than covered its current expenditure, but it was burdened with heavy internal and external debt, roughly half of which represented the payment for foreign concessions nationalized.

Roads.—In 1923 the roads, surfaced and unsurfaced, amounted to only 8,073 mi. During the next 15 years an average of £T7,300,000 a year was spent on building and reconstruction. By 1935 the total length had almost been doubled, and in 1939 a comprehensive program was announced under which 19,872 mi. of modern roads were to be built in ten years at a cost of £T120,000,000. World War II put a stop to this work, and development was slow until, in 1948, an agreement was signed between the American Mission for Aid to Turkey and the ministry of public works, in which a nine-year program for the construction, reconstruction and improvement of a national highway system of 13,437 mi. of all-weather roads was announced. By the end of 1949 661 mi of new construction had been completed; the total of macadamized road at the same time was 9,578 mi. The following highways were included in this program: Edirne-Istanbul-Ankara-Adana-Antioch-Yayladagi (878 mi.); Edirne-Saray-Istanbul-Izmit (Kocaeli)-Duzce-Eregli-Safranbolu-Kastamonu (Kastamuni)-Kabili-Samsun-Hopa-Kars (1,293 mi.); Canakkale (Chanak)-Bursa-Eskisehir-Ankara-Yozgat-Sivas-Erzincan-Karakose (1,362 mi.); and Izmir (Smyrna)-Aydin-Mugla-Antalya-Icel-Adana-Gaziantep-Urfa (Edessa)-Diarbekr-Bitlis-Van-Hakkari (1,528 mi.).

Ports and Shipping.—The railway administration was made responsible for the maintenance and exploitation of the terminal ports of Haydarpasa (Istanbul), Derince, Iskenderun (Alexandretta), Mersin, Samsun, Alsancak (Smyrna), part of the quays at Sirkeci (Istanbul) and the quays at Bandirma and Edremit. Istanbul, which handles 70% of Turkey's foreign trade, suffered from congestion at mid-century and improvements to it were among the projects submitted to the International Bank of Reconstruction and Development.

The Turkish merchant navy in 1950 included 40 passenger ships, 3 tankers and 14 cargo ships owned by the state shipping administration and 60 cargo ships in private ownership; total gross tonnage was 322,682. There were also state-owned ferryboats and auxiliary craft. In 1951 the state shipping lines were converted into a semicommercial corporation called the Maritime bank in which the government retained 53% of the shares.

Civil Aviation.—The state airlines operated 19 airfields at mid-century, with the main traffic centres at Ankara, Istanbul, Smyrna, Afyon and Elazig. Civil air agreements were concluded by Turkey with the United States, Sweden, France, Italy, Denmark, Czechoslovakia, Greece, Netherlands, Great Britain, Brazil and Iran. In addition to internal services, the state airlines established a service on the route Istanbul-Ankara-Nicosia-Beirut.

Posts, Telegraphs and Telephones.—The republican administration claimed that the number of post and telegraph offices in Turkey increased from 688 to 1,679 by 1948. Work on the expansion of telephone and telegraph interurban services was begun in 1947, and a wide-scale training program to fit the staff to cope with new technical problems was initiated. In 1934 broadcasting was taken over by the government from a semiofficial body; its supervision being vested in the director-general of the press, publication and tourism Three transmitters were in operation in 1951. Radio Turkey (Ankara), 120 kw., 182 kc. per second; Radio Ankara, 20 kw., 9,465 kc. per second; and Radio Istanbul 150 kw , 704 kc. per second. Programs in Urdu, Serbian, Arabic, Persian, German, Bulgarian, Greek, Rumanian, Polish, French and English were being broadcast from Ankara. Receivers registered in Turkey numbered 263,165 in 1949, compared with 38,498 in 1938. The cost of broadcasting was met entirely from a grant out of the budget allocation for the directorate-general of the press.

ECONOMICS

Agriculture and Forests.—Agriculture is Turkey's most important industry, providing a livelihood for 75–80% of the population, largely on small farms. For some years the republic spent relatively small sums on the scientific development of agriculture in comparison with its expenditure on industrial projects, but after World War II great efforts were made to improve technique, promote irrigation, conserve the soil, breed better cattle and extend transport facilities.

The principal crops are cereals, cotton, tobacco, fruit, (fresh and dried), nuts, oilseeds, olives, pulses and vegetables. Tables X, XI, XII and XIII give approximate data on the first four of these crops.

Besides grapes and figs (*see* Table XIII), other fruits, *i e* , citrus fruit, apples, pears, quinces, peaches, apricots, melons and strawberries, grow in abundance, but no export trade had been developed by mid-century and statistics of production were not made available

Olives are grown in western Anatolia and in the south. Turkey ranked fifth among the olive-growing countries at mid-century but did not export any significant quantity either of fruit or oil.

Hazelnuts, walnuts, pistachios and almonds are grown but only the hazelnut is exported in any quantity. It is grown on the Black sea coast near Samsun and the crop averages about 30,000 tons of shelled nuts a year. About 2,000 tons of pistachios are exported annually.

The principal crops of oilseeds are sunflower, cotton, sesame, linseed and poppy. Estimated production in 1949 was about 360,000 tons, of which nearly one-half was cottonseed (*see* Table XI).

Vetches of various kinds were coming into increased use for fodder at mid-century. Haricot and broad beans, lentils and chickpeas are plentiful, and potatoes are widely grown Onions, garlic, leeks, eggplants, artichokes, tomatoes, cabbage, lettuce, cucumbers, carrots and turnips are extensively grown for local consumption

Rice	30	60	24	55	24	61	27	58

*Cereals are grown principally in the central plateau, except maize, grown on the Black sea coast, and rice, in the Adana-Iskenderun district and in southeastern Thrace.

TABLE XI.—*Cotton: Area Sown and Yield**

Year	1934–38	1946	1947	1948	1949
Thousand hectares	268	247	206	297	358
Thousand tons. cotton	60	59	51	58	105
cottonseed.	107	111	94	111	176

*The cultivation of cotton is concentrated in the Aegean and Adana regions.

TABLE XII.—*Tobacco: Area Sown and Yield**

Year	1934–38	1946	1947	1948	1949
Thousand hectares	79	123	132	106	124
Thousand tons	61	98	102	74	98

*Most of the tobacco is grown in the Aegean district but important areas are also on the Marmara coast and on the Black sea coast near Samsun.

TABLE XIII —*Dried Fruit: Tonnage and Value Exported**

Year	Sultanas		Figs	
	Tons	Value in £T	Tons	Value in £T
1936–39	61,000	10,000,000	33,000	4,000,000
1945	30,880	19,000,000	14,148	6,000,000
1946	60,323	36,000,000	26,776	28,000,000
1947	31,018	27,000,000	23,094	15,000,000
1948	29,021	26,000,000	26,224	14,000,000
1949	63,586	46,000,000	17,377	11,000,000

*No reliable figures of total production were available in the early 1950s. The white seedless grape, *sultanya*, grows in the valleys in western Anatolia. The best figs are grown in the Aydin district of western Anatolia and near Izmir (Smyrna).

Tea growing was started in 1931 in the Rize district on the Black sea coast. There were 1,500 ac. under cultivation in 1949 and it was planned to expand this to 11,000 ac. The factory at Rize, a government monopoly, produced 160 tons of tea in 1949.

The forests of Turkey, according to official statistics published in 1944, occupied 35,400 sq.mi. *i.e.*, about one-eighth of the total area of the country (the alternative figure given of 40,500 sq mi was probably exaggerated). Forests, however, had been diminishing for many years as a result of neglect, indiscriminate cutting and destruction by goats. At mid-century a scheme of reafforestation was being carried out by which it was intended to increase the forest area to about 60,000 sq.mi. The principal species are pine and fir (western Anatolia and the Black sea coast), beech (Marmara region, western Anatolia and Black sea coast) cedar (southern coastlands) and oak, valonea oak grows only in western Anatolia. There are fringes of oak scrub on the Black sea, Marmara and Mediterranean coasts.

Livestock and Fisheries.—Except for a few state farms the care and feeding of livestock remained poor at mid-century, and a large proportion of the grazing land (artificial pasture being almost non-existent) was bad. Sheep and goats are the most common stock since they can exist on poor grazing. The sheep are mostly of the Karaman, fat-tailed variety, there are large numbers of ordinary goats, and the Angora goat, which thrives on dry, elevated plateaus, is bred extensively. Cattle are still largely used as draught animals, the Turkish gray cattle being especially suitable for this. Crossbreeding with Swiss cattle was being tried after World War II. The horses are mainly of Turkish origin, but breeding from Hungarian stock was introduced on a small scale; the five government stud farms breed mostly English thoroughbred and Arab race horses. There are large numbers of fowls.

No official census was taken before 1948 (*see* Table XIV).

TABLE XIV —*Livestock*

	Estimate 1945	Census 1948	Census 1949
Sheep	23,400,000	25,800,000	23,000,000*
Goats	12,200,000	14,600,000	13,400,000*
Goats, Angora	4,000,000	3,200,000	3,200,000*
Horses	970,000	1,100,000	1,120,000
Donkeys	1,600,000	1,700,000	1,600,000
Cattle	9,800,000	10,300,000	10,300,000
Hens	17,800,000	19,000,000	20,300,000

*Heavy losses were suffered in the winter of 1948–49.

Annual production of wool probably amounted to 20,000–25,000 tons at mid-century; of mohair (from the Angora goat), about 6,000 tons. The average milk yield per animal was low; except near the large towns and at the sugar factories, there was no organized dairy industry. There was a large production of yogurt and various kinds of cheese and small production of inferior butter.

The main fishing industry is in the Sea of Marmara and the Bosporus, but fishing is carried on in various forms all around the coasts. Bonito, tunny, swordfish, mackerel, herring and sardines constitute the principal catch. The only inland fishing centre is Lake Van though trout, pike, carp, eels and coarse fish are common in inland waters. About one-third of the catch of fish is consumed in the country, the remainder being exported salted, canned, dried or fresh

Mining.—Turkey's principal minerals are coal, lignite, iron, chrome, copper, manganese, lead, zinc and emery, but only coal, lignite, iron and chrome are extensively produced.

The only bituminous coalfield is around Zonguldak on the Black sea coast, about 150 mi. E. of Istanbul. Although output increased from about 700,000 metric tons in 1934 to more than 4,000,000 metric tons in 1949 it did not keep pace with the internal demand, and there was no export trade in coal. Deposits of lignite are widespread; it is most abundant in western Turkey. The principal mines worked are at Soma, Degirmisaz and Tunchlek. Other extensive coalfields, both bituminous and lignite, are known to exist but lack of transport facilities and power prevented their exploitation. Some progress was made possible by Marshall plan aid after World War II.

Industry.—The policy of *etatisme*, or state exploitation, did not necessarily involve 100% control of any particular industry. The Sumer bank was created in 1933 to take over existing industries and to found and administer new ones In 1950 it controlled 60% of the cotton textile industry; 50–55% of the woollen textile industry, 100% of the artificial fibre industry; 100% of the iron and steel industry; 100% of the paper and cellulose industry; 20–25% of the cement and firebricks industry; about 10% of the leather and shoemaking industry; and 10–20% of the gluemaking industry. The Eti bank was founded In 1935 to exploit and develop mineral resources and electrical power facilities. It acquired control of by far the largest part of the exploitation of minerals. The manufacture of tobacco and cigarettes, alcohol and alcoholic drinks, matches and salt was made a state monopoly under the General Directorate of Monopolies. The beet sugar industry was two-thirds government owned at mid-century, and was under the Sugar Monopoly organization

Textiles.—The principal cotton products of the Sumer bank and other factories are cabot, white sheetings, prints, low-grade shirtings and cambrics The "cottage industry" also produces an appreciable quantity of rough cotton fabrics woven on hand looms. The production at the Sumer bank mills in 1949 was about 93,000,000 m. In 1948 private mills produced about 64,000,000 m.

In addition to five woollen mills owned by the Sumer bank, there were nearly 40 privately-owned woollen mills, some of them very small. In 1949 the former produced 4,900,000 m. of piece goods and 4,100 tons of yarn, the latter, in 1948, produced 6,500,000 m. of cloth

The old-established silk industry at Bursa remained entirely in private hands Production in 1948 was 200 tons of yarn and 1,500,000 m. of silk fabric There was a small silk weaving industry in Istanbul. A factory for synthetic fibres, owned by the Sumer bank, produces about 360 tons of yarn every year

Iron and Steel.—The iron and steel works at Karabuk are operated on behalf of the Sumer bank The iron ore is brought by rail from Divrik (600 m away) and coal from Zonguldak, but the quantity by the 1950s was still insufficient for the works to reach the production for which it was designed (*see* Table XV).

TABLE XV.—*Iron and Steel Products, Karabuk*
(In metric tons)

Year	Pig iron	Steel	Rails, plates, etc.	Cast iron pipes
1946	79,162	79,694	64,083	4,576
1947	96,504	93,983	72,073	7,308
1948	100,050	98,053	65,985	8,225
1949	112,742	101,972	68,167	10,900

A sulphuric acid plant, installed at Karabuk by a German firm during World War II, produced about 11,000 tons of acid in 1949. The raw material is imported

Paper.—The paper industry, all controlled by the Sumer bank, consisted at mid-century of two mills at Izmit with outputs of 14,000 and 16,500 tons a year By 1951 it had been decided that one of these was to be enlarged (to give an extra capacity of 4,000 tons) and that a third with an annual capacity of 8,000 tons was to be erected. All classes of paper were being made.

Cement.—Six factories with a nominal capacity of more than 400,000 tons produced 377,000 tons in 1949.

Sugar.—The Sugar Monopoly organization owned four factories at mid-century, one at Alpullu in Thrace, the others in Anatolia at Eskisehir, Usak and Turhal In 1949 they employed a staff of 375 with 887 permanent and 4,814 seasonal workers. (*See* Table XVI.)

TABLE XVI —*Sugar Production*
(In thousand metric tons)

Year	1939	1944	1945	1946	1947	1948	1949
Beet treated	628	561	552	615	589	708	818
Sugar	95	90	90	97	97	118	135
Molasses	28	22	26	26	24	29	32

Tobacco.—A state monopoly produces about 18,000 metric tons of tobacco annually (more than 80% cigarettes)

(K. C. B.)

TURKEY. Domesticated breeds of turkeys were developed from indigenous wild stocks of North America. The Ocellated turkey, an indigenous species of the Yucatan peninsula of Mexico and the adjoining territory, apparently was not domesticated and differs considerably from the species from which domesticated breeds descended. The Ocellated turkey is smaller than the wild North American species, has no breast tuft or "beard," has two extensible fleshy appendages called "leaders" on the head instead of one and brighter coloured plumage with eyed (ocel-

lated) main tail feathers. There are five subspecies of the North American wild turkey, the two most important being the Mexican subspecies indigenous to central Mexico and the subspecies indigenous to the northeastern and middlewestern parts of the United States as far west as Oklahoma and Iowa and as far north as southern Ontario in Canada.

Evidence clearly indicates that the turkey had been partially domesticated by the Indians prior to the discovery of North America in 1492. Domesticated birds of the Mexican subspecies were imported into Spain from America about 1519. From Spain domesticated stocks became distributed throughout the rest of Europe and were introduced into England between 1524 and 1541. A white variety known as the White Austrian and a Belgian parti-coloured variety known as Ronquieres were developed in Europe. In 1865 the original Mexican stock was known in England as the Cambridge Bronze, and English breeders developed a black variety known as Norfolk Blacks and a buff variety known as Fawns. Some of the domesticated English and European stocks were taken to North America by the early colonists and served as foundation strains along with wild stocks of the northeastern subspecies in the development of the six long-established varieties in North America—Bronze, Narragansett, White Holland, Bourbon Red, Black and Slate—as well as two newly established varieties, Nittany and Royal Palm.

Turkeys are raised in most countries of the world but mostly as farm flocks of limited size. In the United States, however, turkey raising on a commercial scale is a very important enterprise in some sections of the country. Flocks of several thousand birds are not uncommon.

The Bronze is the largest sized variety and is the most popular one among commercial turkey raisers in Canada and the United States. Bourbon Reds, White Hollands and Narragansetts are also kept to a considerable extent. Up to about 1930, turkey breeders attached much importance to breeding large sized turkeys; it was not uncommon for young Bronze toms to weigh as much as 25 lb. and old Bronze toms 40 lb. After 1930, however, efforts were made to reduce the size somewhat and to improve the type of market turkey especially with respect to the amount of fleshing over the breast. So-called "broad-breasted" strains were developed with a pronounced degree of fleshing over the breast. Breeding stock selected for shorter shanks also resulted in improving the type of market turkeys produced. The United States government developed a small-sized strain of white turkeys with a view toward meeting the demands of many housewives for dressed turkeys weighing about 12 to 14 lb.

For best results in growth and fleshing, turkeys are fed much the same kind of diets as growing chickens, except that turkey diets should contain relatively more protein and fibre and more of certain vitamins. A fattening diet containing a high proportion of yellow corn is fed for about one month before the birds are marketed. Well-bred stock of the Bronze variety at 24, 26, 28 and 30 weeks of age should be expected to attain average weights for both sexes of 15, 16, 17 and 18 lb. or more, respectively. Comparable weights for White Hollands, Bourbon Reds and Blacks should be at least 13, 14, 15 and 16 lb. and for the small-type variety the weights should be about 13, 14, 15 and 16 lb., respectively. Birds of the small type variety are usually ready to market about four weeks before birds of the largest sized Bronze variety. Bronze turkeys consume about 55 to 60 lb. of feed per bird up to 24 weeks and about 75 to 80 lb. per bird up to 28 weeks. The smaller sized varieties consume less feed and the small-type variety still less. On the basis of efficiency in utilization of feed or pounds of feed consumed per pound of gain in growth, the broad-breasted strains are apparently superior.

TURKEY BRIDGE, BATTLE OF, an engagement of the American Civil War which took place near Richmond, Va., on June 30, 1862. The battle of Turkey bridge was a part of the action known variously as the battle of Frazier's farm, Glendale or White Oak swamp, which was, in turn, one of the series of combats known as the Seven Days' battle (*q.v.*). The battle of Frazier's farm was, like that of the other battles during the seven day campaign, an attempt by the Confederate army to prevent the safe retreat of the Union forces under Gen. McClellan from the neighbourhood of Richmond. At Turkey bridge, located about 15 mi. S.E. of Richmond, Confederate forces under Gens. Theophilus Holmes and John B. Magruder endeavoured to turn the enemy's rear but a Union contingent under Gen. George Sykes was successful in frustrating the attempt.

TURKEY ISLAND, the name of a small island in the Detroit river, Michigan, below the city of Detroit, and formerly the name of a larger neighbouring island, now known as Fighting island. The two islands were so called by the French, who named them Isle aux Dindes (turkeys) and Petite Isle Dindes, because of the large number of birds abounding on the islands.

At the time of the Indian chief Pontiac's siege of Detroit (1763–64), the two islands had great strategic importance because the Indians were able to use them to ambush ships carrying supplies up the Detroit river to the beleaguered garrison. On June 23, 1763, an attack by Indians, who had entrenched themselves on the smaller of the two islands, was repulsed by a ship whose captain had concealed the larger part of its crew below the decks, hoping thereby to encourage the Indians to attack the vessel openly. His ruse succeeded when the Indians, under cover of night, canoed close enough to the ship so that when its guns opened fire, many of the attackers were killed or wounded. The ship was then shortly able to carry its cargo of reinforcements and supplies to the fort. The larger island was used by the Indians as a base for attacking the schooner "Gladwin" on Sept. 4, 1763, when 350 Indians boarded the ship with a crew of 12 men. Only the courage of the first mate, who gave the order to blow up the ship, saved the crew and its important cargo, for one of the Indians, understanding the command, warned his companions to abandon the ship, which then sailed safely on to Detroit.

TURKHEIM, BATTLE OF. At the end of 1674 the imperial army under Bournonville had crossed the Rhine at Strasbourg and invaded Alsace in order to check the aggressions of Louis XIV (*see* DUTCH WARS and TURENNE, HENRI DE LA TOUR D'AUVERGNE). After an indecisive battle at Enzheim, Turenne, the French commander, withdrew northwards as if for the defense of Lorraine; thereupon the imperialists spread themselves into winter quarters over S. Alsace.

This was exactly what Turenne wanted. He re-entered Alsace from the south at Belfort, taking the imperialists by surprise. A rapid thrust at Strasbourg might have been decisive, but the long march had exhausted Turenne's men; and when at last he did move northwards, the allies had had time to concentrate their army, 50,000 strong, in a formidable position between Colmar and Turkheim. Turenne, with only 35,000 men, decided to manoeuvre his enemy out of position. Giving half his force to the Comte de Lorge, he ordered him to demonstrate particularly against the town of Colmar, on their left. As he had hoped, the imperialists at once began to move troops from their right and centre for the defense of Colmar, whereupon Turenne, who had moved the rest of his army close up to the enemy's right, sent Foucault forward with 12 battalions and some cavalry and guns to cross the stream near its junction with the Fecht. On Jan. 5, 1675, Foucault attacked and brilliantly forced the imperial right back upon their centre. As Turenne had anticipated, the imperialists, fearful that their flank was turned, fell back upon Strasbourg. The losses were unimportant; but the battle was decisive, Alsace being cleared of its invaders.

TURKI, strictly speaking an Arabic or Persian adjective formed from Turk, used by European writers in two rather different senses. (1) It is applied to tribes or languages which are Turkish as opposed to Aryan, Semitic, etc. (2) It is used as the special designation of the tribes and languages of Kashgaria and eastern Turkistan. (*See* TURKS.)

TURKI LANGUAGE. The dialects of the Turkish language may be roughly divided into four main groups, namely (1) the oriental dialects of the Altai, (2) the western dialects including Kirghiz, Bashir and the Tatar of the Volga, (3) the dialects of central Asia with which this article will deal and (4) the

southern dialects, including Turkoman, Azerbaijani, Anatolian, Crimean and modern Ottoman Turkish (Osmanli). These dialects differ in a remarkably small degree from one another. There are, however, two Turkish dialects, namely, the Yakut and the Chuvash, which, owing to their isolation, have undergone considerable modification The Central Asian dialects which are spoken from the eastern frontiers of Persia as far as Hami on the edge of the Gobi desert include Taranchi, the Turki of Hami, Aqsu, Kashgar, Yarkand, Sart, the dialect of Kokand, and the Uzbeg of Bokhara and Khiva. The literary language of Chinese Turkestan is known as Eastern Turki or Jaghatai from the name of one of the sons of Jenghiz Khan who founded a Khanate in this region at the beginning of the 13th century. The first monuments to be discovered of the ancient Turkish language were those contained in the Orkhon inscriptions dating from the 8th century which were written in a Runic character. They were known to exist in 1730, but were only deciphered in 1893 by the Danish scholar Vilhelm Thomsen. Since then a vast manuscript literature in a similar language, both in Runic and in other alphabets notably the Uighur (derived through Sogdian from the Aramaic) has been rescued from under the sands of Central Asia. (Documents have also been found in Estrangelo [two forms], Brahmi, and even Tibetan.) When the Uighur alphabet was introduced is not exactly known, but it must, at a later stage, have overlapped with the Runic alphabet which was certainly employed in the 6th century of our era. Although with the submission and consequent conversion of Chinese Turkestan to Islam a vast number of Arabic words were introduced into the Turki language, the number of these was far smaller than was the case with Osmanli Turkish, and consequently old roots have been preserved in Turki which have almost entirely disappeared from the westerly dialects. The Uighur alphabet was still in use in the 14th century and mss have been found dating from the 15th century, but owing to the influence of the Arabian culture, it was finally discarded in favour of the Arabic alphabet. The Turki language spoken to-day from Yarkand to Hami is practically identical with the Turki of the 10th century. Down to the 14th century very few literary works were produced in Turki, but in the 15th, 16th and 17th centuries there appeared a large number of distinguished writers in that language among whom may be mentioned the great poet and patron of poets Mir Ali Shir Navai, the Sultan Babur and the historian Abul-Gazi Bahadur Khan. The characteristics of the Turkish languages have been described elsewhere. (*See* TURKISH LANGUAGE AND LITERATURE.) Turki is rich in verbal affixes which modify the root meanings. Shaw cites an example which illustrates the manner in which these affixes may be multiplied in a single word—in *Birlishturalmaidurman. Birmaq* is "to give"; *almaq* is "to take"; *biralmaq* is "to be able to give"; *biril* is "to be given"; *birilish* is "to be given to one another"; *birilishtur* is "to cause to be given to one another"; *mai* is the negative; *dur* is the present tense; *man* indicates 1st person singular. The whole thus means "I am unable to cause (them) to be given to each other."

BIBLIOGRAPHY.—R. B. Shaw, *Sketch of the Turki language as spoken in Eastern Turkistan.* (Part I., Grammar. Part II., Vocabulary. Journal of the Asiatic Society of Bengal, Vol. XLVI., Part I., pp. 242–368, Vol. XLVII., Part 1, Extra No. 1. Calcutta, 1877–80); G. Raquette, *Eastern Turki grammar . . . with vocabulary* (Mitteilungen des Seminars für Orientalische Sprachen zu Berlin, Zweite Abteilung, Jahrgang XV., pp. 121–183, XVI., pp. 123–211, XVII., 170–232. Berlin, 1912–14); G. Raquette, *English-Turki Dictionary* (Lund, Leipzig, 1927).

TURKISH LANGUAGE AND LITERATURE. Turkish, now generally understood as referring to the Osmanli or Ottoman Turkish speech of Europe and Asia Minor, is correctly the name of a family of tongues. The Turks were known to China in the 6th century A.D., and the Turkish inscriptions from the Orkhon river district in northern Asia bear dates from before the middle of the 8th century. The best known divisions of the Turks are the Uigurs, the Seljuks, and the Osmanlis. The last-named took Constantinople in 1453 and set up the Ottoman empire. (*See* TURKEY.)

The root of the name is *türk*, meaning "power" (or, as some authorities have it "to arrive at maturity"). The name is found in many languages from China to the Caucasus, but was not used by the Osmanli Turks until the beginning of this century. The Turkish languages are spoken over 140 degrees of longitude, from Macedonia to Siberia, and are characterized by a remarkable homogeneity. These languages are everywhere easily identifiable and leave ineffaceable marks on surrounding tongues (*e.g.*, in Mongolia and Siberia). The Asiatic Turks were at different periods decidedly forceful and their languages made attacks on other speech systems, analogous to those physical assaults made by the Turks on surrounding peoples.

A prominent feature of the Turkish languages is the vocalic harmony (prevailing throughout the family) upon the eight vowels, *ä, i, ö, ü; a, i, o, u.* The Turkish tongues are sweet-sounding and a comprehensive scheme of vowel-attractions governs the euphonic interests of the family. Nouns are declined and compounds can be built up by adding suffix to suffix: from *chal-(mak)*, "play a musical instrument" *chal-gi*, "a musical instrument"; *chal-gi-ji* "a musician," and with *-lär* (a sign of the plur.), *chal-gi-ji-lär*, "musicians." This building up from a stem is seen to perfection in the verb. The declension of nouns now comprises genitive, dative, accusative, locative, and ablative, although in earlier times there were other cases The plural (marked by the suffixes *-lär, -tär, -där,* and *-när*) is not invariably used: bir tavuk satmak, "to sell $\left\{\begin{matrix}\text{a}\\\text{one}\end{matrix}\right\}$ hen," *tavuk satmak*, "to sell hens." The copula is frequently omitted, in which event the order of words reveals the sense: *oglan öksüz* (lit. "boy orphan"), the boy is an orphan, and *öksüz oglan*, "a boy orphan."

The usual copula in the Turkish languages is the aorist of *durmak*, "to stand up." "The boy is an orphan" with the copula expressed would be *oglan öksüz tur-ur.* The construction of the sentence is accomplished by use of pronouns both before and after the predicate in accordance with the following table. (In the post-predicate position the pronoun is merely an enclitic.)

Verb and Pronoun Prefixes and Suffixes

Number and person.	Independent personal pronouns.	Copula suffix	Imperative suffix.	Possessive suffix.
Singular				
1st. pers.	*ban, man, mn*	*-ban, -van -man, -min, etc.*	*-ay, -ayin* *-eyin*, etc.	*-m*
2nd pers	*san, sin*	*-sin*	*-kil*	*-ng*
3rd pers.	*ol, ul*	*-durur, -dir*	*-sin, zin*	*-(s)i, -i*
Plural				
1st pers.	*biz, bis*	*-biz, bis*	*alim*	*-biz*
2nd pers.	*siz, sizler*	*-siz, -sizler*	*-iniz, -igiz*	*-ngiz*
3rd pers.	*olar, ular*	*durur, dirlar*	*-sin, -sinlar*	*-lari*

Suffixes to the general verb are of two kinds, (*a*) those forming nouns of action (*tran*), or in Osmanli *-dik* and (*b*) predicative suffixes which form other tenses or moods of the verb. These are added to the base, *e.g.*, from *atmak* (to throw), base *at-*+suffix *-in* or *-iniz* gives the imperative *atin, atiniz*, "throw!" Frequently, however, the base alone is used as an imperative and, except in its written form, the Turkish language in whatever dialect it is found is far from stable.

The Turkish numeral system is decimal. It is nearly, but not quite, uniform throughout the languages; it is possible that the parent idiom had not developed a complete system before the break-up of the primal family. In certain cases the colloquial has borrowed one or two number-names from surrounding peoples. The Osmanli Turkish numerals are:

1, *bir*, 2 *iki*, 3 *uch*, 4 *dört*, 5 *besh*, 6 *alti*, 7 *yedi*, 8 *sekiz*, 9 *doquz*, 10 *on*. Eleven is *on bir*, and so regularly to 20, which is *yirmi*; 30 *otuz*; 40 *kerk*; 50 *elli*; 60 *almish*; 70 *yetmish*, and so regularly to 100 (*yuz*). One thousand is *bin*.

The general outlines of the language have remained unchanged throughout the centuries, but in details there are wide differences between the languages of the different localities. The modern Ottoman (Osmanli) Turkish differs very widely from the Turkish tongues of northern Asia. It is much more harmonious to the

ear and much simpler in grammatical structure. It is a difficult task to trace the development of written Turkish from the *kök-türk* or pseudorunic script of the Orkhon regions through the Uigur script of Mongolia and Turkestan to the modern use in Turkey and central Asia of the Arabic script adapted to Turkish needs. For Turkish has used several different scripts, writing in Syriac characters (*Estrangelo*) and a modified form of this script called Manichaean, in Brahmi, in Tibetan, in Armenian, Greek and Hebrew The most modern development is the decision of the decree of the Turkish government in 1928 that the Roman alphabet should be universally substituted for the Arabic script.

LITERATURE

During the rule of the Ottoman Sultans the Turks gave little sign of literary inventiveness and the two great schools, the old and the new, into which we may divide their literature were closely modelled, the one after the classics of Persia and the other after those of modern Europe, and more especially of France. The last 30 years have seen a steady development of the new school which, from being at first imitative or adaptive, has now struck out a line of its own Turkish literature has not however yet had time to manifest its reaction to recent drastic political and religious changes. Its most modern writers all belong to the period preceding the rise of Mustafa Kemal Pasha, and even the most advanced thinkers among Turkey's men of letters have never ventured under former régimes even to hint at such reforms as have been carried out by the order of one man. The old school may be conveniently divided into three periods, which may be termed respectively the pre-classical, the classical and the post-classical. Of these the first extends from the early days of the empire to the accession of Suleimān I., 1301–1520 (700–926); the second from that event to the accession of Maḥmūd I, 1520–1730 (926–1143); and the third from that date to the accession of 'Abd-ul-'Aziz, 1730–1861 (1143–1277).

The Pre-classical Period.—The works of the old school in all its periods are entirely Persian in tone, sentiment and form. Some two centuries before the arrival of the Turks in Asia Minor the Seljūḳs, then a mere horde of nomads, had overrun Persia, where they settled and adopted the civilization of the people they had subdued. Thus Persian became the language of their court and Government, and when by-and-by they pushed their conquests into Asia Minor, and founded there the Seljūḳ empire of Rūm, they carried with them their Persian culture, and diffused it among the peoples newly brought under their sway. It was among the descendants of those Persianized Seljūḳs that so-called Ottoman Turks rose to power in the middle of the 13th century (*see* TURKS). The Ottomans naturally absorbed the culture of the Seljūḳs, and an extraordinary love of precedent, apparent in all Islamic literature, was sufficient to keep their writers loyal to their early guide for centuries till at length the allegiance, though not the fashion of it, changed and, about the middle of the last century, Paris replaced Shīrāz as the shrine towards which the Ottoman scholar turned. The poetry of the old school is greatly superior to the prose.

Ottoman literature may be said to open with a few mystic lines, the work of Sultān Veled, son of Maulānā Jelāl-ud-Dīn, the author of the great Persian poem the *Mathnawī*. Sultān Veled flourished during the reign of 'Osmān I, though he did not reside in the territory under the rule of that prince. Another mystic poet of this early time was 'Āshik Pasha, who left a long poem in rhyming couplets, which is called, inappropriately enough, his *Divān*. The nocturnal expedition across the Hellespont by which Suleimān, the son of Orkhan, won Gallipoli and therewith a foothold in Europe for his race, was shared in and celebrated in verse by a Turkish noble or chieftain named Ghāzī Fāzil Sheikhī of Kermiyān, a contemporary of Moḥammed I. and Murād II., wrote a lengthy and still esteemed mesnevī on the ancient Persian romance of Khusrev and Shīrīn; and about the same time Yazijī-oghlu gave to the world a long versified history of the Prophet, the *Muḥammediya*. The writers mentioned above are the most important previous to the capture of Constantinople; but there is little literature of real merit prior to that event. The most notable prose work of this period is an old collection of stories, the *History of the Forty Vezirs*, said to have been compiled by a certain Sheikh-zāda and dedicated to Murād II. A few years after Constantinople had passed into the hands of the Ottomans, some ghazels, the work of the contemporary Tatar prince, Mīr 'Alī Shīr, who under the *nom de plume* of Nevā'ī wrote much that shows true talent and poetic feeling, found their way to the Ottoman capital, where they were seen and copied by Ahmed Pasha, one of the viziers of Moḥammed II. The poems of this statesman, though possessing little merit of their own, being for the most part translations from Nevā'ī, form one of the landmarks in the history of Ottoman literature. They set the fashion of ghazel-writing; and their appearance was the signal for a more regular cultivation of poetry and a greater attention to literary style and to refinement of language. In Sinān Pasha (d. 1420), another minister of Moḥammed the Conqueror, Ottoman prose found its first exponent of ability; he left a religious treatise entitled *Tasarru'āt* (Supplications), which, notwithstanding a too lavish employment of the resources of Persian rhetoric, is as remarkable for its clear and lucid style as for the beauty of many of the thoughts it contains Twenty-one out of the 34 sovereigns who have occupied the throne of 'Osmān have left verses, and among these Selīm I. stands as the most gifted and most original poet. The most prominent man of letters under this sovereign was the legist Kemāl Pasha-zāda, who left a romantic poem on the loves of Yūsuf and Zuleykhā, and a work entitled *Nigāristān*, which is modelled both in style and matter on the *Gulistān* of Sa'di. His contemporary, Mesīhī, whose beautiful verses on spring are perhaps better known in Europe than any other Turkish poem, deserves a passing mention.

Classical Period.—With the accession of Selīm's son, Suleimān I., the classical period begins. Fuzūlī (d. 1563), showed far more originality than any of his predecessors; for, although his work is Persian in form and in general character, he struck out a new line for himself Bāḳī (d. 1599) of Constantinople, though far from rivalling his contemporary Fuzūlī, wrote much good poetry. The Ottomans have been particularly successful with elegies; one by Bāḳī on Suleiman I. has never been surpassed. Rūhī, Lāmiī, Nev'ī, the janissary Yahya Beg, the mufti Ebu-Su'ūd and Selīm II. all won deserved distinction as poets. During the reign of Aḥmed I arose the second of the great poets of the old Ottoman school, Nef'ī of Erzerūm, who owes his pre-eminence to the brilliance of his ḳasīdas Nābī (d. 1712), who flourished under Ibrāhīm and Moḥammed IV. was a prolific author who imparted into Ottoman literature, a didactic style of ghazel-writing which was then being introduced in Persia by the poet Ṣā'ib; indeed, it is not always easy to know that his lines are intended to be Turkish. A number of poets took Nābī for their model. The glory of the classical period ending with Nedīm, dates roughly from the accession of Aḥmed I. 1603 (1012), to the deposition of Aḥmed III., 1730 (1143).

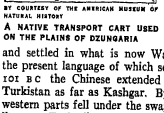
We will now glance at the prose writers of this period. Under the name of *Humāyūn Nāma* (Imperial Book) 'Alī Chelebi made a highly esteemed translation of the well-known Persian classic *Anvār-i Suheylī*, dedicating it to Suleiman I. Sa'd-ud-Dīn (d. 1599), the preceptor of Murād III., wrote a valuable history of the empire from the earliest times to the death of Selīm I. This work, the *Tāj-ut-Tevārīkh* (Crown of Chronicles), is reckoned, on account of its ornate yet clear style, one of the masterpieces of the old school, and forms the first of an unbroken series of annals

which are written, especially the later among them, with great minuteness and detail Of Sa'd-ud-Dīn's successors in the office of imperial historiographer the most remarkable for literary power is Na'īmā. His work, which extends from 1591 (1000) to 1659 (1070), contrasts strongly with that of the earlier historian, being written with great directness and lucidity, combined with much vigour and picturesqueness. Evliyā, who died during the reign of Moḥammed IV, is noted for the record which he has left of his travels in different countries. About this time Ṭash-kopri-zāda began and 'Aṭā-ullāh continued a celebrated biography of the legists and sheikhs who had flourished under the Ottoman monarchs. Ḥājī Khalīfa, frequently termed Kātib Chelebi, was one of the most famous men of letters whom Turkey has produced He died in 1658 (1068), having written a great number of learned works on history, biography, chronology, geography and other subjects. The Persianizing tendency of this school reached its highest point in the productions of Veysī, who left a *Life* of the Prophet, and of Nergisī, a miscellaneous writer of prose and verse. The first printing-press in Turkey was established by an Hungarian who had assumed the name of Ibrāhīm, and in 1728 (1141) appeared the first book printed in that country; it was Vankulī's Turkish translation of Jevheri's Arabic dictionary.

Post-classical Period.—Coming now to the post-classical period, we find among poets worthy of mention Beligh, Nevres, Ḥishmet and Sunbuli-zāda Vehbī, each of whom wrote in a style peculiar to himself. Three poets of note—Pertev, Neshet and Sheikh Ghālib—flourished under Selīm III The last-named is the fourth great poet of the old school. *Hum u 'Ashk* (Beauty and Love), as his great poem is called, is an allegorical romance full of tenderness and imaginative power. Ghālib's style is as original as that of Fuzūlī, Nef'ī or Nedīm.

When we reach the reign of Maḥmūd II., the great transition period of Ottoman history, during which the civilization of the West began to struggle in earnest with that of the East, we find the change which was coming over all things Turkish affecting literature, along with the rest, and preparing the way for the appearance of the new school The chief poets of the transition are Fāzil Beg, Wāṣif, 'Izzet Molla, Pertev Pasha, 'Ākif Pasha, and the poetesses Fitnet and Leylā. In the works of all of these, although we occasionally discern a hint of the new style, the old Persian manner is still supreme

More intimate relations with western Europe and a pretty general study of the French language and literature, together with the steady progress of the reforming tendency fairly started under Maḥmūd II., resulted in the birth of the new or modern school, whose objects are truth and simplicity. The transformation of Turkish literature and the creation of the Young Turk party were alike due to three great men, Shināsī, Kemāl and Ziyā. Shināsī's small volume of translations from various French poets appeared in 1859. In the following year he founded the first non-official journal in Turkey, in which he published in simple language articles dealing with the scientific and social questions from a modern European point of view. The first work of fiction ever translated into Turkish was Fénélon's *Télémaque* which appeared in 1862, the translator being Yusuf Kemāl Pasha. It was Ahmad Midhat who conceived the idea of writing stories depicting Turkish life and manners. The first collection of national tales appeared in 1870 In 1869 Ahmad Vefiq Pasha published translations of three of Molière's comedies, adapting the scenes and the names to suit local conditions. In 1871 appeared the first original Turkish drama, a form chosen by Abd-ul-Ḥaqq Ḥāmid for his best poetry.



The Revolution of 1908.—The turning point in Turkish national conscience came with the Revolution of 1908, which marks the beginning of a new era. With the rise of democracy there naturally was felt the need of a closer collaboration between the cultivated classes and the people who had for centuries been kept at a distance from one another for the reason that men of letters only wrote for a small circle of intellectuals in a language and on subjects which were unteIligible to the lower classes. The battle cry of the new school was *Khalqa doghru*, "towards the people," and societies were formed like the Türk Derneyi at Constantinople and the Yeni Lisanjilar at Salonica, whose object was to introduce a new literary language adapted to the understanding of the people and a literature free from foreign influences. Among the foremost workers in this new field were 'Alī Jānib, Omar Saïfeddīn, and Ziyā Gök Alp (1875–1925), the real founder of the new Turkish nationalist movement, and last but not least Mehmed Emīn, a religious poet who came of lowly stock and as spokesman for the people has enjoyed very special popularity. The new movement found its first expression in newspapers, and all the new writers began as journalists or novelists or as poets contributing to newspapers. Among those who have attained the highest rank may be mentioned the following writers: Tewfiq Fikret (d. 1915), Jenāb Shehāb ad-Dīn (b. 1877), Nigar Khanum, a distinguished poetess (1871–1918), Mehmed 'Ākif (1870–1937), Khalīd Ziyā, Aḥmad Hikmet (b. 1879), Mehmed Ka'uf (b. 1875). Ya'qub Qadri (b. 1889), Khalidé Edib Hanum (b. 1883) and Husein Jahid (b 1875) Literary criticism is notably represented by Köpruli Zadé Mohammed Fūad Bey, one of the professors of Constantinople university, an ardent scholar who is engaged in compiling a new history of the Ottoman literature. TURKISTAN, a name conventionally employed to designate the regions of Central Asia which lie between Siberia on the N. and Tibet, India and Afghanistan on the S., the western limit being the Caspian Sea and the eastern Mongolia and the Desert of Gobi. Etymologically the term is intended to indicate the regions inhabited by Turkish races. The regions called Turkistan not only contain races which do not belong to the Turk family, but exclude races which do, *e.g.*, the Turks of the Ottoman Empire. What was formerly called Eastern Turkistan is now mainly the southern portion of the Chinese province of Sinkiang (*q.v.*, see also TARIM, etc.), while the former West Turkistan is included in the Uzbek, Turkmen, Kazakstan, Kirghiz (*qq.v.*) and Tadzhik Socialist Soviet Republics (*see* TAJIK REPUBLIC).

HISTORY

Our knowledge of the history of Turkistan is very fragmentary until about the beginning of the Christian era. It may be that at a very early period East Turkistan was inhabited by an Aryan population When the Huns (Hiung-nu) occupied west and east Mongolia in 177–165 B.C. they drove before them the Yue-chi (*q.v.*), who divided into two hordes, one of which invaded the valley of the Indus, while the other met the Sacae in East Turkistan and drove them over the Tian-shan into the valley of the Ili. Thus, by the beginning of our era, the Tarim region had a mixed population of Aryans and Ural-Altaians, some being settled agriculturists and others nomads. There were also several independent cities, of which Khotan was the most important. One portion of the Aryans emigrated and settled in what is now Wakhhan (on the Pamir plateau), the present language of which seems very old. Between 120 and 101 B.C the Chinese extended their rule westwards over East Turkistan as far as Kashgar. By the end of the 5th century the western parts fell under the sway of the "White Huns" (Ephthalites, or Tochari), while the eastern parts were under Tangut (Thygun) dominion. An active trade was carried on by means of caravans, corn and silk especially being mentioned at a very early date.

A NATIVE TRANSPORT CART USED ON THE PLAINS OF DZUNGARIA

The civilization and political organization of the country were

dominated by the Chinese, but were also influenced to some extent by Graeco-Bactrian civilization, which had probably secured a footing in the country as early as the 3rd century B.C. From the 2nd century to the first half of the 7th our knowledge is slight, and is derived chiefly from the *Journeys* of the Chinese pilgrims, Fa-hien in 399–415, Song-yun and Hwei-seng in 518–521, and Hsüan-Tsang in 629–645. By this time Buddhism had reached its culminating point: in Khotan there were 100 monasteries and 5,000 monks, and the Indian sacred literature was widely diffused In the 7th century the Tibetan king, Srong-btsan, with the help of the western Turks, subjugated the western part of the Tarim basin In 712–713 the Mohammedans, after excursions into West Turkistan, invaded East Turkistan. In 790 the Tibetans were masters of East Turkistan, but later (9th century) the territory fell under the rule of an Uighur people In the 11th century Mongol hordes overran East and West Turkistan and in the 14th, Tughlak Timur accepted Islam and shifted his capital from Aksu to Kashgar His son reigned at Samarkand, but in 1380 Timur devastated Dzungaria (*q.v.*) and East Turkistan.

A SEKKOLIS MERCHANT OF SOUTHERN CHINESE TURKISTAN WEARING HIS NATIVE DRESS

Chinese Turkistan.—In the 14th and 15th centuries Bukhara and Samarkand became centres of Muslim scholarship and sent great numbers of their learned doctors to Kashgaria. Rubruquis, who visited East Turkistan in 1254, Marco Polo between 1271 and 1275; and Hoïs in 1680 all bore witness to great religious tolerance; but this entirely disappeared with the invasion of the Bukharian mullahs or Mohammedan priests. In the 17th century a powerful Kalmuck confederation arose in Dzungaria, and extended its sway over the Ili and Issyk-kul basins, having its capital on the Ili To this power or to the Kirghiz the "Whites" and "Blacks" alternately appealed in their struggles, in which Yarkand supported the latter and Kashgar the former. The Chinese entered Dzungaria in 1758, the Kalmucks fled, and Dzungaria became a Chinese province, with a military colonization of Sibos, Solons, Dahurs, Chinese criminals and Muslim Dzungars. The Chinese next re-conquered East Turkistan, marking their progress by massacres and transporting 12,500 partisans of independence to the Ili (Kulja) valley. Hereupon the dissentient khojas fled to Khokand in West Turkistan and there gathered armies of malcontents and fanatic followers of Islam. Several times they succeeded in overthrowing the Chinese rule —in 1825, in 1830 and in 1847—but their successes were never permanent. In 1867 another insurrection broke out; but a few months later the Chinese again took Kashgar. In the course of the Dzungarian outbreak of 1864 the Chinese were again expelled, and Yakub Beg became master of Kashgar in 1872. His rebellion was defeated in 1877 and a Chinese province under the name Sinkiang established in 1881. In 1932 occurred another Mohammedan rebellion, which was suppressed in 1937 by Governor Sheng Shih-tsai. Russia withdrew its control in 1943.

Old Russian Turkistan.—Soviet Central Asia comprises some part of Turkistan. Since Russia conquered Turkistan about 1865, Tashkent and Samarkand were occupied and further territory was absorbed and the whole united into Russian Turkistan. Until 1917 Russian Central Asia consisted of several territories, including the governor-generalship of Turkistan. After the revolution the Soviet Government established its power in these districts, and the khanates of Khiva and Bukhara were destroyed (1920). In the same year was set up a Peoples' Soviet Republic and the former governor-generalship of Turkistan became an Autonomous Socialist Soviet Republic within the R S F S R in 1921. In 1925 a redistribution took place and the new States of Uzbekistan, Turkmenistan and Tajikistan, together with several autonomous regions, were set up. The remaining Turkistan areas were linked with the Autonomous Kirghiz Socialist Soviet Republic

Afghan Turkistan.—Afghan Turkistan, now called the Mazar Province, the northern province of Afghanistan, is bounded on the east by Badakhshan, north by the Oxus river, north-west by Russia, and south by the Hindu Khush, the Koh-i-Baba, and the northern watershed of the Hari Rud basin, which separates it from the Herat Province. Its northern frontier was decided by the Russo-Afghan Agreement of 1873, and delineated by the Russo-Afghan Boundary Commission of 1885, which gave rise to the Panjdeh incident. With a length of some 500 m. and an average breadth, north to south, of 114 m., it comprises about 57,000 sq m., or two-ninths of the kingdom of Afghanistan. Except in the river valleys it is a poor territory, rough and mountainous towards the south, but subsiding into undulating wastes and pasture lands towards the Turkman desert, and the Oxus riverain, which is highly cultivated. The population, which is mostly settled in and around its towns and villages, is estimated at 800,000. The principal town is Mazar-i-Sharif.

The bulk of the people are of Persian and Uzbeg stock, interspersed by Mongol Hazaras and Hindus, with Turkoman tribes in the Oxus plains. Ancient Balkh or Bactriana was a province of the Achaemenian empire. About 250 B.C., Diodotus (Theodotus), governor of Bactria under the Seleucidae, declared his independence and commenced the history of the Graeco-Bactrian dynasties, which succumbed to Parthian and nomadic movements about 126 B C. Traces of the Buddhist era which succeeded remain in the rock-cut topes of Haibak. Devastated by Jenghiz Khan, it belonged to the Delhi empire for about a century, and then fell into Uzbeg hands. In the 18th century its khanates—Kunduz, Tashkurgan, Balkh with Akcha, and the four western khanates, or "Chahar Vilayet" of Saripul, Shibarghan, Andkhui and Maimana—formed part of the dominion of Ahmed Khan Durani, and so remained under his son Timur, but relapsed on Timur's death to the independent rule of various Uzbeg chiefs, dominated by Bukhara. Between 1850 and 1859 Amir Dost Muhammad re-established Afghan influence, but sovereignty over the Chahar Vilayet was disputed by Bukhara until settled in favour of Afghanistan by the Anglo-Russian Agreement of 1859.

Under the strong rule of Abdur Rahman these territories were more closely welded to Kabul, some relaxation of authority under Amir Habibullah having been made good by King Amanullah, who in 1927, together with his queen, visited Maimana, Mazar-i-Sharif, Tashkurgan and Kataghan, and by royal decree gave the district the name of the Mazar Province. In 1926, a dispute between Russia and Afghanistan regarding Urta Tagai, an island in the Oxus, was settled in favour of Afghanistan. A motor road and telegraph line linking the Mazar Province to Kabul were under construction in 1928. There are aerodromes, on the main Kabul-Tashkent air route, at Mazar-i-Sharif and Haibak. Half of Mazar-i-Sharif was destroyed by fire in June 1927. The Province is administered by a governor directly responsible to the Central Government. Schemes for the extension of cotton cultivation are under consideration. Mazar-i-Sharif is an important centre of the trade in astrakhan and furs.

TURKMEN REPUBLIC, a constituent member of the U.S.S.R., created in 1924. Area 187,142 sq.mi. Pop. (1939) 1,253,985 (urban 416,376; rural 837,609). Boundaries: west, the Caspian sea; south, Iran and Afghanistan; east, the Uzbek S.S.R.; north, Kazakstan, with the Kara-Kalpak A.S.S.R. The oasis of Khiva, incorporated in the Uzbek S.S.R., forms an island of separate territory in the northeast.

The changes in the course of the Jaxartes (Syr-darya) and the Oxus (Amu-darya), and the supposed periodical disappearance of Lake Aral, are problems in geography and it is here that we must look for a clue to the physical changes which transformed the Euro-Asiatic Mediterranean—the Aral-Caspian and Pontic basin—into a series of separate seas, and desiccated them,

powerfully influencing the distribution of flora and fauna, and centuries ago compelling the inhabitants of Western and Central Asia to enter upon their great migrations.

A mountain chain, comparable in length to the Alps, separates the deserts of the Transcaspian from the highlands of Khorasan. It begins in the Krasnovodsk peninsula of the Caspian, under the names of Kuryanyn-kary and Great Balkans, whose masses of granite and other crystalline rock reach an altitude of some 5,350 ft Farther south-east they are continued in the Little Balkans (2,000 ft.) and the Kopepet-dagh or Kopet-dagh. The latter rises steep and rugged above the flat deserts over a stretch of 600 mi. In structure it is homologous with the Caucasus chain; it appears as an outer wall of the Khorasan plateau, and is separated from it by a broad valley, which, like the Rion and Kura valley of Transcaucasia, is drained by two rivers flowing in opposite directions—the Atrek, which flows north-west into the Caspian, and the Keshef-rud, which flows to the south-east and is a tributary of the Murghab. On the other side of this valley the Alla-dagh (Aladagh) and the Binalund border-ranges (9,000 to 11,000 ft.) fringe the edge of the Khorasan plateau. Descending towards the steppe with steep stony slopes, the mountain barrier of the Kopet-dagh rises to heights of 6,000–9,000 ft. to the east of Kyzyl-arvat, while the passes which lead from the Turkmen deserts to the valleys of Khorasan are seldom as low as 3,500, and usually rise to 5,000, 6,000 and even 8,500 ft

While the Alla-dagh and Binalund border-ranges are chiefly composed of crystalline rocks and metamorphic slates, overlain by Devonian deposits, a series of more recent formations—Upper and Lower Cretaceous and Miocene—crops out in the outer wall of the Kopet-dagh. The mountains of Asia which stretch toward the north-west continued to be uplifted at a geologically recent epoch Quaternary deposits have an extensive development on its slopes, and its foothills are bordered by a girdle of loess.

The loess terrace, called Atok ("mountain base"), 10 to 20 mi. in width, is very fertile, but it will produce nothing without irrigation, and the streams flowing from the Kopet-dagh are few and scanty. The winds which impinge upon the northern slope of the mountains have been deprived of all their moisture in crossing the Kara-kum—the Black Sands of the Turkmen desert; and even such rain as falls on the Kopet-dagh (10½ in at Kyzyl-arvat) too often reaches the soil in the shape of light showers which do not penetrate it. Where the mountain streams run closer to one another, as at Geok-tepe, Ashkhabad, Lutfabad and Kaaka, the villages are more populous, and the houses are surrounded by gardens, nourished by irrigation

North of this narrow strip of irrigated land begins the desert—the Kara-kum—which extends from the mountains of Khorasan to Lake Aral and the plateau of Ust-Urt, and from the Caspian to the Amu-darya, interrupted only by the oases of Merv and Tejeñ. But the terrible shifting sands, blown into *barkhans*, or elongated hills, sometimes 50 and 60 ft in height, are accumulated chiefly in the west, where the country has more recently emerged from the sea Farther east the barkhans are more stable

The saksaul (*Anabasis ammodendron*) of the Kara-kum has been almost destroyed within the last hundred years, and occurs only sporadically, but the borders of the spaces covered with saline clay are brightened by forests of tamarisk, which are inhabited by great numbers of the desert warbler (*Atraphornis aralensis*)—a typical inhabitant of the sands—sparrows and ground-choughs (*Podoces*); the *Houbara macqueeni*, is characteristic of the region Hares and foxes, jackals and wolves, marmots, moles, hedgehogs and one species of marten live in the steppe

The Uzboi.—A feature distinctive of the Turkmen desert is the very numerous *shors*, or elongated depressions, the lower portion of which are mostly occupied with moist sand. They are obviously the relics of brackish lakes, and, like the lakes of the Kirghiz steppes, they often follow one another in quick succession, thus closely resembling river-beds. As the direction of the *shors* is generally from the higher terraces drained by the Amu-darya towards the lowlands of the Caspian, they led to the idea that the Amu-darya once flowed across the Turkmen desert towards what is now the Caspian sea. It was assumed, not only that that river (*see* Oxus) flowed into the Caspian, but that after having ceased to do so in the 7th century, its waters were again diverted to the Caspian about 1221. A chain of similar depressions was traced from Urgenj to the gap between the Great and the Little Balkans, this was marked on the maps as the Uzboi, or old bed of the Oxus. The idea of again diverting the Amu into the Caspian was thus set afloat, but the investigations of Russian engineers, especially A. E Hedroitz, A. M. Konshin, I. V. Mushketov, P. M. Lessar and Svintsov[1], went to show that the Uzboi is no river bed at all, and that no river has ever discharged its waters in that direction. The existence of an extensive lacustrine depression, now represented by the small Sary-kamysh lakes, was proved, and it was evident that this depression, having a length of more than 130 m., a width of 70 m., and a depth of 280 ft. below the present level of Lake Aral, would have to be filled by the Amu before its waters could advance farther to the south-west.

The ancient texts (of Pliny, Strabo, Ptolemy) about the Jaxartes and Oxus only become intelligible when it is admitted that, since the epoch to which they relate, the outlines of the Caspian Sea and Lake Aral have undergone notable changes, commensurate with those which are supposed to have occurred in the courses of the central Asian rivers. The desiccation of the Aral-Caspian basin proceeded with such rapidity that the shores of the Caspian cannot possibly have maintained for some twenty centuries the outlines which they exhibit at present. The general configuration of the Trans-Caspian region leaves no doubt that both the Jaxartes and the Oxus, with its former tributaries, the Murghab and the Tejeñ, *once* flowed toward the west; but the Caspian of that time was not the sea of our days; its gulfs penetrated the Turkmen steppe, and washed the base of the Ust-Urt plateau. (*See* Caspian Sea and Aral.)

Climate, etc.—The region between the Heri-rud and the Murghab is a plateau, 2,000 ft. above the sea, with hills 500 and 600 ft. high covered with sand, the spaces between being filled with loess. The Borkhut Mountains which connect the Kopet-dagh with the Sefid-kuh in Afghanistan reach 3,000 to 4,000 ft., and are cleft by the Heri-rud. Thickets of poplar and willow accompany both the Murghab and the Heri-rud. Pistachio and mulberry trees grow in isolated clumps on the hills; but there are few places available for cultivation. The climate is continental and the maximum temperature in the shade in summer varies between 105° F. at Tejend and 113° F. at Serakhs. The average summer temperature varies between 78° F. and 86° F. and winter between 34° F. at Merv and 37° F. at Termez. The rainfall is insignificant and falls in December, January, and February, summer being rainless and sultry. Thus cultivation depends entirely on irrigation.

Agriculture, etc.—The years of civil war and disorder following 1917 resulted in a sharp drop in the amount of cultivated land; irrigation canals were not cleaned or repaired and famine was widespread. As a result the number of cattle, especially sheep, was disastrously diminished, partly through slaughter and partly because herdsmen migrated into Persia and Afghanistan with their flocks. After the restoration of somewhat more settled conditions a complete revolution in social system was enforced, the old tribal holding of water rights was abolished and a new system of government control and distribution of water supply and of fertile land introduced. This involved much difficulty for the illiterate tribesmen, and conditions remained far from stable for many years, though a marked improvement began to be felt in the middle 1920s, especially in cotton growing, which was mechanized, and to which the soviet government attaches much importance. The grain and wheat crop is insufficient for the needs of the people. In the years following the revolution the number of agricultural machines increased greatly. The areas under cultivation are growing steadily. The Merv oasis (*q.v.*) is reviving, and an electric plant and new irrigation works have been constructed. Watermelons, fruits and vines are cultivated, and silkworm breeding is an ancient occupation, especially round Merv and Ashkhabad. In former times the silk was worked entirely as a peasant industry,

[1] Their original papers are printed in the *Izvestia* of the Russian Geographical Society, 1883 to 1887, also in the *Journal* of the Russian ministry of roads and communications.

but factories for large-scale silk manufacture have been constructed, particularly in Ashkhabad.

Peasant industries include the making of homespun and felt for local needs, the making of primitive agricultural implements and household goods, and the preparation of leather and silk goods. Carpet weaving is an ancient peasant industry for export, and each tribe has its own design, guarded as a secret from other tribes. The cutting off of income from carpet making during the civil war was a disaster. Horses, camels, working cattle, sheep (especially karakul), goats, asses and mules are bred. Their numbers are much below 1913 level, and sheep particularly have diminished.

Minerals.—Salt, Glauber's salt, ozokerite and naphtha exist. In pre-1914 times the output of salt was about 58,000 tons, during the civil war production ceased, but by 1926–7 it had risen to 31,600 tons. Ozokerite production in that year surpassed the previous level, reaching 700 tons as against 450 tons. The naphtha of the Ashkhabad district is little exploited, but that on Cheleken Island, which is obtained from natural fountains, yielded 450,000 tons in 1938. Rock salt is exported to Transcaucasia, Iran and Afghanistan, while Glauber's salt from the Kara-bugaz gulf is increasingly worked, and plans are under consideration for developing a superphosphate manure industry in the region. Vast resources of sulphur exist in the Kara-Kum desert north of Ashkhabad, and a recently constructed plant, reached by 155 mi. of motor road, has lessened Russia's dependence on imported sulphur. The chief town and administrative centre is Ashkhabad, the population of which increased from 13,737 in 1897 to 126,580 in 1939. Other towns are Krasnovodsk (29,600) and Merv (30,600), the last town grew rapidly after the construction of an electric power plant.

Industries.—Factory industries include cotton and wool cleaning, glass manufacture, flour milling, brewing and distilling; the preparation of dried fruit is increasing. Krasnovodsk on the Caspian is the port for the republic, its chief exports being cotton and dried fruits and its imports naphtha, timber, grain and sugar. During the civil war dredging operations ceased and the town consequently suffered. A fishing industry exists along the coast, especially near Chikishlar and Hassan-Kuli, but it is still considerably below the pre-World War I output of 10,000 tons. The Transcaspian railway is the chief means of communication, and there is a branch from Merv to Kushka on the southern frontier. The Amu-darya is difficult for steam navigation, and camel caravan is the chief trading link. Caravan routes cross the desert to the oasis of Khiva, to the various stations on the railway, to the port of Krasnovodsk and to the towns of north Iran. Much of the present income of the republic is going toward the provision of new irrigation canals and the sinking of wells. Its financial prospects are good in view of its trade with Iran and Afghanistan and the development of its mineral resources. The literacy rate among Turkomans rose from 2% in 1925, prior to the adoption of the Latin alphabet, to 61% in 1932.

Population.—The population consists of Turkmens 70.2%, Uzbeks 11.7%, Russians, Ukrainians and White Russians (chiefly in towns) 9.1%, Armenians 1%, Kirghiz 0.7%, with a few Iranians and Bokhara Jews. About half of the Turkmen tribes live in the republic, the rest being found in Iran and Afghanistan. Turkmen tribes seem to have been settled in the steppe between the Oxus (Amu-darya) and the Caspian from time immemorial and are of the west-central Turkish group. They are mentioned by Arab writers of the 10th century and were noted even at that time as much feared by their neighbours owing to their warlike disposition. Up to the time of the defeat of the Tekke tribe at Geoktepe in 1881 by the Russians, they preserved their nomadic predatory life, frequently holding Russian and Persian captives for ransom, and were perpetually engaged in tribal warfare. Since the Russian conquest many have taken to settled life, though much semi-nomadism and some pure nomadism still exists. The Yamut tribe, which formerly wandered in the steppe to the southeast of the Caspian, is now mainly occupied at the naphtha works in Cheleken Island, while other Yamuts settled as agriculturalists in Khiva in the early 19th century. The Tekkes, who were the most important tribe at the time of the Russian occupation (1881) are much scattered; many have become settled cultivators. In early times they inhabited the Mangishlak peninsula, but were driven out by the Kalmucks in 1718. Later they occupied the Akkal and Merv oases. The most ancient tribe was the Salors, who occupied the western corner of the Paropamisus range, and with whom the Arabs came in contact on their march towards the Oxus in the 7th century. Intertribal strife, and emigration to the oases and to Iran have much reduced their numbers. The Ersaris, formerly a warlike tribe of the Mangishlak peninsula, were driven by the Uzbeks to the steppe south of the Ust-Urt plateau, and settled as peaceful cultivators on the left bank of the Oxus. The building of the Transcaspian railway further altered their habits, as did the introduction of naphtha and salt working. Up to the October 1917 revolution they preserved their tribes and clans, and, though these did not disappear at once, the confiscation of water and property from the chieftains drove a sharp wedge into traditional custom and paved the way for tribal disintegration. For history of Merv oasis *see* MERV.

Lessar, *L'Ancienne jonction de l'Oxus avec la mer Caspienne* (1889); Zarudnoi (zoology) in *Bulletin de la société des naturalistes de Moscou* (1889 *seq.*); N. L. Arkhipov, *Central Asiatic Republics*, 1927 (in Russian, with a bibliography).

TURKOMANS, a group of the Iranian Turks, found in Iran, Khiva, Bokhara, in the Caucasus, and in Transcaspia, and probably numbering about 1,000,000. They include the following clans, Chaudor, Yomut, Goklan, Akhal, Merv Tekkes, Sarik, Salor and Ersari. The clan divisions are endogamous, and owing to the scarcity of women a high bride price is paid, and many of the men are unmarried. A large number of the Turkomans are nomadic horse-breeders, although some have become agriculturists. All of them are Moslems. Some of the Turkomans of the steppes appear to preserve the old Proto-Nordic physical type, but in most places they have absorbed the physical type and much of the culture of the people among whom they live. (*See* TURKS; ASIA: *Anthropology and Ethnology.*) (L. H. D. B.)

TURKS. The term Turk is purely linguistic and refers to those peoples who speak Turkic languages, having no racial sense. The Turks may be divided into two groups: a western, which includes the Osmanli, the Turks of what was formerly "Turkey in Europe and Turkey in Asia," the old Ottoman empire, and the eastern Turks, including many of the peoples of Turkistan and central Asia, as far as the river Lena. There are also Turks in the Crimea, in the Caucasus, and along the Volga. The latter are culturally entirely associated with the eastern Europeans, as are the Osmanli with the southeastern Europeans and western Asiatics, but linguistically they are associated with the western Turks (For racial history *see* ASIA: *Anthropology and Ethnology.*) The eastern Turks include the Turks of Turkistan and the Caspian steppes, who have become largely absorbed culturally and physically in the Iranian peoples, and may be conveniently called Iranian Turks, and the Turanian Turks, many of whom are called Tatars (this rather than the more familiar "Tartar" is the more correct spelling), of the Steppes, of southern Siberia, Dzungaria and northern Mongolia. The Iranian Turks include the Turkomans, the Sarts, the Taranchi or Ili Tatars, the Uzbegs, the Kalzak and the Kara Kalpak. The Turanian Turks include the Khirghiz, a somewhat loose term, the Kakut and the Siberian Tatars.

The social organization of the Turks is based on a patriarchal system of sub-clans, all related by blood, and these sub-clans are gathered together in a loose confederacy of the clan (sok).

There is no definite mode of life which can be associated with the Turks as a whole; the western Turks and most of the Iranian Turks are sedentary agriculturalists, while those eastern Turks who have been most subject to migrations and live under steppe conditions have adopted the horse culture found in its most typical form among the Mongols (*see* MONGOLIA), while the Yakuts practise the reindeer culture of eastern Asia.

The western Turks are Moslems, but to the east, in spite of the superimposition of higher religions, including formerly Nestorian Christianity, which at one time was a serious rival of Islam, much

of the animistic old religions remain, and shamanism is a specially important feature among the eastern and northern tribes.

It is almost impossible to make any generalized statement about the Turks; their most potent bond is that of language, they have no uniform culture, no uniform religion or physique, and even the features of some of the ceremonies of the Kirghiz, considered by Czaplicka to be one of the purest of Turkic tribes, are almost exactly similar to those of the Mongols. Ethnologically, therefore, they must be referred to the regions in which they live.

HISTORY

The discovery near the river Orkhon, to the south of Lake Baikal, of Turkish inscriptions dating from the 8th century A.D., and the publication of materials furnished by Chinese writers, has stimulated interest in the history of the Turkish movements in Asia.

Early Period.—From 1400 B.C. onwards, but especially about 200 B.C., Chinese history contains notices of warlike nomads called Hiung-nu or Hsiung-nu. Their political power broke up in the early centuries of this era before the advance of the Sien-pi and Tobas, who appear to have been Tunguses, and from whom arose the Wei dynasty of northern China. In A.D. 433 a Hiung-nu clan called Asena or A-shih-na, disliking the rule of the Wei, moved eastwards and sought the protection of a people called Jeu-Jen or Jwen-Jwen, who were also a kind of Hiung-nu They are the Geougen of Gibbon and others, and their identity with the Avars has been affirmed and disputed with equal confidence. The Asena served the Jwen-Jwen as workers in iron and lived not far from the modern city of Shan-Tan in Kan-suh. In this neighbourhood was a hill called from its shape Turkü, Durku or T'u-chueh, meaning helmet, and this is said to be the origin of the national name which has become so celebrated The name Tu-Kiue (Tou-Kiue) or Turk is first used by the Chinese in recording the events of A.D. 545, and the following years, when the Turks, or descendants of the Asena, revolted against the Jwen-Jwen. These latter were crushed and disappear from history, at least under that name. The victorious Turks advanced across their territory, came into collision with the Hephthalites or Ephthalites (*q.v.*), whom they defeated, and are heard of on the Oxus (*q.v.*), about A.D. 560. The period 546–582 marks the first brilliant epoch of early Turkish history. The tribes were not divided and made the most astounding advance Under Tumen (who took the title of Il-Khan), his brother Itsâmi or She-ti-mi (perhaps the Stembis of Greek writers), his son Mokan and Istâmi's son Tardu or Ta-t'eu. Though fifty years before only a servile clan in China, they sent an embassy in 567 to the East Roman emperor Justin II., as related by Menander Protector (C. Müller: *Fragm. hist. graec.*, vol. iv.). In 598 the khan Tardu wrote to the emperor Maurice, and in 620–28 the Turks assisted Heraclius in his campaigns against Persia. Meanwhile the Turks had themselves split into two divisions with separate princes. A tendency towards division, very natural in so loose and extended a community, had been visible for some time, and the rupture was precipitated in 582 by the jealousy of Ta-lo-pien or Dalobian, who was angry at not being chosen khan For a century and a half or so we hear of two khanates: the northern Turks, living near Lake Baikal and the southern tributaries of the Yenisei, and the western Turks, who appear to have had two headquarters, one near Urumchi and one near Aulieata, north of Tashkent. But their conquests, or at least their successful raids, extended very much farther to the west and south. In 630 the Chinese pilgrim Yüan Chwang (Hsüan Tsang) was well received by their khan, T'ung-she-ho, who exercised some kind of authority from Turfan to Merv. The Chinese followed a consistent policy of spreading dissension among these dangerous tribes and of supporting the factions that were weak or distant against those that were strong or near. Accordingly they were friendly to the western Turks until they had conquered the northern Turks. This western branch lasted until about 750 as a political name From about 550 till 650 they were independent, and, as mentioned. allies of the east Roman Empire against the Persians But about 650 the politics of the Nearer East were transformed by the conquests of the Arabs following on the preaching of Mahomet. After subduing Persia in 639 they spread to Transoxiana. At the same time dissension prevailed among the western Turks themselves: the five tribes called Nu-she-pi, who lived west of Issyk-kul, quarrelled with the five tribes called Tu-lu and in living to the east of it. The Chinese fomented the quarrel, and in 659 were able to declare that they annexed the whole territory of the western Turks, including at least Dzungaria, Tashkent, Ferghana, Bokhara, Khulm, Badakshan, Ghazni, Bamian, Udyana, Wakhan and Karateghin. But it would seem that neither the Turkish occupation nor the Chinese annexation of most of these countries was effective From 650 to 750 the possession of them was disputed not only by the Turks and Chinese but by the Tibetans in the east and the Arabs in the west In the west, the campaigns of Qotaiba b. Muslim or Kutaiba (705–14) completed the Mohammedan conquest of Transoxiana (*see* CALIPHATE, sect. B § 6).

For the history of the northern Turks our only authorities are the Orkhon inscriptions and Chinese writers The half-century following on the division was prosperous for the northern as well as for the western Turks, and they menaced China; but in 630 the Chinese conquered them. This is the Chinese servitude mentioned in the inscriptions. In 682 Kutluk (also called Elteres, which seems to be a title) re-established a Turkish state on the Orkhon He was succeeded by his brother Kapagan (or Me-Chuo), who subdued the Turgäsh, or perhaps merely drove them southwards, early in the 8th century, and was succeeded by Bilgä Kagan of the inscriptions.

This northern khanate was destroyed by a coalition of the Karluk, Uighur and Basmal in 744. These peoples, like the Turgäsh, appear to have been Turkish A succession of these pressed forward from the east. When first heard of, the Karluk inhabited the country on the Irtysh and the Urungu, and subsequently occupied Teles and Tokmak The Uighurs belonged to the group of tribes known as Tölös or T'ie-le and established themselves at Balasaghun (also known by the forms Kara-Balghasun, Kara-Balgassun and Balgasun· *see* KARAKORUM). This brings us to the middle of the 8th century For the next two hundred years the Turkish element in Central Asia, though it must have been numerous, does not cut any figure in history, which is filled with the chronicles of Arab and Persian dynasties (*see* CALIPHATE; SAMANIDS), but in the 10th century we begin to hear of it again. Turkish adventurers founded the dynasty of Ghaznevids at Ghazni, and there was a Uighur kingdom in the east comprising Kashgar and Khotan. Boghra Khan, the ruler of this kingdom, was converted to Islam at the end of the 10th century, and it continued under various branches of Uighurs until 1120. More important politically is the rise of the Seljuks. They were the princely family of the Kabaks, who were a section of the group of tribes called Ghuzz (Oghuz, Oğŭz), and are heard of in Transoxiana about 985 Their chieftains Toghrul and Chakir drove the Ghaznevids to India and established themselves as protectors of the Abbasid caliph, who formally ceded his temporal power to them. (For the history of the dynasty *see* SELJUKS.) Alp Arslan, the son of Chakir, defeated the Byzantines at Manzikert (1071), and prepared the way for the Ottoman conquests. His son Malik Shah ruled over nearly all the modern Turkey in Asia, and as far as the frontiers of China. On his death in 1092 his empire broke up into several pieces. Konia became the capital of the sultanate of Asia Minor and various Seljuk dynasties established themselves in Kerman, Irak and Syria. A new Turkish power was founded by the khans of Khiva, who are known as the Khwarizm-shahs. They were originally vassals of the Seljuks, with the title of tasdar or ewer-bearer, but became independent and conquered Khorasan and Irak. They had, however, to contend with yet another new arrival from the east, the Kara-Kitais. These also were probably Turks, and were pushed westwards from China by the Kins. They conquered Kashgar, Khotan, Yarkand and later Transoxiana, pushing the Ghuzz tribes before them into Persia and Afghanistan. Their prince bore the title of *gur-khan*, and the Khwarizm shahs did homage to him till

1208, when they unsuccessfully revolted. But all these squabbling principalities were swept away in 1219 by the extraordinary wave of invasion which surged across Asia to Europe under Jenghiz Khan (*q.v.*). After the death of Jenghiz his conquests were divided, and Transoxiana, Kashgar, Badakshan, Balkh and Ghazni were given to his second son Chagatai or Jagatai. Jenghiz and his family must have been Mongols, but the name Jagatai passed to the population and language of the countries about the Oxus. In 1321 the Jagatai khanate split into two khanates, Transoxiana and Dzungaria, and in 1370 collapsed before Timur. This great conqueror (1336–1405), who like Jenghiz had an extraordinary power of collecting and leading the hordes of Central Asia, was a native of the district of Samarkand and a Turk by descent. He conquered successively Dzungaria (1370), Persia and the Caucasus (1390), the Kipchaks on the Volga (1395), and Northern India (1398). He then invaded Syria and Asia Minor, where he defeated but did not annihilate the Osmanlis. The house of Timur did not retain his more distant conquests, but they ruled at Samarkand until 1499 with the usual struggles between different branches of the family. Their possessions included, at least from time to time, the northern parts of Afghanistan and Persia, as well as Transoxiana and Turkestan. They were one of the most enlightened and cultivated of Turkish dynasties. They beautified the cities of Central Asia and were patrons of literature. The literary languages were as a rule Arabic or Persian; Turkish was used more rarely and chiefly for poetry.

The Timurids were overthrown and succeeded by the Shaibani dynasty, a branch of the house of Juji, Jenghiz Khan's eldest son, to whom his father had assigned dominions in the region north of the kingdom of Jagatai. About 1465 a number of this clan migrated into the Jagatai khanate. They were given territory on the Chu River and were known as Uzbegs. About 1500 their chief, Mahommed Shaibani or Shahi Beg, made himself master of Transoxiana and founded the Uzbeg power. The chief opponent of the Uzbegs in their early days was Baber, who represented the house of Timur in the fifth generation, but he ultimately led his armies in another direction and invaded India (1526), where he founded the Mogul Empire, a far more important state than the principalities of the Oxus.

The Osmanlis, or house of Osman, the founders of the present Turkish Empire, appear to have been a clan similar to the early Seljuks or the present Turkomans of Transcaspia, who migrated into Asia Minor from Khorasan and made the neighbourhood of Brusa their headquarters. Their conspicuous position in history is mainly due to the fact that they attained pre-eminence very late and in districts very near Europe. Except for the invasion of Timur they did not suffer from the attacks of other Turks and they were able to concentrate their strength on the conquest of the decrepit Byzantine Empire. *See* TURKEY.

TURKS AND CAICOS ISLANDS, a group in the British West Indies, are geographically a part of the Bahamas but politically a dependency of Jamaica. The area is about 166 sq mi The population, mostly Negro, was 6,138 by the 1943 census and was estimated at 6,500 in 1950.

The Turks Islands, so named from a local cactus resembling a Turkish fez, are eight in number, but only two, Grand Turk (9 4 sq.mi., pop. 1,800) and Salt Cay (5½ sq.mi., pop. 400) are regularly inhabited. These two and Cockburn Harbour on South Caicos are ports of entry. The Caicos group, northwest of the Turks, includes six principal islands, South Caicos and North Caicos being the most important. The mean temperature is 82° F, but due to the prevailing trades the climate is not oppressive. Rainfall averages only 29¾ in. annually and drinking water is scarce, being rationed at times. Hurricanes are not infrequent. An unusually violent one in 1945 caused great damage.

Salt raking is the staple industry, with an average annual export of 43,000 tons, about half from South Caicos. Conchs and crayfish are also exported. Grand Turk, the seat of government, is an important cable junction, with cables to Jamaica, Bermuda and Barbados. There is frequent shipping and air service to Kingston, Jamaica. The islands were discovered by Juan Ponce de Leon in 1512 but were uninhabited until 1678, when Bermudians arrived and began the salt-raking industry. They were expelled by the Spanish in 1710 but soon returned, remaining despite Spanish and French attacks. In 1799 the islands were given representation in the Bahamas assembly but in 1848, on petition from the inhabitants, they were placed under Jamaica as a separate colony. In 1873 they were annexed by Jamaica. They are governed by a commissioner assisted by a legislative board. A small American air base was maintained on South Caicos from 1944 to 1947 and a guided missile base was established on Grand Turk in 1952.

(L. W. BR.)

TURKU (Swedish *Åbo*), a seaport of Finland on the Gulf of Bothnia. Pop. (1940) 75,419. It is the second largest town in Finland, and has a shipbuilding and repairing industry. An ice-breaker keeps the port open throughout the winter.

There are four entrances to the harbour, with lighthouses for each, and there are four patent slips capable of taking vessels up to 1,200 tons. The chief imports are salt, salt fish, pig iron, oils, coal, cotton, machinery and colonial goods, and the exports timber, grain, butter, bar iron, pork, beef and game. There is a considerable coasting trade.

After the Diet of Borgå in 1809, Turku became capital of the Russian Grand Duchy of Finland, but in 1819 the government was moved to Helsinki. It was founded in 1229 and has been a centre of Swedish culture, having a Swedish as well as a Finnish college.

TURKU-PORI (ÅBO-BJÖRNEBORG), a department in the southwest of the republic of Finland. Area (in English square miles), 8,500. Pop. (1940) 513,346. It is a lowland region containing much boulder-clay soil and a consequent imperfect drainage. The department, together with most of Finland, has not yet recovered from the effects of severe glaciation. Finnish and Swedish are spoken. The chief towns are Turku (Åbo), pop. (1940) 75,419; and Pori (Björneborg), 22,661.

TURMERIC, the tuberous rhizomes of *Curcuma longa,* an herbaceous perennial plant belonging to the family Zingiberaceae. It is a native of southern Asia, being cultivated on a large scale both on the mainland and in the islands of the Indian Ocean. Turmeric has been used from a remote period both as a condiment and as a dyestuff, and was once employed to a more limited extent as a medicine. In Europe it is employed chiefly as a dye, also as an ingredient in curry powder and as a chemical test for alkalies. The root (rhizome) is prepared by cleaning it and drying it in an oven. There are several varieties (Madras, Bengal, Gopalpur, Java, China and Cochin turmeric), differing chiefly in size and colour of the tubers and to a slight degree in flavour. All are hard and tough, but break with a short resinous or waxy fracture; the exposed surface varies in tint from an orange brown to a deep reddish brown. The colour is due to *curcumin,* $C_{21}H_{20}O_6$, of which the drug contains about 0·3%. When pure it forms yellow crystals having a vanilla odour and exhibiting a fine blue colour in reflected light. On oxidation with potassium permanganate it gives vanillin, the flavouring and odorous material of vanilla (*q.v.*). It is soluble in alcohol, in chloroform, but only sparingly in water. Paper tinged with a tincture of turmeric exhibits on the addition of an alkali a reddish brown tint, which becomes violet on drying, a test for alkalinity discovered by H. A. Vogel in 1815.

TURNEBUS, ADRIANUS [ADRIEN TURNEBE] (1512–1565), French classical scholar, was born at Les Andelys in Normandy, and at the age of 12 was sent to Paris to study. After having held the post of professor of belles-lettres in the University of Toulouse, in 1547 he returned to Paris as professor (or royal reader) of Greek at the Collège Royal. In 1552 he was entrusted with the printing of the Greek books at the royal press, in which he was assisted by his friend, Guillaume Morel (*q.v.*). He died of consumption on June 12, 1565. His works chiefly consist of philological dissertations, commentaries (on Aeschylus, Sophocles, Theophrastus, Philo and portions of Cicero), and translations of Greek authors into Latin and French. His son, Etienne, published his complete works, in three volumes (Strasbourg, 1600), and his son Adrien his *Adversaria,* containing explanations and emendations of numerous passages in classical authors.

See *Oratio funebris* by Léger du Chesne (Leodegarius a Quercu) prefixed to the Strasbourg edition; L. Clément, *De Adriani Turnebi praelaudibus et poematis* (1899); J. E. Sandys, *History of Classical Scholarship* (1908) iii.

TURNER, CHARLES (1774–1857), English engraver, was born at Woodstock on Aug. 31, 1774. He entered the schools of the Royal Academy in 1795; and, engraving in stipple in the manner of Bartolozzi, he was employed by Alderman Boydell. His finest plates, however, are in mezzotint, a method in which he engraved J. M. W Turner's "Wreck" and 24 subjects of his *Liber studiorum*, Reynolds's "Marlborough Family," and many of Raeburn's best portraits, including those of Sir Walter Scott, Lord Newton, Dr Hamilton, Professors Dugald Stewart and John Robinson, and Dr. Adam. He also worked after Lawrence, Shee and Owen. He was an admirable engraver, large, broad and masterly in touch. He died on Aug. 1, 1857.

TURNER, FREDERICK JACKSON (1861–1932), American historian, was born at Portage, Wis., on Nov. 14, 1861, and educated at the University of Wisconsin (A.B., 1884, A.M., 1888) and Johns Hopkins (Ph.D., 1890). He was assistant professor, 1889–91 and professor, 1892–1910, of American history at the University of Wisconsin. From 1910 to 1924 he was professor of history at Harvard, and afterwards professor emeritus. In 1927 he went to San Gabriel, Calif., to assume direction of research in the *Americana* of the large Henry E. Huntington library. His publications are few but they have been of great importance in their influence upon the interpretation and the writing of American history. In his essay "The Significance of the Frontier in American History," first published in the *Report of the American Historical Association* for 1893, he set forth the thesis that the frontier was up to that date the most influential factor in American history and in the development of a distinctly national character. Various other essays collected in *The Frontier in American History* (1921) amplify various phases of his thought and illustrate it by type studies. His viewpoint was also illustrated in his excellent study *The Rise of the New West* (1906) in the American nation series. Turner's students are numerous among American history teachers and writers of mid-west universities and historical societies, and through their agency, perhaps more than through his writings, his ideas have been made vital in American historiography.

TURNER, JOSEPH MALLORD WILLIAM (1775–1851), English painter, was born in London on April 23, 1775. His father, William Turner, a native of Devonshire, kept a barber's shop at 26 Maiden Lane, Covent Garden. His mother died insane. The earliest known drawing by Turner, a view of Margate Church, dates from his ninth year. His father taught him to read, and this and a few months at a school at New Brentford and afterwards at Margate were all the schooling he ever had; he never mastered his native tongue. Yet, one of his strongest characteristics was a taste for associating his works with personages and places of legendary and historical interest.

Early Training.—By the time Turner was thirteen he had chosen an artist's career. In 1788–89 he was receiving lessons from Palice, "a floral drawing master;" from T. Malton, a perspective draughtsman, and from Hardwick, an architect. He also attended Paul Sandby's drawing school in St. Martin's Lane. Part of his time was employed in making drawings at home, which he exhibited for sale in his father's shop window, two or three shillings being the usual price. He coloured prints for engravers, washed in backgrounds for architects, went out sketching with Girtin, and made drawings in the evenings for Dr Munro "for half a crown and his supper." In 1789 Turner became a student of the Royal Academy. He also worked for a short time in the house of Sir Joshua Reynolds. In 1790 he exhibited for the first time at the Royal Academy, a "View of the Archbishop's Palace, Lambeth." About 1792 he received a commission from Walker, the engraver, to make drawings for his *Copper-Plate Magazine*, and this topographical work took him to many interesting places. A year or two after he accepted a similar commission for the *Pocket Magazine*, and before his twentieth year he had travelled over many parts of England and Wales. None of these magazine drawings is remarkable for originality or for artistic feeling.

Until 1792 Turner's practice had been almost exclusively in water colour, and his early works show how much he was indebted to some of his contemporaries, such as J. R. Cozens. His first exhibited oil picture appeared in the Academy in 1793. In 1794–95 Canterbury Cathedral, Malvern Abbey, Tintern Abbey, Lincoln and Peterborough Cathedrals, Shrewsbury, and King's College Chapel, Cambridge, were among the subjects exhibited, and during the next four years he contributed no less than thirty-nine works to the Academy. In the catalogue of 1798 he first began to add poetic quotations to the titles of his pictures, showing that his mind was now occupied with something more than the merely topographical element of landscape. Milton's *Paradise Lost* and Thomson's *Seasons* being laid under frequent contribution for descriptions of sunrise, sunset, twilight or thunderstorm. Turner's first visit to Yorkshire took place in 1797. It seems to have braced his powers and possibly helped to change the student into the painter. Until then he was little more than a painstaking and tolerably accurate topographer, but even under these conditions he had begun to attract the notice of his brother artists and of the critics. The only formidable rivals Turner had to contend with were De Loutherbourg and Girtin, and after the death of the latter in 1802 he was left undisputed master of the field.

(1799–1804).—In 1799 he was elected A.R.A. (age 24), and by 1800 had moved to Harley Street. He was elected R.A. in 1802. He enjoyed the dignity of Academician for nearly half a century, and he took an active share in the direction of the Academy's affairs. His speeches are described as "confused, tedious, obscure, and extremely difficult to follow"; but at council meetings he was ever anxious to allay anger. His opinions on art were always listened to with respect; but on matters of business it was often difficult to know what he meant. His friend Chantrey used to say, "He has great thoughts, if only he could express them." When appointed professor of perspective to the Royal Academy in 1808, this painful lack of expression stood greatly in the way of his usefulness. Ruskin says, "The zealous care with which Turner endeavoured to do his duty is proved by a series of large drawings, exquisitely tinted, of the most difficult perspective subjects, illustrating not only directions of line, but effects of light, with a care and completion which would put the work of any ordinary teacher to utter shame." With his election to the associateship of the Academy Turner's early struggles may be considered to have ended. He abandoned topographical fidelity and began to paint his dreams, the visionary faculty—the true foundation of his art—asserting itself, nature being used to supply suggestions and materials. His work is described by Ruskin as "stern in manner, reserved, quiet, grave in colour, forceful in hand."

Turner's visit to Yorkshire in 1797 was followed a year or two later by a second, when he made the acquaintance, which afterwards ripened into a long and staunch friendship, of Fawkes of Farnley Hall. From 1803 till 1820 Turner was a frequent visitor at Farnley. The large number of his drawings still preserved there—English, Swiss, German and Italian, the studies of rooms, outhouses, porches, gateways, of birds shot while he was there, and of old places in the neighbourhood—prove the frequency of his visits and his affection for the place. Turner visited Scotland in 1800, and in 1801 or 1802 he made his first tour on the Continent. In the following year, of the seven pictures he exhibited, six were of foreign subjects, among them "Bonneville," "The Festival upon the Opening of the Vintage of Mâcon," and the well-known "Calais Pier" in the National Gallery. The last-named picture, although heavily painted and somewhat opaque in colour, is magnificently composed and full of energy. In 1802 he took his father, who still carried on the barber business in Maiden Lane, to live with him. Turner was never the same man after his father's death in 1830, when he lived a solitary life.

The Liber Studiorum.—In 1804 Turner made a second tour on the Continent, and in the following year painted the "Shipwreck" and "Fishing Boats in a Squall" (in the Ellesmere collection), seemingly in direct rivalry of Vandervelde, in 1806 the "Goddess of Discord in the Garden of the Hesperides" (in rivalry of Poussin), and in 1807 the "Sun rising through Vapour" (in

rivalry of Claude) The last two are notable works, especially the "Sun." In after years it was one of the works he left to the nation, on the special condition of its being hung beside the Claudes in the National Gallery. In this same year (1807) Turner commenced his most serious rivalry Possibly it arose out of a desire to break down Claude worship—the then prevailing fashion—and to show the public that there was a living artist not unworthy of taking rank beside him. That the *Liber studiorum* was suggested by the *Liber veritatis* of Claude, and was intended as a direct challenge to that master, is beyond doubt. There is, however, a certain degree of unfairness to Claude in the way in which the challenge was given Claude made drawings in brown of his pictures as they left the easel, not for publication, but merely to serve as private memoranda Turner's *Liber* drawings had no such purpose, but were intended as a direct appeal to the public to judge between the two artists. The first of the *Liber* drawings was made in the autumn of 1806, the others at intervals till about 1815 They are of the same size as the plates and carefully finished in sepia He left over fifty of these to the National Gallery. The issue of the *Liber* began in 1807 and continued at irregular intervals till 1819, when it stopped at the fourteenth number Turner had resolved to manage the publishing business himself, but in this he was not very successful He soon quarrelled with his engraver, F. C Lewis, on the ground that he had raised his charges from five guineas a plate to eight. He then employed Charles Turner, who agreed to do fifty plates at the latter sum, but, after finishing twenty, he too wished to raise his price, and, as a matter of course, this led to another quarrel. Reynolds, Dunkarton, Lupton, Say, Dawe and other engravers were afterwards employed—Turner himself etching and mezzotinting some of the plates

Each part of the *Liber* contained five plates, the subjects, divided into "historical," "pastoral," "marine," etc, embracing the whole range of landscape art Seventy-one plates in all out of one hundred were published (including one as a gift of the artist to his subscribers); ten other plates—more or less completed—intended for the fifteenth and sixteenth numbers were never published, the work being stopped for want of encouragement. The merit of the plates is unequal; some—for example, "Solway Moss," "Inverary Pier," "Hind Head Hill," "Ben Arthur," "Rizpah," "Junction of the Severn and Wye" and "Peat Bog"—are of great beauty, while a few are comparatively tame and uninteresting. Among the unpublished plates "Stonehenge at Daybreak," "The Stork and Aqueduct," "The Via Mala," "Crowhurst," and "Moonlight off the Needles" take a high place. The *Liber* shows strong traces of the influence of Cozens and Girtin, and, as a matter of course, of Claude A good deal has been written about Turner's intention, and the "lessons" of the *Liber studiorum*. Probably his only intention in the beginning was to show what he could do, to display his art, to rival Claude, perhaps to educate public taste, and at the same time make money Already in this work are seen strong indications of one of his most remarkable characteristics—a knowledge of the principles of structure in natural objects; mountains and rocks are drawn, not with topographical accuracy, but with what appears like an intuitive feeling for geological formation; and trees have also the same expression of life and growth in the drawing of stems and branches This instinctive feeling in Turner for the principles of organic structure is described in the fourth volume of *Modern Painters*.

A curious example of the *reasonableness* accompanying his exercise of the imaginative faculty is to be found in his creations of creatures he had never seen, as, for example, the dragon in the "Garden of the Hesperides" and the python in the "Apollo," exhibited in 1811. Both these monsters are imagined with such vividness and reality, and the sense of power and movement is so completely expressed, that the spectator never once thinks of them as otherwise than representations of actual facts in natural history. He was further aided by a memory of the most retentive kind. A good illustration of this may be seen at Farnley Hall in a drawing of a "Man-of-War taking in Stores." Some one, who had never seen a first-rate, expressed a wish to know what it looked like. Turner took a blank sheet of paper, outlined the ship, and finished the drawing in three hours.

From 1813 till 1826, in addition to his Harley Street residence, Turner had a country house at Twickenham He kept a boat on the river, also a pony and gig, in which he used to drive about the neighbouring country on sketching expeditions. The pony, for which Turner had a great love, appears in his well-known "Frosty Morning" in the National Gallery In 1813 Turner commenced the series of drawings, forty in number, for Cooke's *Southern Coast* This work was not completed till 1826. The price he at first received for these drawings was £7, 10s each, afterwards raised to £13, 2s. 6d.

"Crossing the Brook" appeared in the Academy of 1815. It marks the transition from his earlier style to that of his maturity It represents a piece of Devonshire scenery, a view on the river Tamar. In design and execution this work is founded upon Claude. The colour scheme is limited to greys and quiet greens for the earth and pale blues for the sky. It is a sober but very admirable picture, full of diffused daylight "Dido Building Carthage" also belongs to this period It hangs beside the Claudes in the National Gallery Towering masses of Claudesque architecture piled up on either side, porticoes, vestibules, and stone pines, with the sun in a yellow sky, show the Carthage imagined.

Middle Period.—In 1818 Turner was in Scotland making drawings for the *Provincial Antiquities*, for which Sir Walter Scott supplied the letterpress, and in 1819 he visited Italy for the first time. From this time his works became remarkable for their colour Hitherto he had painted in browns, greys and blues, using red and yellow sparingly He had gradually been advancing from the sober grey colouring of Vandervelde and Ruysdael to the mellow and richer tones of Claude. His works now began to show a heightened scale of colour, gradually increasing in richness and splendour and reaching its culminating point in such works as "Ulysses," "Childe Harold's Pilgrimage," "The Golden Bough," and "The Fighting Téméraire." All these works belong to the middle period of Turner's art (1829–1839), when his powers were entirely developed. Much of his most beautiful work at this period is to be found in his water-colour drawings: those executed for Whitaker's *History of Richmondshire* (1819–1821), for Cooke's *Southern Coast* (1814–26), for *The Rivers of England* (1824), for *England and Wales* (1829–38), *Provincial Antiquities* (1826), Roger's *Italy* (1830), Scott's *Works* (1834), and *The Rivers of France* (1833–35) are in many instances of the greatest beauty.

One of the great services Turner rendered to the art of England was the education of a whole school of engravers. His best qualities as a teacher came from the union of strength and delicacy in his work; subtle and delicate tonality was almost a new element for the engraver to deal with, but with Turner's teaching and careful supervision his engravers by degrees mastered it more or less successfully, and something like a new development of the art of engraving was the result. No better proof can be found of the advance made than by comparing the work of the landscape engravers of the pre-Turnerian period with the work of Miller, Goodall, Willmore, Cooke, Wallis, Lupton, C. Turner, Brandard, Cousen, and others who worked under his guidance The art of steel engraving reached its highest development in England at this time Roger's *Italy* (1830) and his *Poems* (1834) contain perhaps the most beautiful and delicate of the many engravings executed after Turner's drawings. They are vignettes, a form of art which Turner understood well "The Alps at Daybreak," "Columbus Discovering Land," and "Datur Hora Quieti" are superb

In 1828 Turner paid a second visit to Italy, this time of considerable duration, on the way visiting Nîmes, Avignon, Marseilles, Genoa, Spezzia and Siena, and in the following year he exhibited the "Ulysses Deriding Polyphemus," now in the National Gallery. It marks the beginning of the central and best period of Turner's power. The picture is of great power and splendour The painting throughout is magnificent, especially in the sky. From this period till 1840 Turner was entirely absorbed in his art, and so isolated. Between 1829 and 1839 he sent fifty-five pictures to the Royal Academy, painted many others on private commission, made over four hundred drawings for engravers, besides thousands of studies and sketches from nature.

Later Work.—The first of Turner's Venetian pictures ("Bridge of Sighs, Ducal Palace and Custom House, Venice, Canaletto Painting") appeared in the Academy in 1833 Compared with the sober work of Canaletto, Turner's pictures of Venice appear like poetic dreams. Splendour of colour generally characterize them Venice appeared to him "a city of rose and white, rising out of an emerald sea against a sky of sapphire blue." Many of these Venetian pictures belong to his later manner, and some of them, "The State Procession bearing Giovanni Bellini's Pictures to the Church of the Redeemer" (exhibited in the Royal Academy, 1841), "The Sun of Venice Going to Sea" (1843), "Approach to Venice" (1844), and "Venice, Evening, Going to the Ball" (1845), to his latest. As Turner grew older his love of brilliant colour and light became more and more a characteristic

"The Fighting Téméraire Tugged to her Last Berth to be Broken Up" was exhibited in the Academy of 1839 Turner had all his life been half a sailor at heart many of his best pictures are sea pieces Hence the pathetic feeling he throws around the old three-decker, looking ghostly and wan in the evening light. "The Slave Ship," another important sea picture, was exhibited in the following year, and in 1842 "Peace. Burial at Sea," commemorative of Wilkie. His faculty for colour remained unimpaired almost to the end. He paid his last visit to the Continent in 1843, avoiding his own countrymen, an old and solitary man.

In 1850 he exhibited for the last time. He had given up attending the meetings of the Academicians, none of his friends had seen him for months; and even his old housekeeper had no idea of his whereabouts. Turner's mind had evidently given way, and with that love of secrecy which in later years had grown into a passion he had gone to hide himself in a corner of London He had settled as a lodger in a small house in Chelsea, overlooking the river, kept by his old Margate landlady, Mrs. Booth. To the children in the neighbourhood he was known as "Admiral Booth." His short, sailor-like figure may account for the idea that he was an impoverished old naval officer. He had been ill for some weeks, and when his Queen Anne Street housekeeper at last discovered his hiding-place she found him sinking, and on the following day, Dec. 19, 1851, he died. He was buried in St Paul's Cathedral, in deference to his wish He left a large fortune (about £140,000) to found a charity for the "maintenance and support of male decayed artists, being born in England, and of English parents only; and of lawful issue" His pictures he bequeathed to the nation, on condition that they were exhibited in rooms of their own, and that these rooms were to be called "Turner's Gallery." The will and its codicils were so confused that after years of litigation, during which a large part of the money was wasted in legal expenses, it was found impossible to decide what Turner really wanted. A compromise was effected, his next-of-kin inheriting the bulk of his property. The Royal Academy got £20,000 and the nation got all the pictures and drawings (now housed in the National Gallery and in the Tate gallery in rooms erected by the generosity of Sir Joseph Duveen. Of the 282 pictures and studies, 199 are now framed and exhibited. Of the collection of drawings numbering over 19,000 only a part are on exhibition).

In 1843 a champion, in the person of John Ruskin, arose to defend Turner against the unjust and ignorant attacks of the press, and what at first was intended as a "short pamphlet, reprobating the manner and style of these critics," grew into the five volumes of *Modern Painters*. Ruskin employed all his eloquence and his great critical faculty to prove how immeasurably superior Turner was to all who had ever gone before, hardly restricting his supremacy to landscape art, and placing him among the "seven supreme colourists of the world."

BIBLIOGRAPHY.—Ruskin, *Modern Painters* (1843–60), *Harbours of England* and *Notes on the Turner Gallery at Marlborough House* (1856); Wornum, *The Turner Gallery* (1859); Burnet, Cunningham and Murray, *Turner and his Works* (1859), *Notes on his drawings by Turner* (1878); Thornbury, *Life* (1862 and 1877); P. G. Hamerton, *Life* (1879); C. Monkhouse, *Turner* (1879); F. Wedmore, *Turner and Ruskin* (1900); Sir W. Armstrong, *Turner* (1902) with list of works by E. Dillon; W. L. Wyllie, *Turner* (1905), W. G. Rawlinson, *Turner's Liber Studiorum*, 2nd ed. (1906); *The Engraved Work of Turner* (1908); C Mallord Turner, *The Family History of the late J. M. Turner* (1902); *Catalogue of the Turner Collection* (Tate Gallery, 1920), *A complete inventory of the drawings of the Turner Bequest*, with which are included the 23 drawings bequeathed by M. H. Vaughan, arranged chronologically by A. J. Finberg (1909); D. S. MacColl, *Turner's Lectures at the Academy*, Burlington Magazine (1908).

(G. RE.; X.)

TURNER, NAT (1800–1831), the Negro leader of a slave insurrection in Virginia, known as the "Southampton insurrection," was born in Southampton county, Va., in 1800. From his childhood he claimed to see visions and hear voices, and he became a Baptist preacher of great influence among the Negroes. In 1828 he confided to a few companions that a voice from heaven had announced that "the last shall be first," which was interpreted to mean that the slaves should control. An insurrection was planned, and a solar eclipse in Feb. 1831, and peculiar atmospheric conditions on Aug. 13, were accepted as the signal for beginning the work.

On the night of Aug. 21, 1831, with seven companions, he entered the home of his master, Joseph Travis, and murdered the inmates. After securing guns, horses and liquor they visited other houses, sparing no one. Recruits were obtained in some cases by compulsion, until the band numbered about 60. About noon on the 22nd they were scattered by a small force of whites, hastily gathered Troops, marines and militia were hurried to the scene, and the Negroes were hunted down. In all 13 men, 18 women and 24 children had been butchered

After hiding for several weeks Turner was captured on Oct. 30 and was tried and hanged, having made, meanwhile, a full confession. Nineteen of his associates were hanged and 12 were sent out of the state. The insurrection, which was attributed to the teachings of the abolitionists, led to the enactment of stricter slave codes.

See S. B. Weeks, "Slave Insurrections in Virginia," in *Magazine of American History*, vol. xxxi, (1891) and W. S. Drewry, *The Southampton Insurrection* (1900).

TURNER, SHARON (1768–1847), English historical writer, was born in London, Sept. 24, 1768. He was educated as an attorney there and practised with success from 1789–1829, when he retired because of his health He is most noted, however, for his historical writing, in which he was engaged from the time he was a young man until his death. His *History of England from the Earliest Period to the Death of Elizabeth* was a monumental work, which appeared in parts, as each section was completed It began with a *History of the Anglo-Saxons; comprising the History of England from the Earliest Period to the Norman Conquest* (4 vol., 1799–1805), much of the information for which he took from original Anglo-Saxon manuscripts, a source previously untapped by British authors This work was followed by the *History of England from the Norman Conquest to 1509* (3 vol., 1814–23); *History of the Reign of Henry VIII; comprising the Political History of the Commencement of the English Reformation* (4 vol , 1826) and *History of the Reigns of Edward VI, Mary and Elizabeth* (4 vol , 1829) The entire work was published in 12 volumes in 1839.

Turner was also the author of a *Sacred History of the World, as Displayed in the Creation and Subsequent Events to the Deluge, Attempted to be Philosophically Considered in a Series of Letters to a Son* (3 vol., 1832), a book of patriotic poems, *Prolusions on the Recent Greatness of Britain, on Modern Poetry and on the Present Greatness of the World* (1819); and several pamphlets.

Of his history of England, the section on the Anglo-Saxons is generally considered to be by far the best, both from the point of view of historical accuracy and of excellence of style. Turner died in London, Feb. 13, 1847.

TURNHOUT, town in the province of Antwerp, Belgium, 26 mi. N.E. of that city. Pop. (est. 1939) 30,088. It carries on an active industry in cloth, playing cards and other manufactures. There is a breeding establishment for leeches The town hall was formerly a palace of the dukes of Brabant. Two miles west of Turnhout is the curious penal or reformatory colony of

Merxplas. The system of this establishment is to allow certain approved prisoners to follow their usual occupations within a defined area.

TURNIP (*Brassica rapa*), a hardy biennial, of the family Cruciferae, which has been cultivated from a remote period for its fleshy roots. The tender growing tops are also used widely as a green vegetable. The so-called "root" is formed by the thickening of the primary root of the seedling together with the base of the young stem (hypocotyl) immediately above it. The great mass of the "root" consists of soft "wood" developed internally by the cambium layer and composed mainly of thin-walled, unlignified, wood-parenchyma.

The stem remains short during the first year, the leaves forming a rosette-like bunch at the top of the root; they are grass-green and bear rough hairs In the second season the bud in the centre of the rosette forms a strong erect branched stem bearing somewhat glaucous smooth leaves. The stem and branches end in corymbose racemes of small, bright yellow flowers, which are succeeded by smooth, elongated, short-beaked pods.

The turnip probably originated in Europe or western Asia and by cultivation has spread throughout the temperate zone

The varieties of turnip are classified according to their shape as (1) long varieties, with a root three or more times as long as broad; (2) tankard or spindle-shaped varieties, with a root about twice as long as broad; (3) round or globe varieties with an almost spherical root; (4) flat varieties with a root broader than long; there are also many intermediate forms. Turnips are also grouped according to the colour of the upper part of the root, which comes above ground, and according to the colour of the flesh, which is white or yellow.

The *yellow-fleshed varieties*, which are not hybrids between the turnip and swede, are more robust, of slower growth and superior feeding value to the white-fleshed turnips and are less injured by frost. The foliage turnip produces no enlarged root but only a profusion of leaves which are used as a pot-herb A variety of this form called Seven-Top is widely grown in the southern United States.

The swede-turnip (*Brassica napobrassica*) or rutabaga differs from the turnip proper in having the first foliage-leaves glaucous, not grass-green, in colour and the later leaves smooth and glaucous; the root bears a distinct neck with well-marked leaf-scars, the flesh is white or yellow, firmer and more nutritious; and the roots keep much better during winter.

The white-fleshed forms have a rough, green skin, firm white flesh and are of irregular form. The flowers are of a bright canary colour.

The yellow-fleshed swede-turnips have a firm yellow flesh, a smooth skin of a green, purple or bronze colour. The flowers are buff yellow or pale orange. (X.)

CULTIVATION AND TRADE

Both the turnip and rutabaga are cool-season crops, intolerant of the hot weather of the lower latitudes The rutabaga grows less rapidly, requiring a longer season. In the lower latitudes turnips are sown either in early spring or in late summer, developing rapidly enough to make a crop before extremes of summer or late fall weather occur. Rutabagas, however, are sown only as a main or late crop and are the more hardy to cold. Rutabagas are little grown in the United States except in the northernmost states, but are grown extensively in Canada, Great Britain and northern Europe. Turnips are grown in the cooler regions during the summer.

Both species are extensively grown as livestock feed in northern climates but in the United States are grown almost entirely as a vegetable.

Extensive culture of turnips as a forage crop for sheep and cattle began in Great Britain about 1724 and increased rapidly because it fitted so well into the system of crop rotation and stock feeding that was developing in the 18th century. Turnips afforded large quantities of winter feed, thus increasing the conversion of straw into barnyard manure for the improvement of the lighter soils. They are generally grown in rotation with grain crops and are well adapted to clean row culture designed to free the land of weeds that interfere with grain production. Animal manures are generally applied, although chemical fertilizers alone may be used. About 850 lb per acre of a mixture analyzing approximately 5% nitrogen, 10% phosphoric acid and 7% potash is commonly applied

White turnips are often sown broadcast, in both Europe and America, and neither cultivated nor thinned Swedes and yellow turnips are usually sown in rows about 2 ft apart. When large stock-feeding varieties are grown, they are thinned to about 10 in apart in the row, but when swedes or turnips are grown for human food they are thinned to only 3-6 in. apart in the rows

Although considerable quantities of these species are grown in home and market gardens, and are even shipped long distances in the United States, the total volume of trade in them remains comparatively small. (V R B.)

TURNSTONE (*Arenaria interpres*), a shore-bird found on the coasts of every part of the world, but breeding only in the high Arctic. About the size of a snipe, and allied to the plovers (*q v*), the turnstone has short legs and a heavy build. The white face, striped with black, the black gorget and white band on the wings are characteristic features. The sexes are alike. The bird feeds on small crustacea, worms, etc, which it seeks under stones. The nest contains four olive-green eggs, closely blotched with brown. Both male and female incubate

TURNTABLE. A rotary platform which turns wagons, carriages and locomotives. The smallest sizes are less than three feet in diameter and are without rails, being used for light temporary work or with portable tracks. In other cases rails are mounted, flush with the surface, for use inside factories or other places subject to foot or wheeled traffic. A circle of small rollers or a ring of balls supports these tables. An automatic catch prevents the table from making more than a quarter of a revolution at a time, unless it is desired to move further.

In the large tables for carriages and wagons the load is carried upon a centre pivot, and the two rollers at each end run on a circular rail or *race*, and function when the load is unbalanced The rollers are attached to steel joists bolted to the main girders and the rollers can be taken off for cleaning at any time. A hand lever enables the table to be readily pulled around, then locked with a wedge which also blocks up the end, so taking the load off the wheels. When there is insufficient depth available for the pit of an ordinary turntable, the "inverted girder" or "surface type" is installed, the girders being placed upside down in this type of construction. If locomotives cannot be well balanced, or rapid handling is important, power-driven turntables are chosen. In the electric tractor system, a wheel resting on the circular race is driven by a motor so as to turn the table in about a minute Rotating gear on the winch system comprises a barrel pulling on two steel wire ropes so that one pays out while the other winds in. These operate a wheel on the race. Some turntables, for locomotive manufacturing works, carry three tracks (*e.g*, 2 ft. 6 in., 4 ft. 8½ in., and 5 ft. 6 in). The centre-pivot support is not applied in this case, but the uneven loads are sustained by a ring of cast-steel rollers running on the 50-foot diameter race Some tables are about 85 ft. in diameter and take engines up to 267 tons, 5 ft. 6 in gauge. The electric tractor drive is fitted to these. Turntables are also used in motor garages and works.

TURNU SEVERIN, the capital of the department of Mehedinti, Rumania, on the main Walachian railway, and on the left bank of the river Danube, below the Iron Gates cataracts. Pop. (1936) 21,073. It is a modern commercial town, having a school of arts and crafts, several churches, and large government yards for the building of river steamers, lighters and tug-boats. There is a considerable trade in livestock, preserved meat, petroleum and cereals. The town, which was originally called Drobetae by the Romans, took its later name of Turris Severi, or the "Tower of Severus," from a tower built to commemorate a victory over the Quadi and Marcomanni, by the Roman emperor Severus (A.D. 222–235). Near Turnu Severin are the remains of the celebrated Trajan's bridge, the largest in the Roman empire, built in

A.D. 103 by Apollodorus of Damascus. The river is about 4,000 ft broad at this spot The bridge of twenty arches was supported by stone pillars, several of which are still visible at low water

TURNVEREIN, a German institution founded in the early part of the 19th century by Friedrich Ludwig Jahn for the purpose of furthering physical education. German settlers established branches in the United States and later their objectives were extended to include the discussion of intellectual, political, social and religious ideas. In 1925, there were in the United States 160 local societies, with a total membership of more than 30,000, not including 6,000 members of women's auxiliaries. Since 1866 they have maintained a normal college at Indianapolis, Ind., for the training of teachers of physical education.

TURPENTINE, the oleo-resins which exude from some conifers—such as *Pinus sylvestris*—and from the terebinth tree, *Pistacia terebinthus, L.* It was to the product of the latter, now known as Chian turpentine, that the term was first applied. The tree is a native of the islands and shores of the Mediterranean, passing eastward into central Asia; but the resinous exudation found in commerce is collected in the island of Chios. Chian turpentine is a tenacious semi-fluid transparent body, yellow to dull brown in colour, with an agreeable resinous odour and little taste. On exposure to air it becomes dry, hard and brittle. Turpentines are semi-fluid bodies, consisting of resins dissolved in turpentine oil, the chief constituent of which is pinene They are largely used in the arts, being separated by distillation into rosin or colophony (*see* ROSIN), and oil or spirit of turpentine.

Crude or *common turpentine* is the commercial name for the oleo-resin yielded by several coniferous trees, both European and American. The principal European product (Bordeaux turpentine) is obtained from the cluster pine, *Pinus Pinaster,* in the Landes department of France. Crude turpentine is further yielded by the Scotch fir, *P. sylvestris,* and by the Corsican pine, *P. Laricio.* In the United States the turpentine-yielding pines are the long leaf pine, *P. palustris,* and slash pine, *P. caribaea,* both inhabiting North and South Carolina, Georgia, Florida, and Alabama. *Venice turpentine* is yielded by the larch, *Larix europaea; Strassburg turpentine* is obtained from the bark of the silver fir. Less known turpentines are obtained from the mountain pine, *P. Pumilio,* the stone pine, *P. Cembra,* the Aleppo pine, *P. halepensis,* etc. The so-called *Canada balsam,* from *Abies balsamea,* is also a true turpentine.

"Turps."—*Oil of Turpentine,* or *Turps,* as a commercial product is obtained from all or any of these oleo-resins, but on a large scale only from crude turpentine. The essential oil is rectified by redistillation with water and alkaline carbonates, and the water which the oil carries over with it is removed by a further distillation over calcium chloride. Oil of turpentine is a colourless, oily liquid, with a strong odour and a hot disagreeable taste. It begins to boil at about 155° C, and its specific gravity is between 0·860 and 0·880. It rotates the plane of polarized light either to right or left in varying degrees according to the species of tree, the American product from *P. palustris* being dextrorotatory and *P. caribaea* laevorotatory and the French laevorotatory. It is almost insoluble in water, is miscible with absolute alcohol and ether, and dissolves sulphur, phosphorus, resins and caoutchouc. On exposure to the air it dries to a solid resin, and absorbing oxygen gives off ozone. Agitated with successive quantities of sulphuric acid and distilled in a current of steam, it yields terebene, a mixture of dipentene and terpinene mainly, which is used in medicine. Chemically, oil of turpentine is a mixture of terpenes (*q.v.*). It is largely used in the preparation of varnishes and as a medium by painters in their "flat" colours.

Pharmacology and Therapeutics.—Oil of turpentine (*Oleum terebinthinae*) is used internally as an anthelmintic to kill tapeworm. Externally it acts as a rubefacient, an irritant and a counter-irritant. It is an antiseptic and, in small quantities, a feeble anaesthetic. It is absorbed by the unbroken skin. It is largely employed as a counter-irritant, the pharmacopoeial liniments being useful in myalgia, bronchitis, "chronic rheumatism" and pleurisy. In large doses oil of turpentine causes purging and may induce haemorrhage from the bowel or kidneys. It is absorbed unchanged and has a marked contractile action upon the blood vessels. It is a nervous depressant leading even to coma and total abolition of reflex action. The drug is excreted partly by the bronchi and partly in the urine. Glycuronic acid also appears in the urine. It may give rise to an erythematous rash. It must not be given to the subjects of Bright's disease. Its chief uses are as constituents of fomentations and enemata and as a local disinfectant in bronchiectasis (*q.v.*). Old turpentine and French oil of turpentine are antidotes to phosphorus, forming turpentine-phosphoric acid, which is inert.

(A. D. J.)

TURPIN (d. *c.* 800), archbishop of Reims, was for many years regarded as the author of the legendary *Historia de vita Caroli Magni et Rolandi,* and appears as one of the twelve peers in a number of the *chansons de geste.* He is probably identical with Tilpin, archbishop of Reims in the 8th century, who is alluded to by Hincmar, his third successor in the see. According to Flodoard, Charles Martel drove Rugobert, archbishop of Reims, from his office and replaced him by a warrior clerk named Milo, afterwards bishop of Trier. The same writer represents Milo as discharging a mission among the Vascones, or Basques, the very people to whom authentic history has ascribed the great disaster which befell the army of Charlemagne at Roncesvalles.

Flodoard says that Tilpin was originally a monk at St. Denis, and Hincmar tells how after his appointment to Reims he occupied himself in securing the restoration of the rights and properties of his church, the revenues and prestige of which had been impaired under Milo's rule. Tilpin was elected archbishop between 752 and 768, probably in 753; he died, if the evidence of a diploma alluded to by Mabillon may be trusted, in 794, although it has been stated that this event took place on Sept. 2, 800 Hincmar, who composed his epitaph, makes him bishop for over forty years, and from this it is evident that he was elected about 753, and Flodoard says that he died in the forty-seventh year of his archbishopric Tilpin was present at the Council of Rome in 769, and at the request of Charlemagne Pope Adrian I. sent him the pallium and confirmed the rights of his church.

The *Historia Caroli Magni* was declared authentic in 1122 by Pope Calixtus II. It is, however, entirely legendary, being rather the crystallization of earlier Roland legends than the source of later ones, and its popularity seems to date from the latter part of the 12th century. Gaston Paris, who made a special study of the *Historia,* considers that the first five chapters were written by a monk of Compostella in the 11th century and the remainder by a monk of Vienne between 1109 and 1119. There are at least five French translations of the *Historia* dating from the 13th century and one into Latin verse of about the same time. According to Potthast there are about fifty manuscripts of the story in existence. The *Historia* was first printed in 1566 at Frankfort; perhaps the best edition is the one edited by F. Castets as *Turpini historia Karoli magni et Rotholandi* (Paris, 1880) It has been translated many times into French and also into German, Danish and English. The English translation is by T. Rodd and is in the *History of Charles the Great and Orlando, ascribed to Turpin* (London, 1812). *See* G. Paris, *De pseudo-Turpino* (Paris, 1865), and *Histoire poétique de Charlemagne,* new ed. by P. Meyer (1905); and V. Friedel, "Etudes compostellanes" in *Oita Mercelana* (Liverpool, 1899).

TURPIN, RICHARD [DICK] (1706–1739), English robber, was born in 1706 at Hempstead, near Saffron Walden, Essex, where his father kept an alehouse. He was apprenticed to a butcher, but, having been detected at cattle-stealing, joined a notorious gang of deer-stealers and smugglers in Essex. On the gang being broken up Turpin went into partnership with Tom King, a well-known highwayman. To avoid arrest he finally left Essex for Lincolnshire and Yorkshire, where he set up under an assumed name as a horse dealer. He was convicted at York assizes of horse-stealing and hanged on April 7, 1739. Harrison Ainsworth, in his romance *Rookwood,* gives a spirited account of a wonderful ride by Dick Turpin on his mare, Black Bess, from London to York But as far as Turpin is concerned the incident is pure fiction. A somewhat similar story was told about a certain John Nevison, known as "Nicks," a well-known highwayman in the time of Charles II, who to establish an alibi rode from Gad's Hill to York (some 190 m.) in about 15 hours.

TURQUOISE, a mineral much used as an ornamental stone for the sake of its blue or bluish-green colour. It is generally held that the name indicates its source as a stone from Turkey,

the finest kinds having come from Persia by way of Turkey

Turquoise is a crypto-crystalline mineral, occurring in small reniform nodules or as an incrustation, or in thin seams and disseminated grains Its mode of occurrence suggests its formation by deposition from solution, and indeed it is sometimes found in stalactitic masses. The typical colour is a delicate sky-blue, but the blue passes by every transition into green. In some cases the colour deteriorates as the stone becomes dry, and may be seriously affected by exposure to sunlight; whilst with age there is often a tendency to become green, as seen in examples of ancient turquoise. The mineral is always opaque in mass, but generally translucent in thin splinters. Turquoise takes a fair polish, but the lustre is feeble, and inclines to be waxy; the hardness is nearly 6, the specific gravity between 2.6 and 2 8

Much discussion has arisen as to the chemical composition of turquoise. It is commonly regarded as a hydrous aluminium phosphate having the composition $2Al_2O_3.P_2O_5.5H_2O$ or rather $Al_2HPO_4(OH)_4$, coloured with a variable proportion of a copper phosphate, or perhaps partly with an iron phosphate. S. L. Penfield (1900), however, was led by careful analysis of turquoise from Nevada to propose the general formula:

$$[Al(OH)_2]_2Fe(OH)_2Cu(OH)_2H]_3PO_4.$$

An analysis of minute crystals from Virginia gave the formula $CuO.3Al_2O_3.2P_2O_5.9H_2O$. An ingenious counterfeit of turquoise has been formed by compressing a precipitate of cupriferous aluminum phosphate.

Turquoise is usually cut as an ornamental stone in circular or elliptical form, with a low convex surface. In the East, where it is used not only for personal ornament but for the decoration of dagger-handles, horse-trappings, etc., the pieces are usually of irregular shape. In Persia, where the finest turquoise is found, the mines have been worked for at least eight centuries. The principal locality is near Nishapur, in the province of Khorasan Here the turquoise occurs in narrow seams in a brecciated trachyte-porphyry. It is found also in some other localities in Persia and in Turkestan. In the Sinai Peninsula relics of extensive ancient mining operations for turquoise show that the rock was at one time worked with flint implements. The mineral here occurs as nodules in a red sandstone and as an incrustation on the joint-faces.

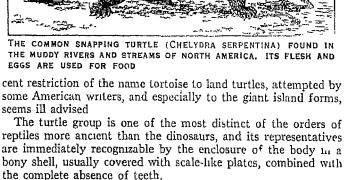
In ancient Mexico much use was made of turquoise as an inlay for mosaic work, with obsidian, malachite, shell and iron pyrites. Relics of extensive workings are found in the mountains of Los Cerillos near Santa Fé in New Mexico, where mining for turquoise is now actively carried on. One of the hills in which old workings occur has been called Mt. Chalchihuitl, since it is believed that the turquoise was known by the name chalchihuitl, which in some places was applied also to jade. The matrix at Los Cerillos is an altered augite-andesite, in which the turquoise occurs in thin veins and in small nodules in patches of kaolin

Turquoise is sometimes termed by mineralogists callaite, since it is believed to be the *callas* of Pliny. The name callamite was suggested by J. D. Dana for a bright green mineral which was found in the form of beads, with stone hatchets, in ancient graves near Mané-er-H'roek (Rock of the Fairy), near Locmariaquer in Brittany, and which A. Damour sought to identify with Pliny's *callais*. The mineral seems to be identical with variscite.

"Bone-turquoise" or odontolite, also known as "occidental turquoise," is merely fossil bone or ivory coloured by iron phosphate (vivianite) or perhaps stained in some cases by cupriferous solutions, and is readily distinguished from true turquoise by showing organic structure under the microscope.

TURRETIN, or **TURRETINI,** the name of three Swiss divines

BENOÎT TURRETIN (1588–1631), was born at Zurich Nov. 9, 1588. He was ordained a pastor in Geneva in 1612, and became a professor of theology in 1618. In 1620 he represented the Genevan church at the national synod of Alais, when the decrees of the synod of Dort were introduced into France; and in 1621 he was sent on a successful mission to the states-general of Holland, and to the authorities of the Hanseatic towns, with reference to the defense of Geneva against threatened attacks of the duke of Savoy. He published in 1618–20 (2 vols.) a defense of the Genevan translation of the Bible, *Eine Verteidigung der genfer Bibeluebersetzung.* He died March 4, 1631.



FRANÇOIS TURRETIN (1623–1687), son of the preceding, was born at Geneva Oct. 17, 1623. He became pastor of the Italian congregation in Geneva in 1647, after a brief pastorate at Lyons he again returned to Geneva as professor of theology in 1653. He was one of the most influential supporters of the *Formula Consensus Helvetica* and of the particular type of Calvinistic theology which that symbol embodied. His *Institutio theologicae elencticae* (3 vols., Geneva 1680–83) passed through frequent editions. He died Sept 28, 1687.

JEAN ALPHONSE TURRETIN (1671–1737), son of the preceding, was born at Geneva Aug. 13, 1671. After travel in Holland, England and France he was received into the "Vénérable Compagnie des Pasteurs" of Geneva in 1693 Here he became pastor of the Italian congregation, and in 1697 professor of church history, and later (1705) of theology. During the next 40 years he was an influential advocate of a more liberal theology, and it was largely through him that the rule obliging ministers to subscribe to the *Formula Consensus Helvetica* was abolished. He died May 1, 1737.

TURRIFF, small burgh, Aberdeenshire, Scotland. Pop (est 1938) 2,562, 38½ mi. N W. of Aberdeen. Only the choir and belfry of the ancient church remain. On May 14, 1639, the national struggle for civil and religious liberty was inaugurated in the county with the skirmish known as the Trot of Turriff. Some 4 mi. S. are the remains of the castle of Towie Barcley.

TURRIS LIBISONIS (modern Porto Torres, an ancient seaport at the N W. extremity of Sardinia. It was probably of Roman origin, and in Pliny's time it was the only colony in the island. A Roman bridge of seven arches, the ruins of a temple (now known as Il Palazzo del Re Barbaro), which an inscription found there shows to have been restored (AD 247–249) by the *praefectus* of the province, together with the basilica, an aqueduct, various buildings and some rock tombs, still exist.

TURTLE, the common name most widely applied to the members of the reptilian order Chelonia (*see* REPTILES), for which the noun and adjective chelonian are also appropriate There is much confusion in the usage of the term "tortoise," which is commonly used in Britain for both land and fresh-water turtles, the term "turtle" being restricted to the marine forms with paddle-shaped fore limbs. In America, with its rich fauna of these creatures, the name turtle was broadened in common usage, as in sea turtle, land turtle, snapping turtle (never "snapping tortoise"), etc, with the addition of the word "terrapin," which is loosely applied to some of the edible fresh-water and brackish-water species that come to markets The relatively re-

THE COMMON SNAPPING TURTLE (CHELYDRA SERPENTINA) FOUND IN THE MUDDY RIVERS AND STREAMS OF NORTH AMERICA. ITS FLESH AND EGGS ARE USED FOR FOOD

cent restriction of the name tortoise to land turtles, attempted by some American writers, and especially to the giant island forms, seems ill advised

The turtle group is one of the most distinct of the orders of reptiles more ancient than the dinosaurs, and its representatives are immediately recognizable by the enclosure of the body in a bony shell, usually covered with scale-like plates, combined with the complete absence of teeth.

The "Shell."—The characteristic "shell" consists of an upper *carapace* and a lower *plastron*, the two being more or less firmly

united at the sides by a bony bridge. Both carapace and plastron proper are structures built up from a number of bone elements firmly united by sutures; the carapace consists of a central row of from 10–12 plates most of which are fused to the vertebrae, a lateral row of 8 plates on each side fused to the ribs and about 23 small plates bordering its free edge; the plastron contains five paired elements and one unpaired. The union of the upper and lower halves of the shell may be rigid and bony or cartilaginous and flexible and in some forms transverse hinges are developed. In the majority of chelonians the bony shell is overlaid by horny plates, but these do not correspond with the underlying bones although their general arrangement is similar; they are of exactly the same nature as the horny scales covering the head, limbs and exposed soft parts.

The shape of the "shell" varies in conformity with the habits of the animal; in strictly terrestrial forms it is usually high, domed, and sufficiently large to permit the head and limbs to be withdrawn into it, whereas in aquatic species, it is generally depressed and so much reduced in size that it may offer little protection for the limbs. Correlated also with the habitat is the shape of the limbs; in terrestrial species they are club-shaped, all the digits being bound together and only externally distinguishable by their claws, whereas in the fresh-water dwellers the digits remain distinct and are connected by a web; the marine turtles have the fingers and toes of the fore limb all bound together and the number of claws reduced, but the whole limb is here transformed into a paddle.

Breathing.—As a result of the development of the shell and the consequent fixation of the ribs the method of breathing is rather different in the Chelonia as compared with other reptiles and resembles that of the Amphibia, air is pumped into the lungs by movements of the hyoid apparatus, which alternately distends and compresses the neck and floor of the mouth and this action is assisted to some extent by the piston-like movements of the head and limbs in and out of the shell when the creature is active. Additional respiratory mechanisms in some aquatic species utilize the oxygen dissolved in the water.

No recent chelonian has teeth, the beak-like jaws being covered with horny plates, which usually have sharp cutting edges, terrestrial species are, as a rule, strictly herbivorous and though many aquatic species are impartial in their feeding habits the majority are carnivorous, many raptorial. The voice is not well developed, females as a rule only being able to hiss; males, however, in the breeding season at least utter cries which in smaller species may be only a feeble piping but in the giant land turtles are hoarse bellows. Reproduction is always by means of eggs. These are spherical and covered by a parchment-like or calcareous shell; they are buried in sand or loose earth.

Species.—There are living at the present day some 225 species but these are probably only the surviving remnant of a formerly much more numerous group. They are cosmopolitan in their distribution except for the more recent oceanic islands and those northern and southern countries where the winter is too severe; in England their extermination seems to have been relatively recent.

One recent chelonian differs from all others in structure of its shell, the elements that normally compose this structure being almost all absent and their function being assumed by a mosaic of small polygonal plates. On this account the animal was placed in a separate group, the ATHECAE, to contrast with the others which are united as the THECOPHORA. This creature, the luth or leathery turtle (*Dermochelys coriacea*) is a marine turtle inhabiting tropical seas and is the largest living chelonian; it reaches a length of 8 feet and may weigh nearly a ton; the back is devoid of horny plates and is covered by soft skin, the food consists of molluscs, crustaceans and fishes. The eggs, like those of other marine turtles, are laid on land; the female repairs to a sandy beach during the night, digs a shallow hole in which the eggs are deposited, covers them up, and returns to the sea; the chief breeding places appear to be on the coasts of tropical islands.

Thecophora.—The remaining turtles are subdivisible into 3 main groups: the Trionychoidea, aquatic forms with a bony carapace and plastron but without horny plates; the Cryptodira, terrestrial and aquatic forms with a bony carapace and plastron covered with horny epidermal shields and retracting the neck by a vertical S-shaped bend; and the Pleurodira, resembling the Cryptodira but retracting the neck by a simple lateral flexure. Of these groups the Cryptodira contains the largest number and the majority of the typical tortoises; its various families, based largely on characters of the bony shell, may be recognized by the following key based on external characters only.

I. Digits more or less distinct with 4 or 5 claws, terrestrial or fresh-water.

A. Pectoral shield (the 3rd paired shield of the plastron) separated from the marginal shields of the carapace by a series of small "infra-marginal" plates.

(1) Tail long and crested; plastron small and cruciform. American. *Chelydridae*

(2) Tail long, covered with rings of scales; plastron large. Asiatic. *Platysternidae*

(3) Tail short. North American. *Kinosternidae.* *Dermatemydidae.*

B. Pectoral shields in contact with the marginals of the carapace. *Testudinidae*

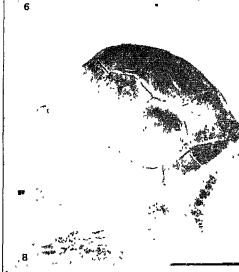
II. Fore limbs paddle-shaped with one or two claws, marine. *Chelonidae.*

Chelydridae.—The snapping turtles are fresh-water forms of North and Central America, characterized by relatively huge heads, long alligator-like tails, rough shells and numerous soft projecting folds of skin on the neck and limbs. The two better known species, the common snapper (*Chelydra serpentina*) of the eastern United States and the alligator snapper (*Macrochelys temminckii*) of the Mississippi and Missouri basins, are both large, powerful creatures, and notorious for their aggressive nature and the power of their jaws.

Platysternidae.—A single species (*Platysternon megacephalum*), the big-headed turtle, is found in fresh waters in S. China, Burma and Siam. The head is relatively very large and the neck short.

Kinosternidae.—These are the musk turtles of North and Central America, so called from the rather offensive odour of the secretion of their inguinal glands; they are small, aquatic creatures, rarely exceeding a total length of one foot and in many the front and hind lobes of the plastron are hinged and close the shell completely. *Sternotherus odoratus*, the stinkpot of eastern North America, is the best known species

Dermatemydidae.—A single type of large Central American fresh-water turtle allied to the preceding family



Testudinidae.—This family, containing the majority of turtles, is world wide in its distribution except the Australian region, and its members show all gradations between thoroughly aquatic and exclusively terrestrial species. The batagur (*Batagur baska*) of Bengal, Burma and the Malayan region is exclusively aquatic; it attains a length (carapace only) of nearly 2 feet, is rather flattened and has the digits fully webbed. *Chrysemys* of eastern N. America is also exclusively aquatic and the species of this and allied genera are extensively eaten; they are sold as "slider terrapins" to distinguish them from the diamond back terrapins (*Malaclemys*) beloved by epicures.

Clemmys, with species in S. Europe and N. Africa (*C. leprosa*), Asia and N. America (e.g., *C. insculpta* the wood turtle), is less aquatic than the preceding and the digital webs are correspondingly reduced. Still less aquatic are the species of *Emys*, *E. orbicularis* of Central Europe and Western Asia and *E. blandingi* of southern Canada and the north-eastern United States, which have indications of a transverse hinge across the plastron. This plastral hinge reaches a high degree of development in the North American box turtles (*Terrapene*) which can withdraw completely into their shell and close both openings; these animals are terrestrial in habits and have the high, domed shell of the exclusively terrestrial genera such as *Kinixys*, *Pyxis* and *Testudo*. *Testudo* is an assemblage of herbivorous, terrestrial forms and contains, among others, the well-known giant land turtles, some of which reach a shell length of over 4 feet and may weigh over

MARINE, FRESH-WATER AND TERRESTRIAL TURTLES

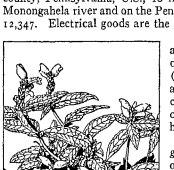
1. A museum group showing a loggerhead turtle swimming amongst sharks
2. Green turtle, caught by natives off the island of Tahiti. This is the species most frequently eaten
3. The Cumberland terrapin, an edible species inhabiting the fresh waters of central North America
4. The matamata, a large South American fresh-water turtle characterized by a rough shell and by fleshy filaments and appendages on the head and neck
5. Newly-hatched snapping turtles and eggs. These turtles, which inhabit the fresh waters of North America, have large heads and long tails
6. Soft-shelled turtle swimming. These animals, characterized by a disk-shaped body covered with soft skin, frequent slow-running rivers, lakes and ponds
7. Australian snake-necked turtle. This species and its allies are found only in fresh waters and are remarkable for their extremely long necks
8. Seychelles giant land turtle. Giant land turtles are now almost extinct, a few only surviving in a wild state on Aldabra and on the Galapagos Islands
9. Leathery turtle or luth (leatherback), the largest marine turtle. The bony shell is composed of numerous small bones instead of the usual regular plates

600 lb. There were three groups of these animals, one confined to the islands of the Galapagos Group where every small island had its own race and the largest several, another to the Mascarene Islands (Bourbon, Mauritius, Rodriguez) and the third to the Seychelles-Aldabra Group Before the advent of man these creatures abounded in almost incredible numbers, but it was soon discovered that, on account of their ability to live for months without food, they formed an excellent supply of easily transported fresh meat for sailing vessels and their numbers were rapidly decimated

Somewhat approaching the giant island forms in size are the African *T. calcarata* and the South American *T. tabulata* but the remaining species of the genus are relatively small, *T elegans*, the Indian star turtle, is black with yellow streaks radiating from the centre of each shield and the South African *T. geometrica* has a similar pattern; in Europe there are 2 species, *T. hermanni* of S. Europe and Asia Minor and *T. margmata* of Greece, the species commonly imported into England being *T. graeca* of northern Africa and Asia Minor. The N. American gopher turtles (*T. polyphemus*, *T. berlandieri* and *T. agassizii*) are burrowing creatures inhabiting dry, sandy country and constructing their own burrows, but the greatly flattened and soft-shelled East African *T. tornerı* is cryptozoic in rocky country and hides in crevices.

Chelonidae.—The three common species are the hawksbill (*Eretmochelys imbricata*), the green turtle (*Chelonia mydas*) and the loggerhead (*Caretta caretta*). Of these, the first mentioned may be distinguished by its smaller size, the overlapping horny plates of the back and the hooked beak; it occurs in all tropical seas and is the source of the "tortoise shell" of commerce. The horny shields of the carapace are stripped off by heat and when heated in oil or by steam they can be welded together to form slabs thick enough for manufacturing purposes. The green turtle is the species used so much in the manufacture of turtle soup; it is a larger species than the hawksbill, attaining a length of close to 4 feet and the horny plates of the back do not overlap but meet edge to edge. All these turtles have the same general habits and distribution, the green turtle only is partially or entirely herbivorous, feeding on *Zostera* the marine grass, the others preferring fish or molluscs. All lay their eggs in pits dug by the females on sandy beaches which are visited at night and it is then that large numbers are captured; the eggs, too, are edible so that in some regions the turtles are becoming scarce.

Pleurodira.—I. Neck completely retractile into the shell.
Pelomedusidae.



II. Neck long, not hidden by the shell when retracted.
Cheilidae.

Pelomedusidae, fresh-water dwellers in Africa and South America; *Pelusios* of Tropical Africa and Madagascar has the front lobe of the plastron hinged but *Pelomedusa* of the same regions lacks this character. *Podocnemis*, similar to *Pelomedusa*, inhabits the rivers of tropical S. America and reaches a considerable size.

Chelidae, the "Snake-Necked Turtles" of the fresh waters of S. America, Australia and Papua. They are all long-necked creatures with the typical depressed shells of aquatic tortoises, the many species are superficially very similar, the S. American matamata (*Chelys fimbriata*) alone showing any peculiarities

Trionychoidea.—This group contains the two families Carettochelidae, in which the complete carapace and plastron are covered with soft skin, and the soft-shelled turtles proper, the Trionychidae, in which the bony elements of the shell are much reduced and are enclosed in a flexible dermal and cartilagmous external covering. *Carettochelys insculpta*, of the Fly river in New Guinea, has paddle-shaped fore limbs, like a marine turtle. The soft-shelled turtles, with several genera in Africa and Asia, are represented in northern Asia, Africa, and North America by the genus *Trionyx*. These actively swimming turtles are remarkably flattened, with broadly webbed fore and hind feet, and emerge from the water only to sun themselves and for egg-laying. All are strictly confined to fresh waters, and mostly to sluggish streams and lakes. The snout is prolonged to form a short breathing tube. Most of the species are fish eaters, but mollusc-eating may produce the broad crushing jaws of certain individuals. A remarkable feature of the African *Cyclanorbis* and *Cycloderma* and the Indian *Lissemys* is the provision for retracting the hind limbs within the shell, the opening closing by a valve-like cartilaginous flap, while the front limbs can also be more or less completely withdrawn. (H. W. P ; K. P. S.)

TURTLE CREEK, a manufacturing borough of Allegheny county, Pennsylvania, U.S., 10 mi S E. of Pittsburgh, near the Monongahela river and on the Pennsylvania railroad Pop (1950) 12,347. Electrical goods are the principal products

BY COURTESY OF THE WILD FLOWER PRESERVATION SOCIETY
THE COMMON TURTLEHEAD, OR SNAKEHEAD, (CHELONE GLABRA)

TURTLEHEAD (*Chelone*), a genus of North American herbs of the family Scrophulariaceae (*q.v.*), comprising four species, all smooth perennials which bear clusters of showy flowers, the corolla resembling a turtle's head

The common turtlehead (*C. glabra*), with white flowers, occurs from Newfoundland to Manitoba and southward. *C Lyoni* and *C obliqua*, of the southeastern states, and *C. nemorosa*, found from California to Washington, have red or purple flowers.

TURTON, urban district, Darwen parliamentary division, Lancashire, England, 4 mi N of Bolton on the L M S R. Pop (1938) 11,190. Area 2·09 sq mi. It manufactures cotton goods and there are large stone quarries in the vicinity.

Turton tower, containing some fine contemporary woodwork, dates from the 16th century

TUSCALOOSA, a city of western Alabama, U S , the county seat of Tuscaloosa county; on the Warrior river and federal highways 11, 43 and 82 and state highways 171, 13 and 69; 58 mi. S W of Birmingham It is served by the Louisville and Nashville, the Gulf, Mobile and Ohio, and the Southern railways, by bus lines, federal barge lines and barge companies operating on a year-round route to the sea on Warrior-Tombigbee rivers There is a municipal airport, Hargrove van de Graaf field, and one private airport, Christian airport (airport facilities and seaplane base). Pop. (1950) 46,364; (1940) 27,493; (1930) 20,659 by federal census. The city lies at the edge of the great coal and mineral deposits of Alabama in a rich agricultural region.

Industrial development began after the removal of the state capital in 1846 In the county there are a large paper mill, a pipe foundry, cotton yarn mill, veneer mills, coke ovens, meat-packing plants, tire plant, roofing plant, oil refinery, chemical plant, furniture factory, feed mills and other plants. The cotton industry, lumbering, mining and forestry also flourish

There are many old residences and gardens, dating from the time Tuscaloosa was the capital of the state (1826–46). The streets are wide and lined with magnificent old oaks, planted in the early days of settlement. Tuscaloosa has often been referred to as "The Druid City"

In Tuscaloosa are the Bryce hospital and Partlow state school (major units of the Alabama state hospitals), a United States veterans' hospital; Stillman college (Presbyterian, endowed school for Negroes); and the University of Alabama.

The university was first opened to students in 1831. The campus proper covers 420 ac. and the Northington campus annex comprises 150 ac.

The name of the town and the river comes from two ancient Choctaw words, *tusha* ("warrior") and *lusa* ("black") Chief Tuskalusa was a gigantic, courageous Choctaw chieftain who was defeated by de Soto in 1540 He is commemorated by a granite monolith on the courthouse lawn at Tuscaloosa. The first white settlers arrived in 1816, the date the area became the property of the United States by a treaty with the Indians. The county of Tuscaloosa was created in 1818; the town of Tuscaloosa was incorporated Dec. 13, 1819, one day before the state of Alabama was admitted to the union.

TUSCANIA, a town of the province of Viterbo, Italy, 15 mi. N.E. of Corneto by road, 545 ft. above sea level Population (1936), 5,260 (town), 5,775 (commune) The ancient town lay on the Via Clodia; its Etruscan tombs have yielded valuable antiquities, and remains of a large thermal establishment of the Roman period have also been found. The mediaeval walls with their towers are still preserved

On the ancient citadel hill is the Romanesque church of S Pietro, belonging to four different periods—739, 1093 (the date of the reconstruction of the crypt), the middle of the 12th and the end of the 13th century.

It has the shape of a Roman basilica, with a nave and two aisles and one apse The elaborate façade with its rose window also belongs to the 12th century

S Maria in the valley below dates from 1050 to 1206, and has a similar façade and a massive square campanile. In the town are two other Romanesque churches. The town was called Toscanella until 1912, when it resumed the name which it bore in ancient Latin times.

TUSCANY (*Toscana*), a territorial division of Italy, consisting of the western part of the centre of the peninsula, bounded northwest by Liguria and Emilia, east by the Marches and Umbria, southeast by the district of Lazio and west by the Mediterranean.

It consists of nine provinces, Apuania, Arezzo, Firenze (Florence), Grosseto, Livorno (Leghorn), Lucca, Pisa, Pistoia and Siena, and has an area of 8,859 sq mi. Pop. (1936) 2,974,439 (showing a very low relative increase since 1901). The chief railway centre is Florence.

Except towards the coast and around Lucca, Florence and Arezzo, where the beds of prehistoric lakes form plains, the country is hilly, being intersected with sub-Apennine spurs, some of which have extensive forests

The most fertile country in Tuscany is in the valley of the Arno. In the neighbourhood of Lucca the irrigation system dates from 1376, while at Coltano, near Pisa, it goes hand in hand with land reclamation.

In strong contrast with this is the coast plain known as the Maremma, 850 sq mi. in extent, where malaria has been prevalent since the depopulation of the country in the middle ages An elaborate system of drainage, begun in the 19th century, is still being completed.

The greater part of the Maremma now affords pasture to large herds of horses and half-wild cattle, but the drier parts are cultivated. The hill country just inland, especially near Volterra, has poor soil, largely clayey, and subject to landslips, but is rich in minerals, boric acid and mineral springs.

But for the Maremma, Tuscany is one of the most favoured regions of Italy. The climate is temperate, and the rainfall not excessive.

The following is a list of the chief agricultural products in 1938 (the wine is largely produced in the district of Chianti, south-southwest of Florence):

	Area	Tons
	Acres	
Wheat	804,747	608,690
Rye	14,573	7,716
Barley	20,095	12,236
Oats	85,462	58,642
Maize	185,497	271,166
Beans	176,851	54,454
Sugar beets	12,597	105,821
Garden produce	377,910	99,979
Potatoes	58,045	183,423
Tobacco	4,199	
Forage	1,219,933	2,202,616
Vines	1,183,377	118,032,765 (wine, gal)
Olives	585,143	5,547,730 (olive oil, gal.)

The chief mineral products of the Florence district (including the provinces of Siena, Grosseto and Livorno [Leghorn]) are iron, manganiferous iron, copper, mercury (from Monte Amiata), iron pyrites, marble (chiefly from the Carrara or Apuania district), lignite (provinces of Arezzo and Grosseto) There are cotton mills at Florence, Leghorn, Prato and Pisa; Prato (*q.v.*) is an important centre of the wool industry, which furnished more in Florence in the middle ages than at present Hydro-electric power, mainly derived from the Serchio basin, is supplemented by the plants at Terni (*q.v.*) in Umbria Glass is made at Pisa. Porcelain and ceramic products are made, especially at Signa and Doccia, near Florence, where silk, straw hats, etc, are also manufactured, and much furniture is also produced. The Tuscans are, indeed, active, both in agriculture and industry There are universities at Florence, Pisa and Siena Viareggio and Leghorn are much frequented for sea-bathing, while the latter is a prosperous port.

The main art centres of Tuscany are Florence, Pisa and Siena, the headquarters of the chief schools of painting and sculpture from the 13th century onwards. While the first city, however, bore as prominent a part as any in Italy in the Renaissance, the art of Pisa ceased to advance at a comparatively early period, its importance being in ecclesiastical architecture in the 12th, and in sculpture in the 13th century. Siena, too, never accepted the Renaissance to the full, and art retained its individuality.

The Tuscan language is remarkable for purity of idiom, and its adoption by Dante and Petrarch probably led to its becoming the literary language of Italy. (*See* ITALIAN LANGUAGE, MODERN.)

Jahrhundert* (6 vols); B. Patzak, *Palast und Villa in Toscana* (2 vols., 1912–13). (T. A.)

HISTORY

Etruria (*q.v.*) was finally annexed to Rome in 351 B.C and was later known as Tuscia, but was a larger area than the present Tuscany, comprising the northern part of Latium. Under Charlemagne the name of Tuscia or Toscana became restricted to the area north of Viterbo and Bolsena One of the earliest of the Frankish marquises in the 9th century was Boniface, who about 828 fought with success against the Saracens in Africa The male line of marquises ended with Boniface II (or III), who was murdered in 1052. His widow, Beatrice, in 1055 governed the country till her death in 1076, when she was succeeded by Matilda (*q.v.*), her only child by her first husband. Matilda died in 1115 without issue, bequeathing all her extensive possessions to the Church. The consequent struggle over her inheritance between the popes and the emperors enabled the principal cities of Tuscany gradually to assert their independence, so that Tuscany as a whole was no longer a state.

The Return of the Medici.—After the surrender of Florence to the Imperialists in Aug. 1530 the Medici power was re-established, and Alessandro de' Medici was made duke of Florence, the dignity to be hereditary in the family. In the reign of Cosimo III Siena was annexed (1559); the title of grand duke of Tuscany was conferred on that ruler in 1567 by Pope Pius V and recognized in the person of Francis I by the emperor Maximilian II in 1576.

Under his descendants Tuscany played but a small part in European history; a wave of degeneracy set in, affecting both the people and the new and shoddy nobility, and art and letters declined. Giovan Gastone, the last Medicean grand duke, being childless, it was agreed by the treaty of Vienna that at his death Tuscany should be given to Francis, duke of Lorraine, husband of the archduchess Maria Theresa, afterwards empress In 1737 Giovan Gastone died, and Tuscany was governed for Francis II, who resided in Austria, by a series of foreign regents. (The history of Tuscany from 1530 to 1737 is given in greater detail under MEDICI.)

Reforms of Leopold I.—Francis, who had been elected emperor in 1745, died in 1765 and was succeeded on the throne of the grand duchy by his younger son, Leopold I. Leopold resided in Tuscany and proved one of the most capable and remarkable of the reforming princes of the 18th century. He sub-

stituted Tuscans for foreigners in government offices, introduced a system of free trade in foodstuffs (at the suggestion of the Sienese Sallustio Bandini), and promoted agriculture. He reorganized taxation on a basis of equality for all citizens, reformed the administration of justice and local government, and suppressed torture and capital punishment. His reforms in Church matters made a great stir at the time, for he curbed the power of the clergy, suppressed some religious houses, reduced the mortmain, and rejected papal interference. With the aid of Scipione de' Ricci, bishop of Pistoia, he even attempted to reform Church discipline, but Ricci's action was condemned by Rome and he was forced to resign. (*See* PISTOIA, SYNOD OF.) At the death of his brother, Joseph II, in 1790, Leopold became emperor and removed to Vienna. After a brief regency he appointed his second son, Ferdinand III, grand duke

The French Occupation.—During the French revolutionary wars a French force entered Florence in 1799 and was welcomed by a small number of republicans. The grand duke was forced to fly, and a provisional government on French lines was established But the great mass of the people were horrified at the irreligious character of the new régime, and a counter-revolution broke out at Arezzo Bands of armed peasants marched through the country to the cry of "Viva Maria!" and expelled the French, not without committing many atrocities. With the assistance of the Austrians Florence was occupied and a government established in the name of Ferdinand. But after Bonaparte's victory at Marengo the French returned in great force, dispersed the bands, and reentered Florence (Oct. 1800) They, too, committed atrocities and sacked the churches, but they were more warmly welcomed than before by the people, after the experience of Austro-Aretine rule. Joachim Murat set up a provisional government, and by the peace of Lunéville (*q.v.*) Tuscany was made a part of the Spanish dominions and erected into the kingdom of Etruria under Louis, duke of Parma (1801). The new king died in 1803, leaving an infant son, Charles Louis, under the regency of his widow, Marie Louise of Spain Marie Louise ruled until 1807, when the emperor Napoleon obliged Charles IV of Spain to cede Tuscany to him, compensating Charles Louis in Portugal.

From 1807 to 1809, when Napoleon's sister, Elisa Baciocchi, was made grand duchess, Tuscany became a French department. French ideas had gained some adherents among the Tuscans, but to the majority the new institutions, although they produced much progress, were distasteful as subversive of cherished traditions After Napoleon's defeats in 1814, Ferdinand III returned, warmly welcomed by nearly everybody, for French rule had proved oppressive, especially on account of the heavy taxes and the dram of conscription. At the Congress of Vienna he was formally reinstated with certain additions of territory and the reversion of Lucca (incorporated in 1847).

The Restoration.—The restoration in Tuscany was unaccompanied by the excesses which characterized it elsewhere, and much of the French legislation was retained. Ferdinand was succeeded in 1824 by his son, Leopold II., who continued his father's policy of benevolent but enervating despotism When the political excitement consequent on the election of Pius IX spread to Tuscany, Leopold, in Feb. 1848, granted a constitution. A Tuscan contingent took part in the Piedmontese campaign against Austria, but the increase of revolutionary agitation in Tuscany, culminating in the proclamation of the republic (Feb. 9, 1849), led to Leopold's departure for Gaeta to confer with the pope and king of Naples. Disorder continuing, he was invited to return, and he did so, but accepted the protection of an Austrian army, by which act he forfeited his popularity (July 1849). In 1852 he formally abrogated the constitution, and three years later the Austrians departed When in 1859 a second war between Piedmont and Austria became imminent, the revolutionary agitation broke out once more. There was a division of opinion between the moderates, who favoured a constitutional Tuscany under Leopold, but forming part of an Italian federation, and the popular party, who aimed at the unity of Italy under Victor Emmanuel. At last a compromise was arrived at and the grand duke was requested to abdicate in favour of his son, grant a constitution, and take part in the war against Austria. Leopold having rejected these demands, the Florentines rose as one man and obliged him to quit Tuscany (April 27, 1859).

Union with the Italian Kingdom.—A provisional government, led by Ubaldino Peruzzi and afterwards by Bettino Ricasoli, was established. It declared war against Austria and then handed over its authority to Boncompagni, the Sardinian royal commissioner (May 9). A few weeks later a French force under Prince Napoleon landed in Tuscany to threaten Austria's flank, but in the meanwhile the emperor Napoleon III made peace with Austria and agreed to the restoration of Leopold and other Italian princes. Victor Emmanuel was obliged to recall the royal commissioners, but together with Cavour he secretly encouraged the provisional governments, and the constituent assembly of Tuscany voted for annexation to Sardinia The king accepted the annexation and appointed his kinsman, Prince Carignano, viceroy of Central Italy, with Ricasoli as governor-general (March 22, 1860). On Feb. 18, 1861, the kingdom of Italy, comprising Tuscany, was proclaimed.

TUSCARORA, an Indian tribe of Iroquoian family, originally numbering 5,000, in North Carolina. Encroachments by the whites, including kidnapping of their children as slaves, led to a war with the settlers (1711–13), at the end of which the Tuscarora fled or drifted northward and were admitted into the League of the Iroquois as a sixth nation. About 700 survive in Canada and New York.

TUSCULUM, an ancient city of Latium, in a commanding position on the north edge of the outer crater ring of the Alban volcano, 1½ m. N.E of the modern Frascati. The highest point is 2,198 ft. above sea-level. It has a very extensive view of the Campagna, with Rome lying 15 m. distant to the north-west. Rome was approached by the Via Latina (from which a branch road ascended to Tusculum, while the main road passed through the valley to the south of it), or by the Via Tusculana.

According to tradition, the city was founded by Telegonus, the son of Ulysses and Circe. When Tarquinius Superbus was expelled from Rome his cause was espoused by the chief of Tusculum, Octavius Mamilius, who took a leading part in the formation of the Latin League, composed of the thirty principal cities of Latium, banded together against Rome. Mamilius commanded the Latin army at the battle of Lake Regillus (497 B.C.), but was killed, and the predominance of Rome among the Latin cities was practically established. In 381 B.C., the people of Tusculum received the Roman franchise. Several of the chief Roman families were of Tusculan origin, *e.g.*, the gentes Mamilia, Fulvia, Fonteia, Juventia and Porcia (to which the Catos belonged). By the end of the Republic, and still more during the imperial period, the territory of Tusculum was one of the favourite places of residence of the wealthy Romans. The number and extent of the remains is very great. Even in the time of Cicero we hear of eighteen owners of villas there. Much of the territory (including Cicero's villa), but not the town itself, which lies far too high, was supplied with water by the Aqua Crabra. On the hill of Tusculum itself are remains of a small theatre (excavated in 1839), with a reservoir behind it, and an amphitheatre. Both belong probably to the imperial period, while a temple (the substructures of which are preserved), often called the villa of Cicero, or of Tiberius, near the latter, is probably earlier. Between the amphitheatre and the theatre lay the Forum. The citadel—which stood on the highest point, an abrupt rock—was approached only on the side, towards the city. Upon it remains of the mediaeval castle, which stood here until 1191, are visible

It was here that Cicero composed his *Tusculan Disputations* and other philosophical works. His villa must have been at or near Grotta Ferrata and what is now known as Poggio Tulliano a little to the east (where remains of a villa exist) may well have been its site. After the transference of the seat of empire to

Constantinople, Tusculum became an important stronghold, and in the 10th–12th centuries its counts occupied a leading position in Rome. During the 12th century there were constant struggles with Rome, but in 1191 the Romans destroyed the city

See L. Canina, *Descr. dell' antico Tusculo* (Rome, 1841); A. Nibby, *Dintorni di Roma*, 2nd ed., iii, 203 (Rome, 1841); H. Dessau in *Corp. inscript. lat.*, pp 252 *seq* (Berlin, 1887); F Grossi-Gondi, *Il Tusculano nell' età classica* (Rome, 1907), T Ashby in *Papers of the British School at Rome*, iv, v (London, 1907, 1909). (T. A.)

TUSKEGEE, a city of Alabama, U S. Pop. (1950) 6,840; (1940) 3,937 It is the seat of a U S. veterans' hospital for Negroes and of Tuskegee institute (*q.v.*)

TUSKEGEE INSTITUTE, located in Macon county, Ala., about 40 mi. northeast of Montgomery, was founded in 1881 by Booker Tahaferro Washington (*q.v.*) as a coeducational industrial and normal school for Negroes. The institute, covering about 5,000 ac. in its campus and farming lands, had at mid-20th century an endowment of approximately $20,000,000, an enrolment of 2,500 and a faculty of more than 200. It is the home of the George Washington Carver foundation, created by Carver for research in natural sciences. There Carver carried on his own work from 1896 to 1943. Washington headed the institute from 1881 until the time of his death in 1915. During World War II, the army air forces established a training school for Negro pilots at the institute, and a reserve officers' training corps was installed.

(F. D. P.)

TUSSAUD, MARIE (1760–1850), founder of "Madame Tussaud's Exhibiton" of wax figures in London, was born in Berne in 1760, the daughter of Joseph Grosholtz She began to model figures for her uncle, J. C. Curtius, in Paris. Marie Grosholtz modelled the heads of many of the prominent leaders and victims of the Revolution, and was herself for three months a prisoner. In 1794 she married a Frenchman named Tussaud, from whom she was separated in 1800. She then moved to London, taking with her the nucleus of her collection. Her wax figures were first shown in the Strand and through the provinces, and finally the exhibition was established in permanent London quarters in Baker street in 1833. Here Mme. Tussaud died on April 16, 1850. The exhibiton was moved in 1884 to a large building in Marylebone road.

See J. T. Tussaud, *The Romance of Madame Tussaud* (1920).

TUSSER, THOMAS (*c.* 1524–1580), English poet, son of William and Isabella Tusser, was born at Rivenhall, Essex, about 1524. He was a chorister at Wallingford castle, and then at St. Paul's cathedral, and from there went to Eton college He was elected to King's college, Cambridge, in 1543, moved to Trinity hall, and on leaving Cambridge went to court in the service of William, 1st Baron Paget of Beaudesart, as a musician. After ten years of life at court, he married and settled as a farmer at Cattiwade, Suffolk, near the river Stour, where he wrote his *Hundreth Good Poinies of Husbandrie* (1557, 1561, 1562, etc). For his wife's health he moved to Ipswich. After her death he married again, and farmed at West Dereham. After farming at Fairsted, Essex, he moved to London. Thomas Fuller says he "spread his bread with all sorts of butter, yet none would stick thereon." He died on May 3, 1580.

The *Hundreth Good Poinies* was enlarged to *A Hundreth good poinies of husbandry, lately maried unto a hundreth good poynies of huswifery . . .* the first extant edition of which, "newly corrected and amplified," is dated 1570. In 1573 appeared *Five hundreth poinies of good husbandry . . .* (reprinted 1577, 1580, 1585, 1586, 1590, etc.). The numerous editions of this book, which contained a metrical autobiography, prove that the homely and practical wisdom of Tusser's verse was appreciated. The later editions include *A dialogue of wyuynge and thryuynge* (1562). Modern editions are by William Mavor (1812), by H. M. W. (1848), and by W Payne and Sidney J. Herrtage for the English Dialect Society (1878)

TUTBURY, town, Burton parliamentary division Staffordshire, England, 4½ mi N.W. of Burton-upon-Trent, picturesquely situated on the river Dove. Pop. of rural district (1938) 12,360. It is on the L.N.E. and L.M.S. railways, but the railway station is in Derbyshire. The fine church of St Mary has a nave of rich Norman work Glass is the staple manufacture. Alabaster is found in the neighbourhood.

Tutbury is said to have been a seat of the Mercian kings. It gave its name to an honour in Norman times Domesday shows it in the hands of Henry de Ferrers, in whose family the town and castle remained until 1266, when they were forfeited to the crown and granted to Edmund Crouchback, earl of Lancaster. They are still part of the duchy of Lancaster. John of Gaunt frequently resided at Tutbury castle Later it was, for a time, the prison of Mary Queen of Scots. During the Civil War it was held for the king but surrendered to the parliamentary forces (1646), and was reduced to ruins (1647), though the gateway still remains.

TUTENKHAMON (sometimes spelled TUTANKHAMUN, or TUT-ANKH-AMEN), son-in-law of the Pharaoh, Ikhnaton (*q.v.*), and himself Pharaoh for not less than six years in the middle of the fourteenth century B C. The fame of this politically unimportant sovereign is due to the discovery of his tomb still containing the larger part of its magnificent equipment Even in Egypt, the survival of royal burial equipment is unique; for the plundering of royal tombs began at a remote date. A pyramid is a gigantic husk of masonry to protect the body of the Egyptian sovereign; but not a single pyramid escaped plundering by the ancient tomb-robbers The Egyptian rulers, therefore, abandoned the pyramid and excavated the kings' tombs in the face of the Nile cliffs For four hundred years the excavation of these royal cliff-tombs continued; by 1150 B.C. there were over half a hundred

After the fall of the Empire about 1150 B C not a single known royal tomb was left intact.

The preservation of the burial of Tutenkhamon was due to accident, to its small size and to the unimportance of its occupant. The demoralisation of the government at the death of Tutenkhamon, about 1350 B.C., was such that the cemetery ghouls found no difficulty in robbing his cliff-tomb. Fortunately they were caught in the act, and much of their plunder was returned, although the heavy golden vessels and much other magnificent work was evidently too great a temptation for the officials. The tomb was never molested again, and two hundred years later, when the Empire was tottering, the architects of Rameses VI, excavating the tomb of this Pharaoh just above that of Tutenkhamon, ordered the workmen to throw their waste limestone chips down the slope below it, thus completely covering up the tomb of Tutenkhamon

The expedition which discovered the tomb of Tutenkhamon was maintained by Lord Carnarvon (*q.v.*), but the actual discovery was due to Howard Carter (*q.v.*), who on November 4, 1922 uncovered the steps leading down to the entrance gallery. For eight seasons (October to April) following, Carter salvaged this magnificent treasure, nearly all of which is now at the national museum in Cairo. The body of the youthful Pharaoh still lies in his beautiful stone sarcophagus in the burial chamber of his tomb The stone lid has not been replaced, and the gorgeous outer coffin, richly wrought in gold, is a unique and impressive sight.

The mortuary furniture of Tutenkhamon will continue to make his name a household word, notwithstanding his lack of political significance. He owed his succession to the throne to his marriage with Ikhnaton's third daughter, and he must have been hardly twelve years old when he was crowned. A helpless puppet in the hands of the priestly party which was vindictively striving to exterminate his father-in-law's memory, the boy king had little chance to survive. The examination of his mummy showed that he was about eighteen years old at his death, after a reign of probably not more than six years. The body showed no discernible traces of foul play.

BIBLIOGRAPHY.—*Content of the Tomb:* Prellminary publications: Howard Carter and A C Mace, *The Tomb of Tutankhamen*, Vol. I (1923); Howard Carter, *The Tomb of Tutankhamen*, Vol. II (1927). A full detailed publication of the content of the tomb has not yet been begun

Woolley, *The City of Akhensten*, Vol. I (1923); G. van der Leeuw, *Achnaton* (1927). (J H. Br.)

TUTICORIN, a seaport of British India in the Tinnevelly district of Madras. Pop. (1941) 75,614. It is the southern ter-

minus of the South Indian railway, 443 m. S.W. of Madras city. Tuticorn is an old town, long in possession of the Dutch, and has a large Roman Catholic population. It used to be famous for its pearl fisheries and pearl fishing was again engaged in successfully in 1926. There are industrial and training schools. Salt is manufactured, cotton woven, and there are cotton ginning and pressing factories. Tuticorin is the 2nd port of Madras. A deep-water harbour was in process of construction in 1927.

TUTTLINGEN, a town of Germany, in the *Land* of Württemberg, on the left bank of the Danube, 37 mi. by rail N.E. of Schaffhausen, and at the junction of lines to Stuttgart and Ulm. Pop. (1939) 18,096. Its chief manufactures are shoes, cutlery, surgical instruments and woollen goods.

TUXEDO, a town of Orange county, New York, U.S.A., 40 mi. N.N.W. of New York city; served by the Erie railroad. Pop 1950, 2,183 federal census. About 1¼ mi. from the station is Tuxedo lake, in a tract of 13,000 ac. which was taken for debt by the elder Pierre Lorillard in 1814 He built a shooting box here, and his grandson Pierre formed the Tuxedo Park Association, which resulted in the formation of the Tuxedo club and the opening (June 1, 1886) of Tuxedo park.

TÚY, a city of north-western Spain, in the province of Pontevedra, on the right bank of the river Miño, opposite Valença do Minho in Portuguese territory. Pop. (1940), 2,871 (mun, 13,500). During part of the 7th century Túy was the Visigothic capital. Túy is the southern terminus of the railways to Santiago de Compostela and Corunna; Valença do Minho is the northern terminus of the Portuguese railway to Oporto To the east of Túy is the river Louro; and beyond the Louro, on the railway to Corunna, are the hot mineral springs of San Martín de Caldelas. The cathedral is of a fortress-like architecture.

TUZLA or **DONJI SOLI,** a town of Bosnia, Yugoslavia, beautifully situated on the Jala or Julla. Pop. (1931) 16,711, almost all being Muslims. Tuzla is the seat of a district court and an Orthodox bishop, with several churches, many mosques, a hospital, gymnasium and commercial school. Besides a large ammonia soda factory, and the generating of electric power, it has a vigorous trade in grain, live stock, plums, bricks, etc.

TVA, the abbreviation for Tennessee Valley Authority. *See* ELECTRICAL POWER: NATIONAL AND REGIONAL SCHEMES; SOUTH, THE.

TVER (now KALININ), a region of the Russian S.F.S.R., surrounded by those of Smolensk, Leningrad, Vologda, Yaroslavl and Moscow, and not coinciding with the pre-1917 province of that name. Area 41,081 sq mi. Pop. (1939) 3,211,439 (urban 702,704; rural 2,508,735) mainly Great Russians, with Karelians in the north. The climate is continental, with severe winter frosts of five months' duration and an average July temperature of 67° F. Average rainfall 18–20 in. per annum. Coniferous forests, especially firs, cover 32.2% of the region, and 12% is marsh land In the remaining area meadow and grassland prevail, ploughed land occupying only 25%. There has been a marked diminution of grain production and a tremendous increase in the cultivation of long-fibred flax with the use of mechanized equipment on collective farms. Clover, sown alternately with flax to renew soil fertility, is the basis for a developing dairy industry.

Hunting and fishing supplement the income of the peasants, and there are koustar (peasant) industries of leather and fur preparation, textiles and wooden wares. Factory industries include sawmilling, flour-milling, leather goods, textiles, bricks, glass, machinery, oil-pressing and brewing. Main cities: Tver (Kalinin), pop. (1939) 216,131; Rzhev 54,081; Vyshni-Volochok 63,642.

The region is well drained by the upper Volga and its tributaries, especially the Tvertsa and Mologa; 17% of the rivers are available for steam navigation, and boats and rafts can be floated on many of the others. The Vyshni-Volochok system of canals connects the Volga with the Baltic and the Tikhvin system connects the Mologa with Lake Ladoga. Railways are comparatively good and the region is thus well situated for trade.

TVER (now KALININ), chief town of Tver region, on both banks of the Volga, at its confluence with the Tvertsa in 56° 52′ N., 35° 48′ E. The low right bank is protected from inundations by a dam. The town grew rapidly in the 20th century; pop. (1900) 45,644; (1939) 216,131. Its situation on the Moscow-Leningrad railway and on the navigable Volga has given it great trading importance as a centre for a productive region. Its chief manufactures are machinery, textiles and leather goods.

A fort was erected in 1180 at the mouth of the Tvertsa to protect the Suzdal principality against Novgorod. In the 13th century it became the capital of an independent principality, and remained so until the end of the 15th century. It long remained an open question whether Moscow or Tver would ultimately gain the supremacy in Great Russia. In 1486, when the city was almost entirely burned down by the Muscovites, the son of Ivan III became prince of Tver; the final annexation to Moscow followed four years later. In 1570 Tver had to endure, for some reason now difficult to understand, the vengeance of Ivan the Terrible, who ordered the massacre of 90,000 inhabitants of the principality. The town and region were renamed Kalinin in honour of **M. I. Kalinin,** president of the U.S.S.R.

TWAIN, MARK, the pen-name of SAMUEL LANGHORNE CLEMENS (1835–1910), American novelist and humorist, born at Florida (Mo.), Nov. 30, 1835. His father, a happy-go-lucky storekeeper and lawyer from Tennessee, popularly known as "Judge" Clemens, moved when the boy was four years old to Hannibal (Mo), dying eight years later and leaving the family all but destitute. Little Sam had virtually no formal education, but his imagination was early stored with the lore of the Mississippi river and the negroes who peopled the neighbourhood. As his brother's assistant on the Hannibal *Journal* he learned type-setting and became a journeyman printer, travelling as far eastward as New York and Philadelphia before he was 19. Drawn back to the Mississippi by the "permanent ambition" of his boyhood to become a pilot, he set to work "learning the river," getting "personally and familiarly acquainted," as he says in *Life on the Mississippi*, "with all the different types of human nature that are to be found in fiction, biography or history." At the beginning of the Civil War in 1861, the river trade came to an end, and young Clemens soon set out for the West with his brother Orion, who had just been appointed lieutenant governor of Nevada. There, in the neighbourhood of Carson City, he had a most hilarious but equally unlucrative experience as a gold miner, the record of which he has left in *Roughing It*. Soon he turned to journalism on the Virginia City *Enterprise*, adopting the *nom de plume* "Mark Twain," a call used by Mississippi pilots in taking soundings on the river. Moving to San Francisco, he became a member of the witty group that gathered about the *Golden Era* and included Artemus Ward, Charles Warren Stoddard, Bret Harte and Orpheus C. Ker, and with the publication of *The Celebrated Jumping Frog of Calaveras County* found himself famous overnight. On the wave of this notoriety he went to New York, where he delivered his "serio-humorous" lecture on the Sandwich Islands. In June, 1867, on a commission to contribute letters to the San Francisco *Alta California*, he joined the party embarking on the steamship "Quaker City" for the tour of the Mediterranean described in *The Innocents Abroad*. With the wide publication of these letters, Mark Twain became the most extensively read author in America. In 1870, he married Olivia L. Langdon and moved to Hartford, which became his home for the next 30 years.

He settled down at once to the trade of authorship, publishing *Roughing It* in 1872, collaborating in 1874 with Charles Dudley Warner in *The Gilded Age*, his sole novel of contemporary manners which contained the famous character portrait, Colonel Sellers, and writing *The Adventures of Tom Sawyer* (1875). In 1880 he visited Europe a second time, recording his experiences humorously in *A Tramp Abroad*. In 1882 he published his romance for children, *The Prince and the Pauper*, which was followed in successive years by *Life on the Mississippi* and his masterpiece, *The Adventures of Huckleberry Finn*, a sequel to *Tom Sawyer*. He became a partner of Charles L. Webster and Company which reaped immense profits from the *Memoirs of General Grant*, the *Life of Pope Leo XIII.*, but this firm failed and left him with heavy debts. Meanwhile he had published *A Con-*

necticut Yankee at King Arthur's Court (1889) and *The American Claimant* (1892), which were followed in 1894 by *The Tragedy of Pudd'nhead Wilson*, a story set in the Mississippi valley and containing much of the cynical philosophy that had become characteristic of its author

In 1891 Clemens went abroad again, and, after spending a winter in Berlin, settled in Florence, where he wrote his *Personal Recollections of Joan of Arc*, a book for which, as he later declared, he had spent 14 years in preparation, and which he published anonymously, observing to his wife that it meant more to him than anything he had ever undertaken, and that it would never be accepted seriously over his own signature. After spending two years at home, he set out, with the purpose of earning money to pay off his debts, on the journey round the world recorded in *Following the Equator*, lecturing on the way in Australia and India. Returning home in 1900, he settled in New York, and during this year a collected edition of his works in 22 volumes was issued by the American Publishing Company of Hartford He had published in 1897 a volume of miscellaneous essays entitled *How to Tell a Story;* and his further works included *The Man that Corrupted Hadleyburg* (1900), *The Double-Barrelled Detective Story* (1902), *Adam's Diary* (1904), *What is Man?* (privately printed, 1906), *Christian Science* (1907), *Captain Stormfield's Visit to Heaven* (1907) and *Is Shakespeare Dead?* (1909)

By the beginning of the last decade of his life Mark Twain had become a world celebrity and undoubtedly the most conspicuous and picturesque figure in America. In the year 1902 he made his spectacular return to the home of his childhood in Missouri, and in 1907, after having received honorary degrees from Yale and the university of his native state, he went to England to receive the degree of Doctor of Literature at Oxford In 1906 he had built a country-house, "Stormfield," at Redding (Conn), which became his home during the remaining years of his life, and there, shortly before he died, his daughter Clara, the only one of his four children who survived him, was married to the pianist Ossip Gabrilowitsch. His posthumous works comprise *The Mysterious Stranger* (1916), *What is Man? and Other Essays* (1917), *Mark Twain's Speeches* (1923), and two volumes of *Autobiography* (1924).

Mark Twain will always undoubtedly be regarded as the most characteristic American writer of his epoch. The first to represent the transition of the literary hegemony of the country from New England to the West, he was typical of the new democracy in his contempt for authority and for the sublimities as well as the commonplaces of 19th-century culture He was most widely popular in his own day as a humorist, but he will survive rather as the master folk-writer of the pioneering epoch who has left in *Roughing It* and *Life on the Mississippi* unrivalled pictures of the character and manners of the Middle and Far West in Civil War days, and in *Tom Sawyer* and *Huckleberry Finn* a veritable epic of that primitive civilization, poetic in feeling, strictly veracious in detail, abounding in colour, and, in the latter book especially, with a grasp of life that can only be described as classical

The standard biography of Mark Twain is by Albert Bigelow Paine (in three volumes, 1912). (V. W. B.)

TWAY-BLADE (*Listera*), a genus of small plants of the orchid family (Orchidaceae). The flower is green, with a downwardly directed, forked labellum Two species, the common tway-blade (*L. ovata*) and the heart-leaved tway-blade (*L. cordata*), are found in the British Isles, the last named occurring also in North America, where three other tway-blades are also native,—the broad-lipped (*L. convallarioides*), the southern (*L. australis*) and the western (*L. caurina*). For fertilization mechanism *see* C. Darwin, *Fertilization of Orchids*.

TWEED, WILLIAM MARCY ("Boss"), American politician and leader of the "Tweed Ring," was born in New York City Apr. 3, 1823. In 1852 he was elected an alderman of the New York City council. From 1854 to 1856 he served as U.S. Representative in Washington. His real power in municipal politics began in 1857 with his election to the board of supervisors, which he came to dominate. By working the downfall of Fernando Wood, a notoriously corrupt mayor, Tweed came into power under a cloak of respectability He fortified himself through his political appointments. From 1858 to 1871, while holding successively the positions of school commissioner, deputy street commissioner, State Senator and deputy commissioner of public works, Tweed, except for brief intervals, controlled the city administration In 1868 he also controlled the State Democratic Assembly at Albany, and in 1869, though he lost the Assembly, he secured the election of his nominee as governor The "Tweed Ring" of history, composed of Tweed, Mayor A. Oakey Hall, Peter B. Sweeny and Richard B Connolly, began its operations in Jan 1869 and lasted until Tweed's downfall in 1871. Conservative estimates place the amount stolen directly from the city during this period at $45,000,000, though including taxes lost through arbitrary reductions by the "ring" for money or favor and the issuance of bonds at extravagant rates of interest some authorities have estimated as high as $200,000,000. Exposure came through a book-keeper who placed evidence in the hands of the New York *Times* where it was printed. Tweed was tried, found guilty and sentenced to 12 years in the penitentiary In 1875 he escaped from the Ludlow Street gaol where he was confined, fled to Cuba and thence to Spain, where he was arrested by the Spanish Government and returned to the United States. He was again imprisoned in Ludlow Street gaol where he died Apr 12, 1878.

See D. Lynch, *"Boss" Tweed* (1927)

TWEED, a river in the south of Scotland. It rises in the south-west corner of Peeblesshire, in the hill country in which the Clyde and Annan also rise. The stream flowing from Tweed's Well, about 1,500 ft above the sea, is generally regarded as its source. For the first 36 m of its course the stream intersects the shire of Peebles in a north-easterly direction, and then, bending towards the south-east, passes Innerleithen, where it receives the Leithen (left) and the Quair (right). It then crosses Selkirkshire and, having received the Ettrick on the right, flows northward past Abbotsford, forming for about 2 m the boundary between the counties of Selkirk and Roxburgh After receiving the Gala on the left, the Tweed crosses the north-western corner of Roxburghshire past Melrose and, after being joined by the Leader on the left, winds past Dryburgh abbey round the south-western corner of Berwickshire The remainder of its course is in a north-easterly direction through Roxburghshire past Kelso, where it receives the Teviot on the right, and then between the counties of Berwick and Northumberland, past Coldstream, to the town of Berwick, where it enters the North sea. The last 2 m. of its course before reaching Berwick are in England

The Tweed is 97 m. long and drains an area of 1870 square miles Its bed is pebbly and sandy, and notwithstanding discolorations from manufactures, the stream, owing to its clear and sparkling appearance, still merits the epithet of the "silver Tweed "

TWEED, a term of very general application in the woollen and worsted trades. It is employed as a trade description for a very large variety of woollen and worsted fabrics that embody the same general textural features, but which differ in the minor details of their manufacture, construction and finish. They are described as "Scottish," "Harris," "Cheviot," "Irish," "Yorkshire," "Saxony" and "West of England" tweeds, according to the particular locality of their origin, the yarn used in their construction, their character of structure, texture, finish and other details

The description of this particular variety of worsted fabrics as "Tweeds" is commonly, but erroneously, associated with the Scottish river of that name The origin of the word "tweed" however, has no reference to the river Tweed, but is said to be due to an error on the part of a London clerk who, in the year 1826, when writing out an invoice for these goods, inadvertently wrote the word "tweeds" instead of "tweels," the Scottish for "twills " Orders were placed for more "Scottish tweeds"—a novel description which immediately won the popular favour and became firmly established in the clothing trade as a brand of quality.

The chief characteristic feature of the true type of "tweed" fabrics in general is, as the name suggests, their construction on a twill weave basis, although they are not restricted entirely to the simple regular twill weave structures, as many tweed fabrics are

based on the numerous modifications of those weaves Tweed fabrics are produced from Scottish, Cheviot, Saxony and many other types of worsted and woollen yarns of various counts and quality, and woven in solid colours, mingled "heather" tones, and coloured stripes and checks in endless variety of pattern and colour, and in every variety of texture suitable both for men's and women's clothing for outer wear, and for every season of the year.

"Herringbone" twills, "diamonds," "chevrons," "cross-twills" and "basket" weaves are popular styles for tweed designs, which are now more of a broken character than formerly, while more intricate patterns are introduced in textures of superior quality A new vogue of recent origin consists of printed tweed effects with the pattern printed on both sides of the fabric to give the impression of woven designs These printed tweeds are executed with such realistic effect that it is in some cases very difficult without close inspection to distinguish the printed imitation tweed effect from the genuine woven tweed patterns (H. N)

TWEEDDALE, JOHN HAY, 2ND EARL and 1ST MARQUESS OF (1626–1697), was son of John, 8th Lord Hay of Yester (*c* 1599–1654), created earl of Tweeddale in 1646 Before succeeding to the peerage in 1654 the second earl fought for Charles I during the Civil War, but he was in the Scottish ranks at Marston Moor. Changing sides again, he was with the royalists at Preston; but he was a member of Cromwell's parliament in 1656, and was imprisoned just after the restoration of Charles II. He was soon, however, in the king's favour, and in 1663 was appointed president of the Scottish council, and in 1664 an extraordinary lord of session. In Scotland he sought to mitigate the harshness shown by the English government to the Covenanters, and for this attitude he was dismissed from his offices in 1674; but he regained an official position in 1680 and held it during the reign of James II. A supporter of William of Orange, he was made lord high chancellor of Scotland in 1692, and two years later was created marquess of Tweeddale and earl of Gifford He favoured the scheme for the expedition to Darien, and as lord high commissioner during William's absence he formally assented to the act establishing the trading company in 1695; for this action he was dismissed from office when the king returned to England in 1696. He died on Aug. 11, 1697.

TWEEDSMUIR, 1ST BARON *see* BUCHAN, JOHN.

TWELVE TABLES, the tables of wood on which was engraved or painted the earliest codification of the Roman law Originally ten in number, two supplementary tables were added, and the whole code was termed the *Lex XII Tabularum* (Law of the Twelve Tables). (*See* ROMAN LAW and ROME)

TWENTY-FOUR PARGANAS, THE, a former district of British India, in the Presidency division of Bengal; area 3,696 sq.mi. Pop. (1941) 3,536,386. It occupied part of the Gangetic delta, east of the Hooghly, surrounding (but not including) the city of Calcutta. It also included the greater part of the almost uninhabited Sundarbans (*q v*), so that within its confines were found virgin forest, settled tilth and the busy life of the suburb of a great city. The administrative headquarters were at Alipur, a southern suburb of Calcutta. The country consists for the most part of an alluvial plain with a population devoted to agriculture and almost entirely rural, but a chain of industrial towns stretches along the bank of the Hooghly from Garden Reach northward. Rice is the staple crop, followed by jute, pulses and sugar cane. The riparian strip is crowded with towns, factories and mills; Bhatpara has 117,044 and Titagarh 57,416 inhabitants. Other industrial towns are Baranagar (54,451), Budge-Budge, Naihati, Kamarhati, South Dum-Dum and Kanchrapara, in the last of which are the works of the broad gauge system of the Eastern Bengal State railway. In other towns various manufactures are to be found, principally jute mills and jute presses, and also, at Dum-Dum, government factories for rifles

TWICKENHAM, a municipal borough mainly in the Twickenham parliamentary division of Middlesex, England, 12 mi. W.S.W. of St Paul's cathedral, London, on the river Thames, and with three stations on the Southern Region railway. Pop. (1938) 96,550 Area, 10.96 sq mi. It grew into an extensive residential district. The church of St. Mary has a Perpendicular tower. Among men of eminence buried here are Alexander Pope and Sir Godfrey Kneller The Thames in this neighbourhood forms a long deep reach in favour with fishermen, and Eel Pie Island is a resort of boating parties There are many fine houses in the vicinity, several possessing historical associations Strawberry Hill, the residence of Horace Walpole, was built to his taste in a medley of Gothic styles. Marble Hill was erected by George II for the countess of Suffolk, and Pope, Swift and Gay took part in its equipment. Orleans House was the residence in 1800 of Louis Philippe, then duke of Orleans, and this family again acquired it in 1852, when it was occupied by the duke of Aumale. York House was given to Lord Clarendon by Charles II, was probably the occasional residence of James II when duke of York, and in 1864 was occupied by the comte de Paris

Twickenham at the Domesday survey was included in Isleworth. Anciently it was called Twittenham or Twicanham, and the first form, or a variation of it, is used by both Pope and Walpole. The manor was early in the hands of the monks of Christ church, Canterbury, but in the reign of Henry VIII it came into the possession of the crown, and by Charles I was assigned to Henrietta Maria as part of her jointure In 1670 it was settled for life on Catherine of Braganza, queen of Charles II It remains in possession of the crown, but after the death of Catherine was let on leases The old manor house, now demolished, was Catherine's residence. It had been, according to tradition, the place of the retirement of Catherine of Aragon after her divorce from Henry VIII Twickenham was incorporated in 1926, and in 1937 the urban districts of Hampton, Hampton Wick and Teddington were added to the borough, which contains more than 2,000 ac. of open public spaces, including Hampton Court palace, the Home park and Bushey park.

TWILIGHT, the interval during which the atmosphere is illuminated after sunset; formerly known as *crepusculum*, Lat. for dusky or obscure. The analogous early morning phenomenon is known as the dawn (*q.v.*). These phenomena are caused by the intervention of the atmosphere between the sun and the earth's surface. An entire absence of atmosphere would cause darkness to set in sharply at sunset as on the moon; but under present conditions even when the sun is some distance below the horizon the upper layers of air are illuminated and are reflecting light. Even as early as the 11th century the duration of twilight was determined as ending when the sun had "travelled" 18° below the horizon and subsequent observations have not materially modified the figure.

This quantity, 18°, has been made the measure for the interval between sunset or sunrise and "complete" darkness, and is termed astronomical twilight; but during a large part of this interval the light is insufficient for ordinary employments, consequently a shorter period, civil twilight, is also recognized for which the quantity is about 6°, but it is conditioned by the amount of light still available.

The duration in each case is dependent on the latitude of the observer and the season of the year. The intensity of illumination depends to a considerable extent on the amount of atmospheric cloud and dust. Twilight after the sunsets of 1883–85 was frequently intense because of the reflection from the extra dust in the higher layers of the atmosphere as a result of the eruption of Krakatoa.

TWILIGHT SLEEP: *see* SCOPOLAMINE.

TWILL, a woven cloth in which the passage of the weft is arranged, not in regular succession as in plain weaving, but over one thread and under two or more according to the kind of twill This gives a succession of diagonal lines to the cloth, and though in the normal type of twill this diagonal traverses from selvage to selvage at an angle of 45°, considerable variations may be made.

TWIN FALLS, a city of southern Idaho, U.S.A., on the Snake river plateau, 40 mi from the Nevada state line; the county seat of Twin Falls county. It is on federal highways 30 and 93 and the Oregon short line of the Union Pacific railway system. Pop. (1950) 17,544 It is a trading and shipping point for a fertile irrigated region (706,000 ac. within 50 mi.), producing chiefly

livestock, dairy and agricultural products It has large wholesale and commission houses, bonded warehouses, several farmers' co-operative associations, flour mills, creameries, a fruit dehydrating plant and other manufacturing industries, converting farm products into less bulky form. There are many points of interest in the vicinity Shoshone falls (212 ft.) are 6 mi from Twin Falls The black lava canyon of the Snake river is spanned 2½ mi. N. of the city, by a bridge 476 ft above the water and 1,400 ft. long. The falls from which the city and county take their name are divided into two parts by a huge mass of black lava.

TWINS AND TWINNING. Human twins are of two kinds one-egg and two-egg twins. One-egg twins are variously known as identical, uniovular or monozygotic; two-egg twins, as fraternal, biovular or dizygotic. Most mammals regularly bear several young to a litter, each young derived from a separate egg Some of the larger mammals, however, habitually bear only one young at a time (as in the case of man, cattle, horses), but sometimes bear small litters of two, three or more. When such uniparous species bear plural young, the latter are known as plural-egg twins, triplets, etc. Some mammals, however, such as the nine-banded armadillo (*Dasypus novemcinctus*) and related South American species, have been shown to give rise to multiple offspring in an entirely different manner. A single early embryo divides and subdivides into four parts, which severally develop into four distinct offspring—one-egg quadruplets In addition to two-egg twins, the human race produces considerable numbers of one-egg twins, triplets, etc., in a manner probably similar to that known for the armadillos.

Supertwins.—Both one-egg and plural-egg twinning in man go beyond mere twinning proper to produce triplets, quadruplets, quintuplets and sextuplets (the highest number known to occur). Two, three, four or five offspring from a single egg are known (the Dionne quintuplets being surely monozygotic). Plural-egg triplets may come from two or three eggs; quadruplets from two, three or four eggs; and quintuplets from two, three, four or five eggs.

Frequencies of Twins, Triplets, etc.—In the United States, which has a mixed population of almost all races, one out of 44 babies born is a twin. For every 86 single births there is one twin birth, making a percentage of twin births of 1.15. Twin frequencies differ greatly among different races and countries, being highest among north Europeans and lowest among various Mongoloid peoples. Among countries keeping reliable vital statistics, Belgium claims 1.79% of twin births, Finland, 1.65%; while Japan has only 0.69%, due largely to relatively few two-egg twins. One-egg twins seem to have about the same incidence the world over. Triplets are about 86 times as rare as twins, and quadruplets about 86 times as rare as triplets. If then we speak of the frequency of twin births to singles as one to 86, that of triplets is about one in 86^2 and that of quadruplets about one to 86^3, a curious but unexplained set of ratios.

Diagnosis of One-egg Twins.—Two methods of distinguishing one-egg from two-egg twins are used: the foetal membrane method and the similarity method. According to the membrane method, one-egg twins should always be enclosed in a common birth robe (chorion) and two-egg twins in separate chorions, but some one-egg twins have separate chorions. Hence the membrane method is somewhat unreliable. According to the similarity method, twins that are so similar as to be easily confused are classed as one-egg twins and those that differ markedly, as two-egg twins. The few doubtful cases are resolved by meticulous comparisons of such details as blood groups, eye colour and finger-prints. In the hands of experts, few mistakes are likely to be made.

Hazards of Twinning.—The human species is highly specialized for single-offspring births, and plural-offspring births are less viable. The prenatal and infantile mortality rate of twins probably averages about 50%, or about five times that of singles Also, more than half of all twins are born prematurely and are thus more likely to be injured at birth. All of these hazards increase progressively for triplets, quadruplets and quintuplets.

Sex Distribution.—Twins are more frequently of like than of unlike sex. Extensive counts covering more than 700,000 cases show that twins are of unlike sex in only about three-eighths of them From such counts an estimate can be made of the frequency of one-egg twins, for these are never of unlike sex, while of the two-egg twins half are expected to be so Since, in fact, three-eighths are of unlike sex, it may be inferred that twice this number, or three-fourths, must be two-egg twins, and hence one-fourth, or the remainder, must be one-egg twins.

Joined-together Twins.—Occasionally twins are joined at birth, as in the famous Siamese twins. In most cases they are joined symmetrically, like part with like. Superficial unions are easily severed at birth. More deeply united pairs seldom survive, though a few have lived to become natural curiosities. Most joined twins exhibit abnormal disposition of blood vessels and viscera, known as *situs inversus*, in which the organs of one twin are more or less completely a mirror image of those of the other A few cases of separate one-egg twins show the same peculiarity. Joined twins are always same-sexed, and much evidence points to the conclusion that one-egg twins always result when the twinning division of the originally single embryo has been incomplete.

Heredity of Twinning.—The tendency to bear twins is regarded as slightly hereditary, though its exact mode and pattern of inheritance is far from clear. That relatives of twins have twins somewhat more frequently than the general population has been claimed by many writers, though satisfactory records are rare According to some investigators, the production of two-egg twins seems to be influenced only by the mother and depends greatly upon her age, for the frequency of twins increases at least three-fold from the age of 18 to that of 38. It is generally agreed that the tendency to bear two-egg twins is somehow hereditary, but opinions vary widely as to one-egg twinning. Some writers hold that the frequency of one-egg twinning depends on the inheritance of the father as well as that of the mother, but is uninfluenced by age or environmental factors. Others regard one-egg twinning as probably nonhereditary and due to an early arrest of development that disturbs the unity of the embryo and favours the development of two or more growth centres (organizers), each of which grows into a separate individual.

Twins and Human Genetics.—Twins have been extensively used in attempts to estimate the relative shares of hereditary and environmental factors in determining differences in physical, mental and temperamental traits. In character differences determined wholly by heredity, one-egg twins should be exactly alike, whereas two-egg twins should show degrees of resemblance no greater than brothers and sisters by different births. Most human differences, however, are determined partly by heredity and partly by environment. With respect to each trait we wish to know what relative shares hereditary and environmental factors have in determining differences. A comparison of large numbers of one-egg twin pairs reared together with an equal number of two-egg pairs reared together should give for each trait the percentage share of hereditary determination, for the two groups differ only with respect to heredity, the one-egg pairs being alike and the two-egg pairs different. A second comparison has been made between 50 pairs of one-egg twins reared together and 20 pairs of one-egg twins (all that could be found) reared apart under various degrees of environmental differences. This comparison should give us the effects of environmental differences, for the two groups are alike as far as heredity is concerned. From both comparisons it was evident that physical traits are least affected by environmental differences; that mental ability is affected more; educational achievement, still more; and personality or temperament, the most.

6 Quadruplet daughters. In this case the father was one of 12 children, among whom was one pair of twins. There was no record of twins on the mother's side. If the explanation for the appearance of the quadruplets be sought in heredity, it is attributable most probably to the father rather than to the mother

sity college, Oxford, of which he was afterward successively bursar, dean and tutor. He published while at Oxford an epitome of Barthold Niebuhr's *History of Rome*, an annotated edition of Livy and other works, but his studies were mainly in political economy, international law, and international politics. In 1840 he was called to the bar, and became an advocate at Doctor's commons. In the ecclesiastical courts he enjoyed a large practice and filled many appointments such as commissary general of the city and diocese of Canterbury (1849), vicar general to the archbishop (1852) and chancellor of the diocese of London (1858). He was professor of international law at King's college, London (1852–55). His successful career continued in the civil courts, and in addition to his practice he was appointed in 1862 advocate general to the admiralty, and in 1867 queen's advocate general. He was knighted in 1867. His reputation abroad led to his being invited by the king of the Belgians in 1884 to draw up the constitution of the Congo Free State. Twiss lived in retirement in London after 1871 when he was involved in an unpleasant scandal. He died on Jan. 14, 1897. Among his important publications of this period were *The Law of Nations in Peace* and *The Law of Nations in War*.

TWO-NAME PAPER: *see* DOUBLE-NAME PAPER.

TWO RIVERS, a town in eastern Wisconsin, U S, in Manitowoc county. It is situated 85 mi. north of Milwaukee, on Lake Michigan at the point where the Neshoto and Mishicot rivers join to flow into the lake through a single channel The town is served by the Chicago and North Western railroad.

The altitude is 597 ft; the population was 10,243 in 1950, 10,302 in 1940 and 10,083 in 1930 by the federal census.

Manufactures include aluminum products, furniture, electrical toys and appliances, engines, castings, chemicals, yarn and knit goods, agricultural equipment and tile.

The town is in the centre of a diversified agricultural area, and dairying is important.

Two Rivers was first settled by fishermen who began commercial fishing there in 1836; the town was also a busy lake port until the 1870s Lumbering was an important activity of the early settlers and shipbuilding was an important industry between 1850 and 1875.

TWO-STEP, a modern round dance in which the partners perform a series of sliding steps in $\frac{2}{4}$ time. The first step of each measure, or the slide, is longer than the second.

(*See* also DANCE.)

TWYSDEN, SIR ROGER (1597–1672), English antiquary and royalist pamphleteer, was educated at St Paul's school, London, and then at Emmanuel college, Cambridge He entered Gray's Inn on Feb. 2, 1623. He succeeded to the baronetcy on his father's death in 1629. For some years he remained on his estate at Roydon, East Peckham, largely engaged in building and planting, but also in studying antiquities and the law of the Constitution.

Twysden took the most prominent part in preparing the Kentish petition of March 1642 and in subsequent demonstrations on behalf of Charles. He incurred the wrath of the parliament, was arrested on April 1, 1642, but was soon let out on bail, and on his promise to keep quiet. But his respect for legality would not let him rest, and he was repeatedly in trouble with the parliament until 1650, when he compounded and went home. He lived quietly there till the Restoration, when he resumed his position as magistrate. He died on June 27, 1672.

Twysden published *The Commons' Liberty* (1648), demonstrating that finings and imprisonings by parliament were illegal; *Historiae anglicanae scriptores decem* (1652), a work encouraged by Cromwell; and *Historical Vindication of the Church of England* (1657).

TYBURN, a left-bank tributary of the Thames, England, now having its course entirely within London and below ground. The name, which also occurs as Aye-bourne, is of obscure derivation, though sometimes stated to signify Twy-burn, *i.e.* (the junction of) two burns or streams. The Tyburn rose on the southern slope of the Hampstead heights in two streams, the more westerly of which rose in the spring known as the Shepherd's Well. It ran south, crossing Regent's Park, its course being marked by Regent's Park Water, and further south by the windings of Marylebone Lane and the dip in Piccadilly near the junction of Half Moon street. It then crossed the Green Park and entered the flood plain of the Thames near where Buckingham palace now stands. The exact point at which it entered the Thames is doubtful but its water is now drained off by sewer. After 1238 it supplied the city with water for a long time by means of nine conduits. The name is more famous in its application to the Middlesex gallows also called Tyburn Tree and Deadly Never Green, and also at an early period, the Elms, through confusion with the place of execution of that name at Smithfield.

The Tyburn gallows stood not far from the modern Marble arch. Connaught square is said by several authorities to have been the exact site, but it appears that so long as the gallows was a permanent structure it stood at the junction of the present Edgware and Bayswater roads. The site, however, may have varied, for Tyburn was a place of execution as early as the end of the 12th century. In 1759, moreover, a movable gallows superseded the permanent erection. On some occasions its two uprights and cross-beam are said to have actually spanned Edgware road. Round the gibbet were erected open galleries, the seats in which were let at high prices. Among those executed here were Perkin Warbeck (1499), the Holy Maid of Kent and confederates (1535), Haughton, last prior to the Charterhouse (1535), John Felton, murderer of Villiers, duke of Buckingham (1628), Jack Sheppard (1724), Earl Ferrers (1760).

In 1661 the skeletons of Cromwell, Ireton and other regicides were hung upon the gallows. The last execution took place in 1783, the scene being thereafter transferred to Newgate. The Tyburn Ticket was a certificate given to a prosecutor of a felon on conviction, the first assignee of which was exempted by a statute of William III from all parish and ward duties.

See A. Marks, *Tyburn Tree, its History and Annals* (London, 1908).

TYDEUS, in Greek legend, son of Oeneus, king of Calydon, and Periboea. Having slain his uncle (or other relatives) he fled for refuge to Argos, where Adrastus purified him and married him to his daughter Deipyle, who became the mother of Diomedes (*q v*). In the expedition of the Seven (*cf* OEDIPUS), Tydeus, who had fought valiantly, was mortally wounded by Melanippus. Having killed Melanippus, he proceeded to devour his head; this so disgusted Athena, who had meant to make him immortal, that she left him to die.

See Roscher's *Lexikon*, art. "Tydeus"

TYLDESLEY, an urban district of Lancashire, England, 10 mi. W.N.W. from Manchester. Pop. (1951) 18,096. Area, 8 1 sq. mi. The town, of modern growth, depends on cotton mills and collieries. The council maintains a library and technical school.

TYLER, JOHN (1790–1862), tenth President of the United States, was born at Greenway, Charles City county, Virginia, on March 29, 1790. He was the second son of John Tyler (1747–1813), of English descent, governor of Virginia in 1808–11 and U.S. district judge in 1812–13. John Tyler the younger entered the grammar school of the College of William and Mary, at Williamsburg, in 1802, and graduated at the college in 1807. Two years later he was admitted to the bar. His public life began in 1811, when he was elected a member of the Virginia house of delegates. Here he served for five years, being chosen also in 1815 a member of the council of State. In 1813 he raised a company for the defence of Richmond against the British, but his command was not called into action and his military service was concluded after a month. From Dec. 1816 to March 1821 he was a member of the National House of Representatives. Believing firmly in the republican principles of Jeffersonian democracy, he opposed the demand for internal improvements and increased tariff duties. He declined to follow Henry Clay in the proposed recognition of the independence of the Spanish colonies in South America and in the Missouri Compromise legislation, and he condemned Jackson for his execution of Arbuthnot and Ambrister in Florida. He declined re-election to the House in 1821 because of ill-health. In 1823–25 he was again a member of the Virginia house of delegates, and in 1825–27 was governor of the State. In 1827 he was sent

to the U S. senate to succeed John Randolph, after having been unanimously re-elected governor In 1829–30 he also served as a member of the Virginia Constitutional Convention. His career as senator was marked by great independence of party, for his political ideas continued to be those of a thoroughgoing "strict-constructionist." Believing protective tariff duties to be unconstitutional, he voted against the "tariff of abominations" in 1828, and also against the tariff of 1832; but the compromise tariff of 1833, made necessary by the hostile attitude of South Carolina, owed its inception largely to him. His hostility to a high tariff policy, however, did not prevent his condemning the South Carolina ordinance of nullification; and in the presidential election of 1832 he supported Andrew Jackson, to whose political principles and methods he was invincibly opposed, as the "least objectionable" of the various candidates. His opinions never changed, though he aligned himself with parties as they developed In this way he became a Whig (1833), but agreed with the Democrats on state's rights and differed from them on nationalism He sought to incorporate in a new code for the District of Columbia, in 1832, a prohibition of the slave trade in the district, at the same time opposing the abolition of slavery there without the consent of Maryland and Virginia, which had originally ceded the district to the United States In the controversy over the removal of the government deposits from the Bank of the United States he sided with the bank In 1833 he was again elected to the senate, notwithstanding the criticism of his independent attitude and the wide approval of Jackson's policy in regard to the bank. In the election of 1836 he was supported as a candidate for the vice-presidency by the friends of H. L White of Tennessee, the Democratic candidate opposed to M. Van Buren, and received 47 votes, none of them from Virginia When the legislature of Virginia instructed its senators to support Benton's expunging resolution, Tyler, admitting the right of instruction, could not conscientiously obey, and on Feb. 29, 1836, he resigned his seat. In 1838 he became once more a member of the Virginia house of delegates, and was chosen president of the Virginia colonization society, of which he had long been a vice-president. In 1839 he made an unsuccessful contest for the U S. senatorship. In December of that year the Whigs nominated W. H. Harrison for president and Tyler for vice-president without issuing a platform Tyler was nominated with the expectation that he would carry the south, and in the belief that his senatorial record was a declaration of principle Harrison and Tyler each received 234 electoral votes and were elected On April 4, 1841, one month after the inauguration, Harrison died, and Tyler became president. The detailed discussion of the events of his administration, 1841–45, belongs to the history of the United States (*see* UNITED STATES *History*).

He kept Harrison's cabinet until his veto of the bill for a "fiscal corporation," as being opposed to state's rights, led to the resignation of all the members except D Webster, who was bringing to a close the negotiations with Lord Ashburton for the settlement of the northeastern boundary dispute Tyler opposed the recognition of the spoils system and kept at their posts some of the ablest of the ministers abroad He stood, however, between the two great parties, without the support of either, Van Buren refused to recognize him as a Democrat, and the Whigs repudiated him, while, with Clay leading the majority in congress, harmony between that body and the executive was from the first impossible The annexation of Texas, achieved just before the close of his administration, seemed to commend him for a second term, and in May 1844 he was renominated by a convention of Democrats, irregularly chosen, at Baltimore The majority of the annexationists, however, would not support him, and he had further to meet the opposition of Van Buren, who had failed to secure the nomination in the regular Democratic convention, and of J. K. Polk, the regular Democratic nominee. Tyler accepted the Baltimore nomination, but on Aug 20 withdrew from the contest. From this time until the eve of the Civil War he held no public office, but his opinions on political questions continued to be sought, and he was much in demand as a speaker on public occasions. In Dec 1860 when South Carolina adopted its ordinance of secession, Tyler, though sympathizing with the state, took firm ground against disunion and exerted himself on behalf of peace. The legislature of Virginia appointed him a commissioner to confer with President Buchanan and arrange, if possible, for the maintenance of the *status quo* in the matter of Ft Sumter, in Charleston harbour; but his efforts were unavailing. He was largely responsible for, and presided over, the peace congress which assembled at Washington on Feb 4, 1861, pursuant to a resolution of the Virginia legislature. The constitutional amendment proposed by the conference did not meet with his approbation, and his action in signing and transmitting the resolution to congress was merely formal. On Feb 13, while in Washington on this mission, he was elected to the Virginia convention at Richmond, and took his seat on March 1. In the convention he advocated immediate secession as the only proper course under the circumstances He continued to serve as a member of the convention until it adjourned in December, in the meantime acting as one of the commissioners to negotiate a temporary union between Virginia and the Confederate States of America He was a member of the provisional Confederate congress in 1861 and was elected a member of the house of representatives of the permanent congress, but died on Jan 18, 1862, in Richmond, before that body assembled

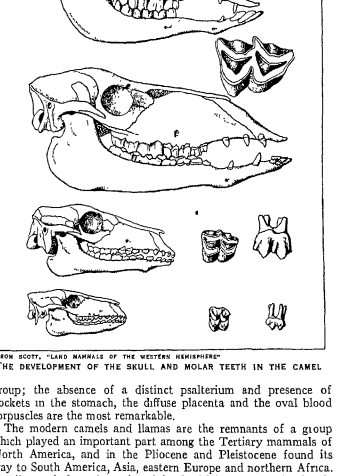
Tyler was twice married; first in 1813 to Letitia Christian (1790–1842), and then in 1844 to Julia Gardiner (1820–89).

His son, LYON GARDINER TYLER (1853–1935), graduated at the University of Virginia in 1875 and practised law at Richmond, Va., from 1882 to 1888, when he became president of the College of William and Mary Among his publications, besides *Letters and Times of the Tylers*, are *Parties and Patronage in the United States* (1890); *Cradle of the Republic* (1900); *England in America* (1904–06), in the "American Nation" series and *Williamsburg, the Old Colonial Capital* (1908). He died Feb. 12, 1935.

The principal authority is Lyon G. Tyler, *Letters and Times of the Tylers*, Richmond, Va (1884–96). A good sketch of Tyler is in *Virginia Portraits* (1924), by Armistead Gordon

TYLER, MOSES COIT (1835–1900), American historian was born in Griswold (Conn.), on Aug. 2, 1835, but his boyhood was spent in Michigan. From his graduation at Yale in 1857 until his death in Ithaca (N.Y.), on Dec. 28, 1900, he alternated between a desire for a life of service in the ministry and a life of study Although he attended the Yale and Andover theological schools, held pastorates at Owego and Poughkeepsie (1859–62), and indulged in a couple of journalistic interludes, his reputation was won through his professorships at Michigan and Cornell universities and his publications, notably his *History of American Literature during the Colonial Time, 1607–1765* (1878, rev 1897); *Literary History of the American Revolution, 1763–1783* (1897); *Three Men of Letters* (1895); and *Patrick Henry* (1887), a sound and critical biography.

See tributes by W P. Trent in the *Forum* (Aug 1901) and by J W Jenks in the *Michigan Alumnus* (March 1901). *Moses Coit Tyler· Selections from His Letters and Diaries* (1911), by Jessica T. Austen, illuminates his personality and work.



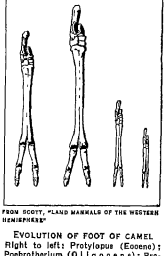
TYLER, WAT (or **WALTER**) (d. 1381), English rebel, was a native either of Kent or of Essex Nothing definite is known of him previous to the outbreak of the peasant revolt in 1381, but Froissart says he had served as a soldier in the French War. The name Tyler, or Teghler, is a trade designation and not a surname. The discontent of the rural labourers and of the poorer class of craftsmen in the towns, caused by the economic distress that followed the Black Death and the enactment of the Statute of Labourers in 1351, was brought to a head by the imposition of a poll tax in 1379 and again in 1381, and at the end of May in the latter year riots broke out at Brentwood in Essex on June 4, and at Dartford; on June 6 a mob several thousand strong seized the castle of Rochester and marched up the Medway to Maidstone. Here they chose Wat Tyler to be their leader, and the rising spread over Kent On the 10th Tyler seized Canterbury, sacked the palace of Archbishop Sudbury, the chancellor, and beheaded three citizens as "traitors" Next day he led his followers, strengthened by many Kentish recruits, on the road to London, being joined at Maidstone by John Ball

(*q.v.*), whom the mob had liberated from the archbishop's prison Reaching Blackheath on the 12th, the insurgents burnt the prisons in Southwark and pillaged the archbishop's palace at Lambeth, while another body of rebels from Essex encamped at Mile End. King Richard II was at the Tower, but neither the king's councillors nor the municipal authorities had taken any measures to cope with the rising The drawbridge of London Bridge having been lowered by treachery, Tyler and his followers crossed the Thames; and being joined by thousands of London apprentices, artisans and criminals, they sacked and burnt John of Gaunt's splendid palace of the Savoy, the official residence of the treasurer, Sir Robert Hales, and the prisons of Newgate and the Fleet On the 14th Richard II, a boy of fourteen, rode out to confer with the rebels beyond the city wall At Mile End the king met Wat Tyler; Tyler demanded the immediate abolition of serfdom and all feudal services, and the removal of all restrictions on freedom of labour and trade, as well as a general amnesty for the insurgents. Charters were immediately drawn up to give effect to these demands Meanwhile Tyler with a small band of followers returned to the Tower, and dragged forth Archbishop Sudbury and Sir Robert Hales from the chapel and murdered them on Tower Hill. During the following night and day London was given over to plunder and slaughter Meantime the people of property began to organize themselves for the restoration of order On June 15 Richard rode to Smithfield for a further conference with the rebels. Wat Tyler advanced from the ranks of the insurgents and shook the king's hand, bidding him be of good cheer Tyler then formulated a number of fresh demands, including the confiscation of ecclesiastical estates and the institution of social equality. Richard replied that the popular desire should be satisfied "saving the regalities of the Crown" Tyler thereupon grew insolent, and in the altercation that ensued was killed by the mayor, Sir William Walworth (*q.v.*), and John Standwick, one of the king's squires The enfranchisement of villeins granted by Richard at the Mile End conference was revoked by parliament in 1382, and no permanent results were obtained for the peasants by Wat Tyler's revolt.

BIBLIOGRAPHY.—The best original account of the rebellion of Wat Tyler is the "A hommalle Chronicle of St. Mary's, York," printed by G. M. Trevelyan in the *Eng. Hist. Rev.* (1898). *See* also Thomas Walsingham, *Chronicon Angliae* (Rolls series, 1874); Froissart, *Chronicles* (edited by G. C. Macaulay, London, 1895), André Réville, *Le Soulèvement des travailleurs d'Angleterre en 1381* (1898); C. Oman, *The Great Revolt of 1381* (Oxford, 1906), and *The Political History of England*, vol. iv. (ed. by W. Hunt and R. L. Poole, 1906)

TYLER, a city of N.E Texas, county seat of Smith county The population was 38,864 in 1930 and 28,279 in 1940 by the federal census The city lies between the Sabine and Neches rivers, surrounded by farmlands, many lakes and masses of forests. Pecans, peaches, berries, vegetables, corn and cotton are the leading crops. Large nurseries specialize in roses; about two-thirds of the U.S. supply of rosebushes is grown within the immediate area There are abundant supplies of natural gas and oil; the latter was discovered 30 mi. S in March 1927 The educational system includes two commercial and two Negro colleges The city has a city-manager form of government The East Texas fair is held there in September, the Texas Rose festival in October Tyler was laid out for the county seat in 1846, and was named after Pres John Tyler. It was incorporated as a town in 1870; grew rapidly when the first railway reached it in 1871, and was chartered as a city in 1907.

TYLOPODA, a suborder of the paired-hoofed mammals (*see* ARTIODACTYLA) including the Xiphodontidae and Camelidae, of which the old world camels (*see* CAMEL) and the South American llamas and their allies (*see* LLAMA) are the only living representatives. The outstanding distinctions of the Tylopoda are. (1) the retention of the lateral incisors, canines and usually the first premolars as small recurved laniary tusks, (2) reduction of the remaining premolars and narrowness of the molars; (3) the peculiar form of tympanic bulla, folded in upon itself and filled with cancellous tissue; (4) elongate cervical vertebrae and peculiar course of the vertebral artery, perforating the inner side of the pedicle of the arch instead of the transverse process as in all other mammals (except *Macrauchenia*, *q.v.*); (5) carpal and tarsal bones remain separate, the trapezoid and magnum never co-ossified, nor the cuboid and navicular, while the trapezium is reduced to a small nodule in Miocene and disappears in later genera, only the ecto- and mesocuneiform are consolidated; (6) fore and hind feet completely didactyl, the lateral pair of digits absent except for small vestigial splints or nodules in the early forms, the median pair long, slender, appressed in early stages, consolidated into a cannon-bone in all later Tertiary and modern Tylopoda; (7) the distal ends of metapodials remain separate and slightly divergent, the keels of their distal facets confined to the palmar surface and not extending over the dorsal surface as in the pecora; (8) phalanges flattened and widened in varying degree and the hoof correspondingly reduced and limited to the upper surface of the terminal phalanx, conformant with the development of a heavy cutaneous pad on the palmar surface, and a digitigrade rather than ungulgrade gait. No horns or antlers are developed The femur and humerus are relatively elongate and the thigh and upper fore-limb are more free from the flank than in other ruminants. Many features of the soft anatomy are peculiar to the



FROM SCOTT, "LAND MAMMALS OF THE WESTERN HEMISPHERE"
THE DEVELOPMENT OF THE SKULL AND MOLAR TEETH IN THE CAMEL

group; the absence of a distinct psalterium and presence of pockets in the stomach, the diffuse placenta and the oval blood corpuscles are the most remarkable.

The modern camels and llamas are the remnants of a group which played an important part among the Tertiary mammals of North America, and in the Pliocene and Pleistocene found its way to South America, Asia, eastern Europe and northern Africa. Fossil camels have been found in the Pleistocene of Alaska, in the Pliocene and Pleistocene of China, Siberia and Russia, the Pleistocene of Rumania and of Algeria, all of them related to the modern camels, but the Pliocene species from China and Russia are in a more primitive generic stage (*Paracamelus*). In South America the fossil Camelidae are related to the llama

group, the older forms of late Pliocene and early Pleistocene more primitive in dentition (*Palaeolama*)

The ancestry of the camels is shown in North America by a very complete fossil record from Oligocene to Pleistocene, with more doubtful predecessors in the Eocene The earliest stage is *Protylopus* of the Upper Eocene, about the size of a jack-rabbit It has none of the characteristics of the Tylopoda well developed but is said to show them in a rudimentary stage. *Xiphodon* and other genera from the Upper Eocene of Europe have some claim to be associated with the Tylopoda.

FROM SCOTT, "LAND MAMMALS OF THE WESTERN HEMISPHERE"

EVOLUTION OF FOOT OF CAMEL
Right to left: Protylopus (Eocene); Poabrotherium (Oligocene); Procamelus (Miocene); guanaco (living)

Poebrotherium of the American Oligocene is the first of the undoubted ancestral line of the camels It is about as large as a sheep and the long neck and limbs, peculiar course of the vertebral artery, the characteristic form of the tympanic bulla and the structure of teeth and feet are unmistakably camelid The dentition is complete, the anterior teeth are all incisiform in some species, in others the canines are small, recurved, spaced tusks. The feet are two-toed, the lateral digits reduced to nodules, the median pair elongate and appressed but not co-ossified into a cannon-bone, the distal facets like those of modern Camelidae.

Oxydactylus of the Lower Miocene has the anterior teeth small recurved tusks, the vestiges of the lateral digits have disappeared or co-ossified, the median pair is more closely appressed and the size has increased to that of a llama or larger.

In *Protolabis* of the Middle Miocene the first and second upper incisors are reduced in size, the molar crowns are higher, and the metapodials are co-ossified to a varying degree in different species and at different ages In *Procamelus* of the Upper Miocene the first and second upper incisors have disappeared, and the co-ossification of the metapodials is complete. Another side branch, *Alticamelus*, in the later Miocene and Pliocene differs from *Procamelus* in the long limbs and neck and relatively small head.

In the Pliocene follow a number of diverse genera incorrectly grouped under the name of *Pliauchenia*, and characterized by the loss of the second premolar in upper and lower jaw; but while they agree in this particular they differ widely in size, proportions, retention or loss of other teeth, height of molar crowns, etc. The best known is *Megatylopus*, probably identical with *Paracamelus* of the Chinese Pliocene, larger and more robust than the modern camel, with foot-pads less developed, but in most respects approximately ancestral. A group of smaller species, to which the name *Pliauchenia* may be found applicable, shows a similar approach to the llamas; a third group appears to be derived from *Alticamelus*, and a fourth parallels the Virginia deer in proportions (although not related).

In the Pleistocene the genus *Camelops* has lost the third lower premolar as well as $p\frac{2}{2}$, and $p\frac{2}{2}$ is much reduced; $p\frac{1}{1}$ is present or absent in different species. It is of about the size and proportions of the modern camels, but lacks the broadly flattened toes and probably had not much padding on the foot. Another genus, akin to the llamas but with longer cannon-bones, relatively smaller head and sometimes retaining $p\frac{1}{1}$, occurs in the Pleistocene of the southern and south-western United States.

It has been generally believed that the camels became extinct in North America in the older Pleistocene, but recent evidence shows that some at least survived in Nevada until almost recent times, and probably elsewhere in the south and south-west until late Pleistocene. The splitting up of the family into the camels proper and the llama group is clearly foreshadowed in the geographical distribution of the Pliocene and Pleistocene species, many of the south-western species showing more affinities to the llamas, while those of the north-west are nearer to the camels. The Alaskan species and the Chinese *Paracamelus* make a still closer approach to the camel, and the Siwalik species is a typical *Camelus*. The Rumanian "*Camelus*" *alutensis* is, however, a side branch with low-crowned molars, slender jaw and retaining $p\frac{1}{1}$, related to one of the North American Pliocene groups. In South America *Palaeolama* of the early Pleistocene, while retaining the second and third premolars like *Procamelus*, is quite a llama-like in details of molar construction, in characters and proportions of skull and skeleton.

TYLOR, SIR EDWARD BURNETT (1832–1917), English anthropologist, was born at Camberwell, London, on Oct. 2, 1832, the son of Joseph Tylor, a brassfounder. Alfred Tylor, the geologist, was an elder brother. His parents were members of the Society of Friends, at one of whose schools, at Grove House, Tottenham, he was educated. During 1855–1856 he travelled in the United States. Proceeding in 1856 to Cuba, he met Henry Christy the ethnologist. While on a visit to Cannes he wrote a record of his observations, entitled *Anahuac; or, Mexico and the Mexicans, Ancient and Modern*, which was published in 1861 In 1865 appeared *Researches into the Early History of Mankind*, which made Tylor's reputation. It showed great research, original insight and much constructive power in the formation of systematic views The chapters on early myths and their geographical distribution are especially valuable. In 1871 he published *Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Language, Art and Custom*, which at once became the standard general treatise on anthropology. Tylor first determined the limits of animism, intending it to include "the general doctrine of souls, and other spiritual beings." In 1881 Tylor published a smaller handbook on *Anthropology*. In 1871 he was elected F R S , and in 1883 he became keeper of the University museum at Oxford, and reader in anthropology in 1884. In 1888 he was appointed first Gifford lecturer at Aberdeen university, and delivered a two years' course on "Natural Religion" In 1896 he became first professor of anthropology at Oxford. Knighted in 1912, he died on Jan. 2, 1917.

See *Anthropological Essays*, a volume dedicated and presented to Tylor, which includes a bibliography of his publications by Miss Freire-Marreco, and an appreciation of Tylor by Andrew Lang.

TYMPANON or **TYMPANUM,** a name applied by the Romans to both kettledrum and tambourine. Pliny described half pearls having one side round and the other flat as *tympania*. In architecture the tympanum is the triangular space enclosed between any horizontal feature and any form of gable above it Though sometimes left plain, in the most celebrated Greek temples it was filled with sculpture of the highest standard ever attained

TYNAN, KATHERINE (Hmkson) (1863–1931), English novelist and poet, was born in Ireland where she lived until her marriage in 1893 to H. A. Hinkson, author and barrister She published her first volume of verse, *Louise de la Vallière*, in 1885. She is a prolific and versatile novelist and the author of many admirable children's books; she has written miracle plays, and edited several anthologies. Her best work is in poetry, where she expresses religious feeling and love of Ireland with tenderness and charm. Her collected poems were published in 1930.

Her publications include: *The Land of Mist and Mountain* (1895); *Miracle Plays* (1896); *The Handsome Brandons* (1896); *A Book of Memory* (1906), *Irish Poems* (1913); *The Middle Years* (1917); *Wives* (1924); *The Infatuation of Peter* (1926).

TYNDALE (or TINDALE), **WILLIAM** (*c.* 1492–1536), translator of the New Testament and Pentateuch (*see* BIBLE, ENGLISH), was born on the Welsh border, probably in Gloucestershire, some time between 1490 and 1495. In Easter term 1510 he went to Oxford, where Foxe says he was entered at Magdalen

Hall. He took his M.A degree in 1515 and removed to Cambridge, where Erasmus had helped to establish a reputation for Greek and theology. Ordained to the priesthood, probably towards the close of 1521, he entered the household of Sir John Walsh, Old Sodbury, Gloucestershire, as chaplain and domestic tutor. Here he lived for two years, using his leisure in preaching in the villages and at Bristol, conduct which brought him into collision with the backward clergy of the district, and led to his being summoned before the chancellor of Worcester (William of Malvern) as a suspected heretic; but he was allowed to depart without receiving censure or being given any undertaking.

Translation of the Bible.—But the persecution of the clergy led him to seek an antidote for what he regarded as the corruption of the Church, and he resolved to translate the New Testament into the vernacular. In this he hoped to get help from Cuthbert Tunstall, bishop of London, and so "with the good will of his master" he left Gloucester in the summer of 1523. Tunstall disappointed him, so he got employment as a preacher at St. Dunstan's-in-the-West, and worked at his translation, living as chaplain in the house of Humphrey Monmouth, an alderman, and forming a firm friendship with John Frith; but finding publication impossible in England, he sailed for Hamburg in May 1524. After visiting Luther at Wittenberg, he settled with his amanuensis William Roy in Cologne, where he had made some progress in printing a 4to edition of his New Testament, when the work was discovered by John Cochlaus, dean at Frankfurt, who not only got the senate of Cologne to interdict further printing, but warned Henry VIII. and Wolsey to watch the English ports. Tyndale and Roy escaped with their sheets to Worms, where the 8vo edition was completed in 1526. Copies were smuggled into England but were suppressed by the bishops, and William Warham, archbishop of Canterbury, even bought up copies on the Continent to destroy them. Attempts were made to seize Tyndale at Worms, but he found refuge at Marburg with Philip, landgrave of Hesse.

Other Works.—About this time he changed his views on the Eucharist and swung clean over from transubstantiation to the advanced Zwinglian position. His *Parable of the Wicked Mammon* (1528), *Obedience of a Christen Man* (1528), in which the two great principles of the English Reformation are set out, viz. the authority of Scripture in the Church and the supremacy of the king in the state, and *Practyse of Prelates* (1530), a strong indictment of the Roman Church and also of Henry VIII.'s divorce proceedings, were all printed at Marburg. In 1529 on his way to Hamburg he was wrecked on the Dutch coast, and lost his newly completed translation of Deuteronomy. Later in the year he went to Antwerp where he conducted his share of the classic controversy with Sir Thomas More.

After Henry VIII.'s change of attitude towards Rome, Stephen Vaughan, the English envoy to the Netherlands, suggested Tyndale's return, but the reformer feared ecclesiastical hostility and declined. Henry then demanded his surrender from the emperor as one who was spreading sedition in England, and Tyndale left Antwerp for two years, returning in 1533 and busying himself with revising his translations. In May 1535 he was betrayed by Henry Phillips, to whom he had shown much kindness, as a professing student of the new faith. The imperial officers imprisoned him at Vilvorde Castle, the state prison, 6 m. from Brussels, where in spite of the great efforts of the English merchants and the appeal of Thomas Cromwell to Archbishop Carandolet, president of the council, and to the governor of the castle, he was tried for heresy and condemned. On Oct. 6, 1536 he was strangled at the stake and his body afterwards burnt.

Though long an exile from his native land, Tyndale was one of the greatest forces of the English Reformation. His writings show sound scholarship and high literary power, while they helped to shape the thought of the Puritan party in England. His translation of the Bible was so sure and happy that it formed the basis of subsequent renderings, especially that of the authorized version of 1611. Besides the New Testament, the Pentateuch and Jonah, it is believed that he finished in prison the section of the Old Testament extending from Joshua to Chronicles.

Beside the works already named Tyndale wrote *A Prologue on the Epistle to the Romans* (1526), *An Exposition of the 1st Epistle of John* (1531), *An Exposition of Matthew v.–vii.* (1532), a treatise on the sacraments (1533), and possibly another (no longer extant) on matrimony (1529).

The works of Tyndale were first published along with those of John Frith (*q.v.*) and Robert Barnes, "three worthy martyrs and principal teachers of the Church of England," by John Day, in 1573 (folio). A new edition of the works of Tyndale and Frith, by T. Russell, was published at London (1828–1831). *His Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* was published by the Parker Society in 1848. For biography, see Foxe's *Acts and Monuments;* R. Demaus, *William Tyndale* (1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (1884), where a bibliography is given.

TYNDALL, JOHN (1820–1893), British natural philosopher, was born in Co. Carlow, Ireland, on Aug. 2, 1820. Tyndall was to a large extent a self-made man; he was stimulated to earnest study by the writings of Carlyle. He passed from a national school in Co. Carlow to a minor post (1839) in the Irish ordnance survey, thence (1842) to the English survey, attending mechanics' institute lectures at Preston in Lancashire. He then became for a time (1844) a railway engineer, and in 1847 a teacher at Queenwood College, Hants. Thence with much spirit, and in face of many difficulties, he betook himself, with his colleague Edward Frankland, to the university of Marburg (1848–1851), where, by intense application, he obtained his doctorate in two years. His dissertation was an essay on screw-surfaces.

Tyndall's contributions to science are due more to his personality and his gift for making difficult things clear rather than to his original researches. He became known through some early magnetic investigations and was elected F.R.S. in 1852. In May 1854 he was chosen professor of natural philosophy at the Royal Institution, a post which exactly suited his striking gifts and made him a colleague of Faraday, whom in 1866 he succeeded as scientific adviser to the Trinity House and Board of Trade, and in 1867 as superintendent of the Royal Institution. His reverent attachment to Faraday is beautifully manifested in his memorial volume called *Faraday as a Discoverer* (1868).

With his friend Huxley he went to Switzerland to study the motion of glaciers; his views brought him into conflict with Forbes and James Thomson.

Tyndall's investigations of the transparency and opacity of gases and vapours for radiant heat, which occupied him during many years (1859–1871), are frequently considered his chief scientific work. (*See* HEAT.) But his activities were essentially many-sided. He definitely established the absorptive power of clear aqueous vapour—a point of great meteorological significance. He made brilliant experiments elucidating the blue of the sky, and discovered the precipitation of organic vapours by means of light. He called attention to curious phenomena occurring in the track of a luminous beam. He examined the opacity of the air for sound in connection with lighthouse and siren work, and he finally verified what had been already substantially demonstrated, viz., that germ-free air did not initiate putrefaction.

Tyndall's devotion to science for its own sake may be seen in his treatment of the money which came to him in connection with his successful lecturing tour in America (1872–1873). He placed the money amounting to several thousand pounds in the hands of trustees for the benefit of American science—an act of lavishness which bespeaks a noble nature. He took some part in the controversy over theological problems which was going on at the time. He died at Hindhead on Dec. 4, 1893.

For the substantial publication of his researches reference must be made to the *Transactions of the Royal Society;* but an account of many of them was incorporated in his best-known books, namely, the famous *Heat as a Mode of Motion* (1863; and later editions to 1880), the first popular exposition of the mechanical theory of heat, which in 1862 had not reached the text-books; *The Forms of Water*, etc. (1872); *Lectures on Light* (1873); *Floating Matter in the Air* (1881); *On Sound* (1867; revised 1875, 1883, 1893). The original memoirs themselves on radiant heat and on magnetism were collected and issued as two large volumes under the following titles: *Diamagnetism and Magne-crystallic Action* (1870); *Contributions to Molecular Physics in the Domain of Radiant Heat* (1872).

TYNDARIS, an ancient city on the northern coast of Sicily, 5 m. east of Patti. It was founded (almost the last Greek city

in Sicily) by Dionysius the Elder in 395 B.C. It was one of the earliest allies of Timoleon. In the first Punic War it was dependent on Carthage, but expelled the Carthaginian garrison in 254 B.C. and joined the Romans. It was one of the points occupied by Sextus Pompeius, but was later used by Agrippa as a base. Pliny mentions that half of it (the north and north-east portion) was swallowed up by the sea (*Hist. nat.* ii. 206). The site is fine, an isolated hill (920 ft.) with spurs, rising abruptly seaward, and connected by a narrow isthmus with the lower ground inland. It has a magnificent view, including even the summit of Etna.

Remains of the city walls, built of rectangular blocks of stone, with several towers may be seen, and the main gate, on the land side, is traceable. Within are remains of a building incorrectly called the gymnasium, constructed of ashlar masonry, with three narrow halls, each about 90 ft. long; of a building with mosaic pavements, and a small theatre, the internal diameter of which is 212 ft., and the length of the stage 80 ft.

See R. V. Scaffidi, *Tyndaris* (Palermo, 1895). (T. A.)

TYNE, river in England, flowing into the North sea. The North Tyne rises, 80 m. from the mouth, at the south-west end of the Cheviot Hills, and has a wooded valley. At Bellingham it receives the Rede, whose valley, Redesdale, is the site of the battle of Otterburn (1388). The South Tyne rises below Cross Fell and flows north past Alston as far as Haltwhistle, where it turns east. The valley receives from the south the picturesque Allendale. The two branches join near Warden, above Hexham (30 m. from the sea) and the united stream continues past Corbridge, where a Roman road crossed it. In its last 15 m. the Tyne, here the boundary between Northumberland and Durham, is an important waterway, navigable up to Blaydon. Collieries and large towns line the banks—Newburn, Newcastle-upon-Tyne, Wallsend and North Shields on the north side, Gateshead, Jarrow and South Shields on the Durham side, with many lesser centres, forming continuous lines of factories and shipbuilding yards, necessitating the dredging of the river. At high-water spring tides there is 40 ft. of water at Shields Harbour at the river's mouth, and 29 ft. at Newcastle, 8 m. up the river.

TYNEMOUTH, municipal, county and parliamentary borough, Northumberland, England, including the townships of Chirton, Cullercoats, North Shields, Preston and Tynemouth. Pop. (1938) 66,510. Area, 7.3 sq. mi. North Shields, Tynemouth and Cullercoats are successive stations on a branch of the L.N.E.R. Tynemouth lies on the north bank of the Tyne, 8¼ mi. E. of Newcastle. Tynemouth is the principal watering place and residential district on this part of the coast.

On the point of the promontory on which it stands is a small battery called the Spanish battery. Within the grounds, to which the gateway of the old castle gives entrance, are the ruins of the ancient priory of St. Mary and St. Oswin—the principal remains being those of the church, which was a magnificent example of Early English work engrafted upon Norman. The municipal buildings are in North Shields, which is also an important seaport. (*See* NORTH SHIELDS.)

Although Roman remains have been discovered, the early history centres round the priory, founded (617–633) by Edwin, king of Northumbria. Earl Waltheof gave Tynemouth to the monks of Jarrow, and it became a cell to the church of Durham, but later, to the abbey of St. Albans in Hertfordshire. The priory was probably fortified in Saxon times, and was strengthened by Robert de Mowbray. After the Dissolution the fortifications were repaired by Henry VIII. In 1642 it was garrisoned for the king by the earl of Newcastle, but surrendered to parliament in 1644. It became barracks at the end of the 18th century.

Tynemouth and North Shields did not become important until the 19th century, the establishing of a port here and holding of fairs being prevented by the people of Newcastle. Before that time charters were granted in 1203 and 1204 to the prior and convent, and include freedom from toll, etc. In 1292 there were disputes between the citizens of Newcastle and the prior, who had built a quay at North Shields but was obliged by act of parliament to destroy it. After the Napoleonic wars the trade of North Shields rapidly increased. Fish quays were constructed and extended in the 20th century, and a considerable fishing trade is carried on. A 52-ac. trading estate was established at West Chirton. The depression of the 1930s was particularly felt here, and over 39% of the insured population was unemployed in Nov. 1934. The town was incorporated in 1849, became a county borough in 1901, and has returned one member to parliament since 1832.

TYPE, PRINTING: *see* PRINTING TYPE.

TYPE-CASTING MACHINES: *see* PRINTING TYPE; PRINTING.

TYPE METAL. An alloy containing antimony as the essential constituent; the other ingredient being lead, often with addition of tin and less frequently of copper. Metallic type containing antimony was used in the 17th century (Basil Valentine).

Antimony increases the fusibility and hardness of metals with which it is alloyed and imparts to these alloys its characteristic property of expansion on solidification. Typical alloys for printing type have the following proportions:—

	Lead	Anti-mony	Tin	Cop-per
Type metal	60	30	10	
"	70	18	10	2
"	77.5	16	6.5	
"	82	15	3	
Stereotype Metal	85.7	14.3	.	
" "	82.5	13	4.5	
Linotype Metal	84.5	13.5	2	
" "	82	13	5	
Cheap Linotype Metal	85.5	12	2.5	

The proportions given for linotype metals approximate fairly closely to the most fusible (eutectic) alloy of lead (85%), antimony (13%), with an addition of tin (2%). This alloy has the comparatively low melting point of 246°C., a degree of fusibility which renders it useful in the production of this form of type.

Type metal, being easily cast, is used for statuettes, metallic candlesticks and other decorative objects. A lead-antimony alloy (lead two parts to one of antimony) is used for the metallic keys of certain reed musical instruments.

So-called *hard lead* or *antimonial lead* containing antimony (15%) and lead (85%) is used for chemical stopcocks, *e.g.*, in the sulphuric acid industry. (G. T. M.)

TYPE SETTING: *see* PRINTING and TYPOGRAPHY.

TYPEWRITER, a machine which prints characters in sequence, performing the work of writing at a speed far greater than is possible with the pen. Formerly the term "typewriter" was also applied to the operator, but more recently the operator has become known as a "typist."

Early Machines.—The first recorded attempt to invent a typewriter is found in the records of the British Patent Office. These show that on Jan. 7, 1714, a patent was granted by Queen Anne to Henry Mill, an English engineer, for "an Artificial Machine or Method for the Impressing or Transcribing of Letters Singly or Progressively one after another, as in Writing, whereby all Writing whatever may be Engrossed in Paper or Parchment so Neat and Exact as not to be distinguished from Print." Mill's machine was never manufactured. Only one other attempt was recorded in the 18th century. This was a machine invented in 1784 for embossing characters for the blind. The first American patent on a typewriter was granted in 1829 to William Austin Burt of Detroit. The only model of this machine was destroyed by fire at the Washington Patent Office in 1836.

In 1833, a French patent was granted to Xavier Progin (or Projean), of Marseilles, for a device which he described as a "Krypographic" machine or pen. It consisted of an assembly of bars with type, each type striking downward upon a common centre. The Progin device was the prototype of all our present type-bar machines. The next important step was taken by Charles Thurber of Worcester, Mass., to whom an American patent was granted in 1843. In this machine the letter spacing was effected by the longitudinal movement of a cylinder or platen, a principle which is a feature of all present-day standard writing machines. A different model, brought out by Thurber in the year 1845, was designed to perform the motions of the hand in writing, and was intended for the blind. In the previous year a machine,

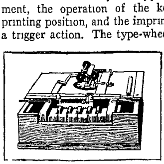
9. Portable typewriter, 1938



also intended for the blind, was shown by Littledale at the York meeting of the British Association. Pierre Foucault, a teacher in the Paris Institute for the Blind, patented a machine in 1849 that was shown at the great exhibition in London in 1851, and is said to have embossed characters for the blind admirably.

From 1850 the attempts became more numerous. Among those who took out patents in America during this period were Oliver T. Eddy of Baltimore, in 1850, J B Fairbanks, 1850, J. M Jones of Clyde, N Y, 1852, R. S Thomas of Wilmington, N C., 1854, Alfred Ely Beach of New York, 1856, J. H Cooper of Philadelphia, 1856, Dr. Samuel W. Francis of New York, 1857, Henry Harger, 1858, F. A. de May of New York, 1863, Benjamin Livermore of Hartland, Vt, 1863, Abner Peeler of Webster City, Ia, 1866, Thomas Hall, 1867, and John Pratt of Centre, Ala., who in 1866, while a resident in London, produced a device called the "Pterotype" (winged type), which operated on the type-wheel principle. Contemporary efforts by European inventors were those of Sir Charles Wheatstone in England, who constructed several experimental models between 1855–60; the Ravissa machine in Italy belongs to that period, and the models built by Peter Mitterhofer of the Tyrol, in 1864 and 1866 Among the most promising of these efforts were those of Beach and Francis Beach's machine operated in much the same manner as a modern typewriter, but it wrote only on a narrow ribbon of paper This machine, like so many others of this period, was designed for the blind, and printed raised letters which could be read by touch. The machine invented by Dr. Francis was a bulky affair, with keys like those of a piano. Type-bars were arranged in a circle, printing at a common centre

First Practical Typewriter.—The invention of three residents of Milwaukee, Wis., Christopher Latham Sholes, Carlos Glidden and Samuel W Soulé, in 1867, resulted in the first practical machine. Soulé soon retired from the undertaking, but Sholes, within five years, made nearly 30 experimental models. The first of these, showing the working principles only, was covered in patent of June 23, 1868. The second one, patent of July 14, 1868, was the first efficient typewriter model, in that it would write well, at a speed far exceeding the pen. It was still, however, a very crude machine, lacking the now familiar typewriter carriage, with its paper cylinder, and the keyboard in its present form. Many improvements followed and finally, on Mar. 1, 1873, a contract was made with E. Remington and Sons, gunmakers, of Ilion, N Y, for the development and manufacture of the Sholes and Glidden machine. The first completed typewriters were placed on the market early in 1874 and the machine was soon re-named the Remington Among its original features which remain standard in 1928 machines are the paper cylinder, with its line-spacing and carriage-return mechanism, the escapement which causes the letter spacing, the arrangement of the type-bars so as to strike the paper at a common centre, the actuation of the type-bars by means of key levers and connecting wires, printing through an inked ribbon, and the positions of the different characters on the keyboard, which conform almost exactly to the arrangement now known as "universal."

The first typewriter had no shift-key mechanism—it wrote capital letters only. The problem of printing both capitals and small letters without increasing the number of keys was solved by pl[illegible] two t[illegible] a capital and small face of the same letter [illegible] one for every character [illegible] practised only by operators of exceptional skill. In the latter decade, however, it rapidly gained acceptance and since 1900 it has been practically the universal method of instruction

Another early issue in the field of the typewriter concerned the relative merits of the type-bar and the type-wheel principles. The latter construction traces its descent through the Burt machine of 1829 and the Pratt machine of 1866. In modern machines of this variety the types are mounted on a circle or segment, the operation of the keys brings each type to correct printing position, and the imprint of type on paper is produced by a trigger action. The type-wheel machines offer an advantage in the ease with which the type segments may be changed, thus extending the range and versatility of the machine. However, machines of this construction have never been very serious competitors of the type-bar machines in the general commercial field. On nearly all typewriters the printing is done through an inked ribbon, which is fitted on spools, travels with the operation of the machine, and reverses automatically when one spool becomes completely unwound, the latter improvement dating from the year 1896.

BY COURTESY OF THE REMINGTON TYPEWRITER CO

SHOLES' FIRST MODEL OF THE TYPEWRITER

Following the first shift-key typewriter of 1878, the next great advance was the advent of visible writing. On all of the early type-bar machines the bars were arranged in a circular "basket," located underneath the carriage, and the type printed at a common point on the under side of the cylinder This construction compelled the operator to raise the carriage in order to see the writing line. The first visible writing machine appeared in 1883 The earlier visible machines employed the down-stroke principle, the type striking on top of the cylinder Later the front-stroke machines took the lead in the general business field, the first machine of this type to attain prominence dating from 1897. In front-stroke machines the type-bars are placed in a segment in front of the carriage, the type printing on the front of the cylinder. This solved the problem of visible writing and all writing machines of the leading standard makes are of this type.

Recent Developments.—Since the advent of visible writing there have been two other major developments in the general typewriter field, the development of the portable and the noiseless machine. The former—small, light, compact and easily carried—is especially designed for the owner's personal use. The earliest of these was a small machine of the type-wheel variety. The first type-bar portable to attain a considerable market appeared in 1912 Type-bar portable machines of all the leading makes are on the market, and their sale is extending the use of the typewriter to every kind of personal writing. The noiseless machine is a front-stroke machine of the type-bar variety, equipped with the usual standard keyboard. It differs, however, from other type-bar machines in that the printing is done not by percussion but by pressure, thus reverting to the principle of the printing press. This is accomplished by means of a little weight on the back of the type-bar As the type-bar starts, this weight gathers momentum and presses the type against the paper, swiftly and noiselessly. It is too early as yet to predict the future of the noiseless typewriter, but it is obviously growing in popularity.

Form and Tabular Work.—The extension of the uses of the typewriter to form and tabular work of every kind constitutes a distinct and separate development. During the first 25 years of its history, the time-saving service of the typewriter was confined almost entirely to straight, line-by-line writing, such as letter and manuscript writing, and the like This limitation was due to the lack of any mechanism for the instantaneous setting of the carriage at any desired writing point. This need, however, was supplied by the decimal tabulator, which appeared in 1898. This device permitted the writing of columns of figures, anywhere on the page and as many as the page would hold, with the same speed as ordinary work. From this improvement the advance to the machine which would add the columns as written was a natural transition. The first *adding typewriters* added in vertical columns only, but from these in turn have been evolved the complete bookkeeping or accounting machines, which write and add (or subtract)

simultaneously, both vertically and across the page, in any combination that the work requires. In this field the standard typebar machines, with tabulating and computing mechanisms, have a competitor in the so-called flat-platen machine, which is similar in its combined writing and adding performance, but prints on a flat bed instead of a travelling and revolving cylinder (*See* TABULATING MACHINES.)

The service rendered by the accounting or bookkeeping machine is broadly that of the ordinary typewriter, intensified The combination in one operation of two tasks, writing and adding, eliminates the separate adding cost. A further advantage is the error proofing of every task, the machine furnishing its own accounting controls.

The application of electricity to the operation of the machine has made its greatest advance in the accounting machine field. At least one operation, the return of the carriage, is usually performed by electric drive.

In the general typewriting field, several manufacturers brought out electrically operated machines

The typewriter has been one of the great transforming factors of modern business. One problem which confronted the writing machine in its early days was the securing of competent operators. Out of this need arose the modern commercial school, now a prominent feature in the educational system of every country. Socially the changes wrought by the typewriter have been even more noteworthy. Everywhere except in oriental countries the majority of stenographers and typists are women, and it is historically established that in all western countries, beginning with America, it was the typewriter that first opened to women the doors of business life (A. C RE.)

TYPHOID AND PARATYPHOID FEVERS. Typhoid fever is an acute infectious disease of man caused by a bacterium, *Salmonella typhosa* (*Bacillus typhosus*, *Eberthella typhi*) It is characterized by an insidious onset, high and continued fever, prostration, mental confusion and delirium, a specific skin rash on the trunk ("rose spots"), diarrhoea, specific lesions of the bowel and numerous complications.

This disease is ancient It can be recognized with reasonable certainty in clinical descriptions by medical writers dating back to the time of Hippocrates However, it was not until the first half of the 19th century (P. Bretonneau, 1820) that typhoid fever (enteric fever) was clearly distinguished from other continued fevers and termed "fièvre typhoïde" (P C. A Louis, 1829) by the French and "typhus abdominalis" (J. L. Schoenlein, 1839) by the German writers

Before the advent of bacteriology, the infective and contagious nature of the disease was recognized by William Budd in 1856, and the presence of the infective agent in the faeces of ill and convalescent patients and its spread through contaminated water and milk was postulated. The recognition of the typhoid bacillus by C. J. Eberth in 1880 and its isolation in pure culture by G. Gaffky in 1884 laid the foundation for the development of knowledge leading to accurate means of diagnosis, critically differentiating this disease from all others, and making possible studies to determine the means of spread and methods of prevention

The organism usually enters the body through the mouth, in contaminated food or water, penetrates the intestinal wall and multiplies in the lymph follicles (Peyer's patches and solitary lymph glands) near the lower end of the small intestine (ileum), particularly in the region of the ileocaecal valve, and possibly in other locations in the body, later entering the blood stream resulting in septicaemia and systemic infection. The incubation period averages 10–14 days but may be shorter or longer. There are few or no symptoms during this period. Early symptoms are headache, lassitude and generalized aching, feverish sensations and restlessness which may interfere with sleep. There may be loss of appetite, nose bleeds, cough, diarrhoea or constipation. Persistent fever develops and gradually rises, usually in a step-wise fashion, reaching a high of 103° or 104° F. after 7–10 days and continuing with only slight morning remissions for another 10–14 days In favourable cases, about the beginning of the fourth week the fever commences to decline, daily fluctuations in temperature readings become greater and there is a gradual return to normal.

In the first few days of the disease, the patient may remain ambulatory, but before the end of the first week he is seriously ill and confined to bed He is restless, hot and uncomfortable, and the cheeks are flushed, particularly in the latter part of the day. The pulse is slow, the abdomen is slightly distended and may be tender to pressure, especially over the right lower part, the region overlying that portion of the intestines where a specific ulceration is in progress Diarrhoea is frequent but by no means a constant symptom. When present, it may be slight or extremely profuse, the stools are light yellow in colour, resembling pea soup At the beginning or during the second week of fever at the height of the septicaemia when typhoid bacilli are present in great numbers in the blood stream, a skin rash usually appears. It consists of isolated round or oval spots of a pale pink or rose colour measuring from 2 mm to 4 mm. in diameter These "rose spots" are usually few in number and are found chiefly on the abdomen, chest and back. They appear in crops, last four or five days and then fade away, leaving a brownish stain at the site. Occasionally they may be very numerous and may continue to appear until near the end of the fever. Also during the second week of the fever, specific changes are occurring in the intestine The lymph follicles previously mentioned as the site of multiplication of the typhoid organisms during the incubation period have become swollen and enlarged, and portions have undergone necrosis (death of tissue) These areas of necrotic tissue extend through the mucous membrane to the lumen of the bowel. Necrotic fragments or entire glands slough off, leaving ulcers in the wall, which may be few or numerous, have thin ragged edges and are usually oval, extending in the direction of the long axis of the bowel. They may in their progress erode blood vessels, causing minor or massive haemorrhage into the bowel, or perforate the bowel wall, allowing the contents to enter the peritoneal cavity Ulceration exists from this time onward during the remainder of the fever and into the period of convalescence The ulcers heal by formation of scar tissue without contraction of the calibre of the bowel They do not all appear at once, so that ulcers in all stages of development and healing may be simultaneously present

With the continued high fever the symptoms usually increase in intensity Mental confusion and delirium appear; there may be tremors and jerking of the muscles and occasionally generalized convulsions. By the end of the third week the patient presents the so-called "typhoidal state"; he appears prostrated and emaciated, the tongue is dry and brown, abdominal symptoms are marked and mental disturbance is prominent

With cessation of fever, convalescence proceeds slowly. Relapses are common but usually of short duration

Typhoid fever is a disease of complications. By eroding blood vessels, the intestinal ulcers may cause massive and even fatal haemorrhage; haemorrhage occurs in from 5% to 10% of the cases. Perforation of the bowel (1% to 5%) results in peritonitis which prior to the advent of the sulfonamides and antibiotics was highly fatal. The patient experiences a sudden intense abdominal pain, vomits and shows signs of collapse. This development demands immediate surgical intervention for repair of the defect and the start of intensive antibiotic therapy. Osteomyelitis, chiefly of the long bones, may occur even some time after cessation of the fever. Localization and abscess formation may occur in any organ

Other complications include acute inflammation of the gall bladder, heart failure, pneumonia, encephalitis and meningitis. Death may result from toxaemia and general debilitation, or from one of the complications.

The mortality rate varies widely and is influenced by the quality of nursing and medical care. For the world at large in 1948, the average case mortality was about 9%.

Bacteriology.—*Salmonella typhosa* is an actively motile, short, rod-shaped, nonspore-forming Gram-negative bacillus. It grows readily on common culture media. Special complex differential media were developed for isolation from stools. It can be distinguished from other organisms of the *Salmonella* group by its biochemical reactions, particularly sugar fermentations, and by

serological reactions. The organism is destroyed by heat, drying or exposure to sunlight; under natural conditions, as in water, soil or faeces, it may remain alive for weeks or months. It is not destroyed by freezing.

In typhoid fever during the first week of the disease, the organism is almost invariably present in the blood stream and can be cultured from the blood with ease. From the second week onward the numbers in the blood progressively diminish Although positive stool cultures may be obtained early in the disease, the organism becomes present in large numbers in the faeces only during the second week It also usually appears in the urine at this time. With convalescence the urine and faeces gradually become free of the organism

Approximately 30% of cases become transient carriers excreting the organism in the stool or urine for several weeks or months About 5% remain long-term carriers, harbouring the organism and shedding it for several to many years In these carriers, who show no apparent ill effects, it is found mainly in the gall bladder and biliary passages. It may be excreted continuously or intermittently.

Diagnosis.—The clinical picture should suggest the diagnosis Leucopenia (lowered white blood cell count) is characteristic and eliminates many other diseases from consideration Final proof of the diagnosis depends on isolation and identification of the organism in culture from the blood, urine or faeces.

As with many infectious diseases, specific antibodies arise in the blood of the patient which will agglutinate (clump) suspensions of known typhoid organisms. This test, first applied in typhoid fever by F Widal in 1896 and named after him, is of presumptive value in diagnosis after the first week of the disease

Dissemination.—Every case of typhoid fever is due to ingestion of typhoid bacilli originating from a case of the disease or from a carrier The common means of communication are through water, milk, food, flies and direct contact. The organisms are excreted in the urine and faeces, with a case, these excreta and the patient's bedding and environs are a source of exposure to attendants and others in contact with him. Water contaminated by infective faecal material (sewage) provides a major means of spread.

Most major epidemics have been due to such pollution of public water supplies. Milk may be contaminated through a carrier (or a case) employed in the handling and processing, through flies or from polluted water used for cleaning purposes Food similarly becomes contaminated from the fingers of persons harbouring the organism, or through water or flies. Flies having access to infective faeces carry the organism to food. Fresh vegetables grown on soil fertilized or contaminated by untreated sewage and shellfish, particularly oysters, grown in polluted water are dangerous. Milk and other foods offer opportunity for the organism to multiply before ingestion, increasing the hazard.

Prevention and Treatment.—Prevention depends mainly on proper treatment of sewage, purification of water supplies by filtration and chlorination and the exclusion of carriers from employment in food industries In 1911 prophylactic vaccination using killed typhoid organisms was introduced, mainly in military forces and institutions, and contributed to lowering of the incidence of the disease.

The disease, a scourge of armies, was formerly extremely prevalent and remained so at mid-20th century in the less sanitized areas of the world. With improvement in sewage disposal and water purification, the incidence dropped to a very low figure. In the United States in 1900, the annual death rate was more than 30 per 100,000 population; by 1945, it was 0.25 per 100,000.

Treatment formerly was entirely symptomatic and supportive Specific treatment with chloramphenicol (chloromycetin) later proved to be of value.

PARATYPHOID FEVER

A group of organisms are responsible for paratyphoid fever, the commonest being *Salmonella paratyphi* (paratyphoid A), *S. schottmulleri* (paratyphoid B), and the paratyphoid C group (there are three varieties, *S. hirschfeldii*, *S. choleraesuis*, and the *kunzendorf* variety of the latter).

Paratyphoid fever due to paratyphoid A or B is similar to typhoid, usually milder, though occasionally simulating it in all respects. The means of infection, spread, clinical course, pathology, diagnosis, prevention, treatment and prophylaxis are similar to those for typhoid.

Whereas typhoid and paratyphoid A are diseases of man only, the paratyphoid B organism has been found in other animals and fowl, and accordingly these provide for additional means of contamination of food and water. *S. hirschfeldii* is mainly limited to man.

There are more than 200 recognized species of the *Salmonella* (named after D. E. Salmon who described the type species *S. choleraesuis*) group of organisms which are widely distributed over the world. In the man they are harboured by or cause disease of animals, though many may infect man.

Aside from the typhoid bacillus and paratyphoid A, B, and *S. hirschfeldii*, they usually cause in man a sharp, brief gastroenteritis (food infection) with fever, nausea, vomiting and diarrhoea of seven days' duration. In addition, a number of them may cause prolonged febrile illness similar to typhoid with all the complications.

Since *Salmonella* organisms may be found in practically all species of animals, food products derived from animals often contain them, particularly eggs, egg products and meat. Many species are harboured by rodents and fowl Food exposed to infected animals (mice, etc.) frequently becomes contaminated

The general prophylactic measures mentioned under typhoid apply to the entire group. Prophylactic immunization is available for paratyphoid A, B and C Protection of food from contamination and adequate heat treatment of foods liable to contain the organism should be practised

TYPHON, in Greek mythology, youngest son of Gē and Tartarus; or of Hera without father (*Homeric Hymns*, iii. 349 *et seq.*). He is described as a grisly monster, with 100 dragon's heads, who was conquered and cast into Tartarus by Zeus. In other accounts, he was confined in the land of the Arimi in Cilicia (*Iliad*, ii. 783) or under Etna (Aeschylus, *P.V.* 370), or in other volcanic regions, where he was the cause of eruptions. He was probably a personification of volcanic forces. Amongst his offspring by Echidna were Cerberus, the Lernaean hydra, and the Chimaera. He was also the father of dangerous winds, and by later writers is identified with the Egyptian Set.

TYPHOON. Regional name of tropical storms in the tropical part of the western North Pacific ocean. The term is of uncertain origin but is probably connected with the Chinese *t'ai fung*, great wind, or the Arabic and Hindustani *tufan*, a tempest. William Dampier entered in his logbook under July 4, 1687, the earliest known European description of a typhoon (tuffoon).

TYPHUS FEVER, a disease characterized by sudden onset with headache, chills, fever and general pains, a macular eruption appearing on the third to fifth day, toxaemia, and terminating in about two to three weeks. Originally considered a single clinical entity, it is now regarded as a group of closely related diseases caused by different species of rickettsia transmitted by arthropod vectors, under the following general classifications A–1, epidemic (louse-borne) typhus; A–2, murine (endemic; flea-borne) typhus; B, scrub (mite-borne) typhus or tsutsugamushi disease; C, tick-borne typhus (*see* ROCKY MOUNTAIN SPOTTED FEVER).

A–1. EPIDEMIC (LOUSE-BORNE) TYPHUS

History and Distribution.—This is the classic disease well

known in medical history and described under many names which usage gradually narrowed to typhus fever (English), *fleckfieber, typhus exanthematicus* (German), *typhus exanthématique* (French), *tabardillo, tifo exantemático* (Spanish), *typhus esantematico* (Italian) Up to the middle ages its existence was obscured in the undifferentiated pestilences, but it can be recognized with certainty in the writings of Spanish physicians toward the end of the 15th century styled as *el tabardgilo* from its spotted character According to Joaquim de Villalba, the first reference to an epidemic was one which began during the civil wars of Granada, 1489–90. During the 16th century it spread over the Spanish peninsula, causing great mortality It is possible that the infection was transported to the new world about this time by Hernan Cortes and his followers, although there is some evidence that the disease was known to the Aztecs and to certain Indian tribes in Mexico in pre-Columbian days During the 17th, 18th and 19th centuries, typhus prevailed intermittently in devastating epidemics throughout Europe and the British Isles. Its epidemiological characteristics became as well known as its clinical manifestations. It was associated with human misery—with people crowded together in filth, cold, poverty and hunger, with wars and famine, with refugees, prisons and jails and with ships. Beginning about 1846, and associated with the failure of the potato crop, an epidemic of unprecedented magnitude and severity centred in Ireland The disease was disseminated in the subsequent flood of emigration from that country. It was repeatedly introduced into Canada and the United States by the arrivals of immigrant ships For example, of 75,540 Irish persons emigrating to Canada in 1847, there were 30,265 who sickened with typhus, 5,203 died at sea, 8,012 at Quebec and 7,000 at Montreal, a total of 20,305 deaths In spite of repeated introductions from Europe and from Mexico, this form of typhus failed to establish a permanent foothold in either Canada or the United States The American Civil War of 1861–65 was one of the few wars of any magnitude in which typhus was not epidemic among military camps, prisons and refugee populations.

Clearly differentiated from typhoid fever and "relapsing fever," during the latter part of the 19th century and the first part of the 20th century typhus fever decreased and practically disappeared from the British Isles and western Europe with improvement in the hygiene of living conditions. It remained intermittently epidemic in Poland, the USSR, the Balkans, the highlands of Turkey, Iran, Iraq, North Africa and some parts of central and South Africa

At the close of World War I the disease was prevalent in Poland, Russia and Rumania, where the estimates of cases and deaths between 1919 and 1923 ran into millions In World War II from these areas it again spread into western Europe and caused devastating epidemics among refugees and displaced persons, particularly in the German concentration camps. For the first time military populations learned how to protect themselves

In Asia, the disease was still well known at mid-20th century in China, Korea, Afghanistan and northern India, outbreaks were reported among Communist troops in the Korean war. In the western world epidemics still occurred from time to time among the natives of the mountainous sections of Mexico and Central and South America

Epidemiology.—The epidemiological distributions of typhus are explained by its mode of transmission It is conveyed from person to person by the louse (*Pediculus humanus*). Lice are infected by feeding upon a person sick with the disease. The causative agent is a rickettsia (*Rickettsia prowazekii*) The microorganisms grow in the epithelial cells lining the gut wall and are excreted in the faeces of the louse. The infection kills the louse in from 12 to 18 days. There is no transovarial transmission of these rickettsiae from generation to generation in the developmental cycle of the louse It is probable that man is commonly infected from deposits of louse faeces on the skin through abrasions resulting from scratching. Rickettsiae may remain viable and retain their virulence for many days in dried louse faeces. There is evidence that inhalation or the deposition on mucous membranes of air-borne infected maternal of this kind may be responsible for some human cases Biological survival requires that a continuous chain of contacts be maintained The human host harbours the rickettsiae in the peripheral circulation only for a short time, 10 to 14 days, during the early part of the illness In order to maintain propagation of the disease in a population the supply of infected lice must be continuously replenished by feeding upon such sources and reach new and susceptible human beings before they perish

Clinical and Pathological Features.—The incubation period is about 8 to 12 days, but varies between 5 and 15 days. Onset is commonly abrupt, with headache, loss of appetite and malaise The fever rises rapidly with chills or chilly sensations Prostration becomes marked The patient is nauseated The temperature reaches a maximum range by the end of the first week and is sustained until about the 12th day, when, if the outcome is favourable, it falls rather rapidly, reaching normal in an uncomplicated course about the 14th to 16th day.

In cases proceeding to a fatal issue prostration is progressive and delirium and coma supervene. Cardiac failure may be the terminal event In recovery, depression and weakness may be protracted with slow convalescence.

The most characteristic symptom of the disease is the eruption which appears about the fourth to sixth day after onset It consists of dark reddish discrete spots two to five millimetres in diameter, some of which become slightly elevated, scattered over the body and limbs It may be accompanied by a general mottling These lesions at first are erythematous (abnormally red) and disappear on pressure, but rapidly become darker in colour and more petechial in character, leaving a brownish stain in the skin if the area is blanched. In the more severe and fatal cases the rash becomes almost confluent, involving the whole body surface, and subcutaneous haemorrhages occur. With recovery the rash fades slowly The case fatality varies somewhat in different epidemics, ranging from about 5% to 25%. The prognosis becomes more and more grave with advancing age While the proportion of deaths among children may be less than 5%, it may be ten times as great among the aged

The course and characteristics of the illness in man are manifestations of the underlying pathology. The rickettsiae localize and multiply in the endothelial cells lining the blood vascular system. The essential lesion is a focal injury to the capillary and precapillary vessel walls characterized by swelling and necrosis of the cells, infiltration of lymphocytes, plasma cells and monocytes, thrombosis and rupture with extravasation of red blood cells. Such lesions are significantly frequent in the skin, giving rise to the eruption, in the cerebral cortex they cause headache, irritability, confusion and delirium, in the heart muscle, weakness and sometimes circulatory failure, in the alveolar walls of the lung, an interstitial pneumonia, and they are widely scattered but less important in other organs and tissues. It has been demonstrated that suspensions of rickettsiae have an acute toxic effect when injected intravenously into mice To this toxic substance, which is neutralized by immune serums, may in part be attributed the host cell damage and interference with normal function

Diagnosis and Treatment.—The characteristics of the rash usually lead to the clinical diagnosis Laboratory confirmation is afforded by the Weil-Felix agglutination reaction, which becomes positive during the second week or later for Proteus OX_{19} and, usually in the lower titre, for Proteus OX_2. A more specific and delicate test is afforded by complement fixation using a suspension of the specific aetiologic rickettsia as an antigen. The causative agent can be recovered and identified by inoculating guinea pigs intraperitoneally with blood obtained from the patient in the early stages of the disease

The treatment of typhus is symptomatic and supportive. It is largely a matter of good nursing care, maintenance of nutrition and fluid balance. Parenteral administration of 5% glucose in normal saline is indicated by clinical evidence of dehydration. Analgesics and sedatives may be required to relieve pain and restlessness. On the basis of preliminary therapeutic trials, it appeared at mid-20th century that aureomycin exerted a definite effect on the course of the disease. In an adult, an oral dosage

regimen of 0 25 g., given every 3 hours, is continued until the patient has been afebrile for 24 hours Therapy usually lasts two to three days and is effective at any stage in the course of the disease.

Prevention.—*Delousing.*—The prevention of typhus depends upon protection from lice. Doctors, nurses and orderlies should be provided with louseproof clothing. The patient, his immediate environment and his contacts should be subjected to a thorough delousing procedure. Clothing may be disinfested by several methods using heat or pediculicide powders. The louse-infested patient should be bathed and the hair of the head and body clipped. Disinfestation can be accomplished most expeditiously and effectively by dusting with a 10% DDT louse powder It is blown from a hand-operated dust "gun" and can be applied without removal of the clothing. It does not kill nits but remains active and kills lice as they hatch for a considerable period. About one pound of powder is required for every 15 persons.

Vaccination.—Specific vaccines are produced by cultivation of rickettsiae in the yolk sacs of developing eggs or in the lungs of mice The resulting suspension is inactivated by adding 0 3% formal saline in appropriate quantity. The vaccine in a dosage of one millilitre is given in a series of three injections at approximately weekly intervals The protection afforded is not complete, however. If infection occurs in a recently vaccinated person, the disease usually runs an abortive course with little or no eruption. The risk of death is reduced A stimulating dose of one cubic centimetre of the vaccine should be administered every four to six months as long as danger of infection exists.

With proper public health organization, adequate resources and the discriminating use of methods available for vaccination and for delousing, epidemics of typhus fever need not be feared With a reasonable expenditure and effort they can be brought under control in a short period of time It is still an ever-present threat, however, to the primitive, impoverished and destitute peoples in many parts of the world.

A–2. MURINE (ENDEMIC; FLEA-BORNE) TYPHUS

History and Distribution.—Following the elucidation (1909–18) of the role of the common louse in the epidemiology of the classic typhus of the old world, it soon became apparent that in some parts of the world a disease was endemic which was clinically indistinguishable from it except for a relatively milder course and a lower fatality rate, and which was not associated with lousiness. It was described under such names as Brill's disease,[1] endemic typhus, mild typhus and tropical typhus. Studies conducted between 1922 and 1928 revealed widespread distribution of this form in the southeastern United States, in southern California and in Mexico. It was later found to exist in certain areas of Central and South America, the Mediterranean littoral, the Balkans, China, India, Malaya, Indonesia and Australia, and probably has a much wider distribution, overlapping to some extent the areas in which epidemics of louse-borne typhus occur.

Originally regarded as of minor importance in the United States, during the ten-year period 1932–41 more than 20,000 cases were reported.

Epidemiology.—The Norway rat is the principal reservoir of infection Occasionally, the common house mouse and other species of small rodents have been found to be infected. While several species of fleas and mites found upon rats are experimentally infectible, there is reason to believe that the tropical rat flea *Xenopsylla cheopis* is the principal vector. Transmission to man probably occurs through the medium of infected flea faeces. Inasmuch as this is an accident, the frequency of occurrence of human cases is determined by the character of man's association with his domestic rodents Passage from man to man by the flea is extremely unlikely, but it has been demonstrated that lice can be experimentally infected by feeding upon humans sick with the murine form of the disease. *It* is possible, thus, that the endemic flea-borne form may occasionally give rise to the epidemic louse-borne form where conditions are favourable

Clinical Course, Diagnosis and Treatment.—The course of the illness is essentially the same as for louse-borne typhus except with regard to severity. It is relatively milder, complications are less frequent and the over-all fatality rate is less than 5% The underlying pathology is similar. The Weil-Felix reaction becomes positive during the second week and the serum titre is usually higher with OX_{19} than OX_2, negative with OX_k. Complement fixation with properly prepared antigens affords a differentiation between the flea-borne and louse-borne forms. These forms can also be distinguished by the reaction of guinea pigs to experimental infection. With a murine strain the male guinea pig develops redness and swelling of the scrotum (Neill-Mooser reaction) which is absent or inconsistently present in animals inoculated with an epidemic strain Treatment of the patient follows the lines indicated for louse-borne typhus.

Prevention.—Prevention of murine typhus is dependent upon control of the rodent flea reservoir of infection. The number of rats, and consequently of rat fleas, must be reduced below the threshold of sanitary significance In an area of high prevalence the flea population may be rapidly but temporarily reduced by applying a residual spray of DDT along rat runs A vaccine made from a murine strain of typhus rickettsia should afford some degree of protection to persons especially exposed through occupation or living in buildings heavily infested with rats in an endemic focus.

B. SCRUB (MITE-BORNE) TYPHUS (TSUTSUGAMUSHI DISEASE)

History and Distribution.—A typhuslike fever ascribed to the bite of a minute insect was known to the natives of certain river valleys in Honshu, Jap , in the mid-19th century K Tanaka in 1899 presented a careful description of its clinical and epidemiological features and identified the vector as a mite found in large numbers in the affected valleys during the summer months, when most of the cases occurred From 1906 to 1932, tsutsugamushi disease was the subject of intensive investigation by Japanese scientists In the meantime, typhuslike fevers had been described under many names as endemic in localities scattered through southeastern Asia and the adjacent island archipelagoes As a result of the studies of Japanese, British, French, Dutch and Australian investigators, and of the U S Typhus commission during World War II, it became clear that these belong in two categories. (1) flea-borne murine typhus and (2) mite-borne typhus fever, scrub typhus, indistinguishable from tsutsugamushi disease. The latter was recognized as occurring in Formosa, the Pescadores Islands, the Philippines, Indochina, Malaya, Burma, India, Ceylon, Sumatra, Java, New Guinea and adjacent islands and northern Queensland, Austr. During World War II this form of typhus was far more important as a cause of morbidity and mortality to military forces operating in the southwest Pacific area and in the China-Burma-India theatre than was louse-borne typhus to the forces operating in the Mediterranean and European theatres.

Epidemiology.—The causative agent, *R tsutsugamushi*, is primarily a parasite of trombiculid mites of which two closely related species were identified as vectors—*Trombicula akamushi* and *T deliensis* During the larval stage these mites attach themselves to and feed upon various species of wild rodents, and are occasionally found upon other animals such as shrews and marsupials and upon birds Rodents were found to be infected in nature with *R. tsutsugamushi* (*Microtus montebelli* in Japan, *Rattus concolor browni* in New Guinea, *Rattus concolor concolor* in Burma) Infection contracted by the larvae while feeding is passed by stage to stage transfer through the lymph, free-living adult and egg to the next generation. Since the larvae feed but once upon a mammalian host, transmission from rat to rat and from rat to man requires this transovarial passage of the infection with *R. tsutsugamushi* in successive cycles of trombiculid with development It follows that the distribution of the human disease is determined

[1] In 1910 Nathan Brill called attention to a disease in New York city which resembled typhus but differed from it in its relatively mild course and epidemiological features It occurred sporadically among Jewish immigrants and showed no tendency to spread. In 1934 Hans Zinsser reviewed the distribution of this typhuslike disease in New York city and Boston, Mass On the basis of his observations, he advanced the hypothesis that these cases represented recrudescences of infections originally acquired many years previously, when the individual had been living in a European country where louse-borne typhus was epidemic. This hypothesis received support from later laboratory studies, which demonstrated conclusively that cases of Brill's disease were infected with typhus of the louse-borne type and not the murine type.

by the ecology of the affected localities, with regard to the number of rodents, numbers of the vector species of mites and the opportunities for the larval mites to make effective contact with human beings. The larvae live in the upper layers of the soil and the organic detritus which covers it and crawl short distances up on blades of grass and other vegetation. Accordingly, the disease shows an occupational selection for agricultural labourers, natives foraging in new or overgrown fields and abandoned plantations, explorers and prospectors, soldiers, etc.

Clinical Course, Diagnosis, Pathology and Treatment.—The distinguishing characteristic of this form of typhus is the occurrence of a primary lesion or eschar, usually single but sometimes multiple, at the site of the infective mite bite or bites. While not always present, an eschar can usually be found by careful examination somewhere on the patient. The eruption is more erythematous, macular and evanescent than in louse-borne typhus or flea-borne typhus. While the course of the fever may be terminated in two weeks, it is not unusual for it to last three or even four weeks A more or less extensive pneumonitis is common, and lesions in the myocardium may give rise to impairment of cardiac function and sometimes to circulatory failure. The case-fatality rate varies in different geographic areas from about 2% to 20%. The prognosis becomes increasingly grave with advancing age.

Diagnosis is usually made on the presence of fever, the primary eschar and characterstic eruption. Laboratory confirmation is afforded by the Weil-Felix reaction, which becomes positive during the second week of the disease with Proteus OX_{19} negative with OX_{19} and OX_2. About the same time, complement fixation becomes positive with an antigen made from a suspension of *R tsutsugamushi* The aetiologic agent can be easily recovered and demonstrated by intraperitoneal inoculation of white mice with a minute amount of clotted blood obtained from the patient early in the course of the disease. As with other typhuslike fevers treatment is symptomatic and supportive. J. E Smadel and his colleagues demonstrated that the clinical reaction can be completely suppressed by the administration of chloramphenicol (chloromycetin). In an adult, this requires that the drug be given in doses of three to four grams, at intervals of four to seven days, for four weeks or longer.

Prevention.—Prevention depends upon protection from mite bites in the endemic area. Camp sites should be cleared and the brush and grass burned before occupation. The individual may be protected by wearing clothing that has been treated with miticide chemicals. During World War II, methods were developed for treating uniforms with terminal laundry rnse and impregnation with a soap solution containing dimethyl phthalate or dibutyl phthalate and benzyl benzoate.

A satisfactory vaccine for this form of typhus had not been developed by mid-20th century. Attempts to protect man against scrub typhus by immunization with inactive vaccines had given uniformly discouraging results under the conditions of field exposure. It had become possible to provide immunity by inducing a subclinical infection with an attenuated strain of *R. tsutsugamushi* and suppressing the overt disease by chemoprophylaxis. This method, however, was cumbersome.

(K. F. M.)

TYPOGRAPHER is a derivation of the word typography and means "a printer" The term has recently been revived and is used by those engaged in designing books of an exclusive character, such as those printed at private presses, where a specially designed type may be employed for some specific work. It is also sometimes adopted by "layout hands" employed in advertising departments where booklets and other advertisement matter is prepared and sent to the printer to produce.

TYPOGRAPHY is the art of printing (*See* also the articles PRINTING, PRINTING TYPE and CALLIGRAPHY) It has as its first object not ornament, but utility. The printer must never distract, even with beauty, the reader from his text. In the printing of books there is less room for individuality of style than in the typography of propaganda. The laws of typography in books intended for general circulation are based upon (a) the essential nature of alphabetical writing; (b) the force of tradition. But strict as the conventions are, there is not, and can never be, a rigid character of typography applicable to all books produced in a given geographic or ethnic area; or a universal formula acceptable to all books printed in Roman types. The strength of tradition expresses itself in the details of book arrangement and these vary widely. Certain laws of linear composition are, however, obeyed by all printers who use the Roman letter.

A fount of Roman type consists of (1) Roman: CAPITALS, SMALL CAPITALS, lower case, : . " ; 1 2 3 4 5 etc (), and (2) *Italic: CAPITALS, lower case.* In addition to these, as necessary adjuncts, the printer possesses (3) spaces; (4) leads, (5) straight lines of metal known as *rules,* and (6) a collection of mobile ornaments, head- and tail-pieces, flowers, decorated initial letters, vignettes and flourishes, wood blocks of borders, etc. Another decorative medium at his command lies in his use of (7) colour (red being the most widely used). For emphasis he possesses (8) special types of notably heavy face, and may use colour for the same purpose. (9) Space is another valuable element, margins, blanks, etc. being filled in with what are known as "quotations." Finally (10) there is the nature (colour, weight and texture) of the paper.

Composition is the selection and arrangement of all these elements; *Imposition* is the due placing of the composition upon the sheet; *Printing* comprises the press-work, securing a perfection of register (backing up), the quality and crispness of inking. Typography, therefore, controls composition, imposition and paper. The paper (*q.v.*) must be of a character capable of expressing the value of the composition. The margins must be proportionate to the area of the text, allowing convenient space for thumbs and fingers at the side and bottom of the page. The mediaeval margins as adopted by the Kelmscott Press, are handsome and agreeable in certain books, but, are neither agreeable nor convenient in other books, *e g.*, where the page dimension is necessarily small or narrow, and the book is to be carried in the pocket. For this and other books, the type may well be centered on the measure of the page, and slightly raised above ocular centre.

Composition.—The fundamental principles of page-composition are deducible from the ocular facts of alphabetical printing in the Roman letter. The eye cannot, with ease, read pages of words composed of letters designed with sharply contrasting thicks and thins. Nor can the eye agreeably read a mass of words composed even In a rightly constructed letter, unless the line is kept to a certain maximum length; that is to say, the reader's eye cannot comfortably seize more than a certain number of words in any given size except in a proportionate length of line. Nor can a reader comfortably seize a letter, a word or a line, unless the printer's setting is related to the reader's normal habit of vision when holding a book for reading. The typographer's respect for these principles will generally protect the reader from the risk of "doubling" (that is, reading the same line twice), or from being given a book in a large and "staring" type.

The average number of words which the reader's eye can conveniently seize is between 10 and 12 (some 48 characters). The typographer, while exerting himself to the utmost to respect this ocular limitation, may often be confronted with certain conditions

which make it impossible for him to secure a type of the right related size He is often forced to the use of a small type, and in order to obviate the risk of "doubling," he inserts leads between the lines of type and thus increases the space between them.

The practice of leading, denounced in certain quarters, is an essential necessity. The typographer, therefore, in making the best use of his material, must make legitimate use of leads It may be added, too, that in certain compositions, leads produce a happy effect; and in not a few cases, their absence may ruin a composition set even in a relatively large type.

The typographer should know how to extract the utmost from the use of a type which is narrow in relation to its height—leading and spacing play a decisive part here. A round, open, wide letter may, for certain purposes, be set "loose"; *i.e.*, the space between the letters will be greater (or appear greater by reason of the curves of the c, o, e, g, in the lower case), than in a relatively condensed letter. Consistency will here insert a satisfactory lead between the lines.

The space between words composed in a condensed letter is less than that between words in a round, wide form. A lead should always precede and follow quoted matter. Where there is no leading between the lines, and the composition is necessarily tight, it may be an advantage to set leads between the paragraphs.

Indention is a most important detail. The opening sentence of every work should automatically manifest itself as such. This may be contrived by using a large initial letter, by printing the first word in CAPITALS, or SMALL CAPITALS, or CAPITALS and SMALL CAPITALS. The first word may be set into the margin, but it should *not* be indented Indention marks paragraphs—the subsequent sections of the text. Where for any reason it may be necessary to avoid indention in paragraphs, a lead is plainly desirable. Absence of indention and of lead means the virtual extinction of the paragraph.

The depth of the page will be related to the length of line. The measure must be symmetrical, displaying a form pleasing to the eye. A rectangle is more pleasing than a square

A rectangular page composed of lines of 10–11–12 words long will generally be satisfactory. It remains to add the running page-heading, and the folio. The page-heading may either range to the left and right in the opening (fixing the two pages as a unity); or range to the right and left; or it may be centred. The folio may be centred at the foot, or range either way at the top or bottom; but it cannot be centred at the top without abolishing the running page headline. This may be done, but it is an undesirable practice. The running headlines may be set in capitals of the text, in upper- and lower-case of the text, or in any combination of capitals. The use of full-sized capitals renders over-conspicuous a repetitive feature inserted for extrinsic convenience—that is, the identification of loose leaves. By reason of its position, the headline looks ragged if set in upper- and lower-case. It seems best, therefore, to employ small capitals; all capitals are best separated by hair spaces as their rectangular structure and preponderance of perpendiculars tend to solidify the composition.

Full-sized capitals may well be used for chapter headings, the number of the chapter being kept in small capitals, and both indications being hair spaced. The practice of dropping the chapter opening is justified by the fact that the eye, in travelling from the generally occasional blank at the end of a chapter to the beginning of the next, finds a companion blank an agreeable consistency It has also the psychological advantage of saving the reader from feeling overpowered by the text. The rectangle of type is so imposed upon the edge as to allow centre, head, fore-edge and tail margins of a dimension proportionate, first, to the length of line and, secondly, to the disposition of space at points where the text is cut into chapters, and where the body joins the prefatory and other pages known as "preliminaries." These last, less strictly governed by convention than the text pages, offer the maximum opportunity of design to be found in the volume.

The history of printing is in large measure the history of the title-page. The title when fully developed occupied a recto page, either partially or wholly; and the title-phrase, or a catchword of it, has generally been set in a conspicuous size of type. Sixteenth century Italian printers generally used large capitals, copied from inscriptions, or more exceptionally, from caroline manuscripts; while English use followed the French in employing a leading line of large upper- and lower-case, followed by a few lines of pica capitals. Next came the printer's device, and at the foot of the page, his name and address. The large sizes of upper- and lower-case, being an inheritance from printers who were accustomed to black-letter (never set in solid capitals), have gone The device also has vanished, except from the University Presses.

The contemporary title-page is a bleak affair; in nine out of ten cases the blank between the title and the imprint of the printer-publisher tends to be the most outstanding feature. When the device was first abandoned, the author, printer or publisher took advantage of the leisure of the reader and the blank at their disposal to draft a tediously long title, sub-title and indications of the author's qualifications, designed to fill the entire page. The present day publisher goes to the other extreme, reducing the title to as few short words as possible, followed with "by" and the author's name. A professional writer may insert, *e.g.*, "Author of *The Deluge*" under his name, but three and sometimes four inches of space separate this from the first line of the imprint. Consequently unless the title be deliberately set in a size of type out of all relation to that of the remainder of the book, this space is over-conspicuous. It is clear that a volume in 12-point does not require a 48-point title unless it be a 300-page folio in double-column.

Care for the typography of a book means care for its unity. There is no reason for a title-page to bear any line in a type larger than twice the size of the text-letter. If the book be set in 12-point, the title need be no larger than 24-point—or even slightly smaller. It should be set in spaced capitals as a rule The author's name, like all displayed proper names, should also be in capitals The headings to the preface, table of contents, introduction, etc., should be in the same size and fount as the chapter heads; and should be dropped if they are dropped The order of these pages remains unsettled, except that all begin on a recto page. The logical order of the preliminary pages is half-title, title, dedication, contents, introduction, preface. This rule is applicable to most categories of books. Novels need neither table of contents nor list of chapters, though one or the other is generally printed. If it is decided to retain either, it would be reasonable to print it on the back of the half-title and facing the title page, so that the entire nature of the book will be indicated to the reader at a single opening. Where the volume is made up of a few short stories, their titles can be listed in the blank centre of the title-page

Book Sizes.—In addition to fiction, belles-lettres and educational books are habitually published in portable, if not in pocketable formats, crown octavo $7\frac{1}{2}''\times5''$ (in America known as 12 mo) being an invariable rule for English novels published as such. The novel in the form of biography will be published as a biography, $6''\times8\frac{1}{4}''$, the size also for history, archaeology, science, art and almost everything but fiction. Novels are only promoted to this format when they have become "standard." Size, therefore, is the most manifest difference between books.

Another obvious difference is bulk, calculated in accordance with the publisher's notion, first, of the general sense of trade expectation, and, secondly, of the purchasing psychology of a public habituated to certain selling prices vaguely related to number of pages and thickness of the proffered volume. Inconsistently enough, weight does not enter into these expectations. These habits of mind affect the choice of fount and size of type, and may necessitate the adoption of devices for "driving out," *i.e.*, making the setting take up as much room as possible. By putting the running headline between rules or rows of ornaments; introducing unnecessary blanks between chapters; contracting the measure; exaggerating the spaces between the words and the lines; excessively indenting paragraphs; isolating quoted matter with picas of white space; inserting wholly unnecessary sectional titles in the text and surrounding them with space; contriving to drive a chapter ending to the top of a recto page so that the rest of it and its verso may be blank; using thick but not heavy paper; in-

creasing the depth of chapter beginnings and inserting very large capitals thereto, the volume can be inflated to an extra 16 pages —a feat which the able typographer accomplishes without showing his hand to the reader.

Limited editions of standard authors, or of authors who desire to rank as such, are commonly given a rubricated title. Under no circumstances, however, should red appear anywhere else in the work. Hand-made paper is generally used for editions-de-luxe, and none but the brave among typographers will disregard the superstitious love of the book-buying classes for its untrimmed, ugly and dirt-gathering rough edges There is another category of limited edition produced by typographers working freely, without the handicap of trade conditions. These books are rapidly increasing in number, and use a wide variety of format, of type, of illustration and of binding.

Because, rather than in spite of, mechanical methods and standardization, printing is more various to-day than ever before Whereas English books of whatever category of 20 years ago were printed in only three designs of type, no fewer than eight founts are employed to-day It has been necessary that most of these are reproductions of classic old-faces, but it may well be that the near future will witness a real renaissance of type design based upon a sensitiveness to rightly-controlled type forms, and not animated by an uninformed curiosity for the original and the bizarre. (S Mo)

TYPOLOGY. Typology results from a study of the various kinds of objects fashioned by man and the sorting of them into categories. The objects in each category can be often further classified, a geographical, chronological or evolutionary basis being taken. For example, in the case of artefacts made by primitive man in the Fiji Islands the typologist might begin by sorting out all the paddles These would then be further classified according to their locality and age On studying such a group of objects it is often possible to make out an evolutionary series in a tool family, a certain type being clearly derived from an earlier one and itself the parent of some further development

In prehistory, a typological study of the artefacts made by man is one of the four methods which yield information before written documents existed; the other three being stratigraphy (*q v*), a study of the state of preservation of the artefacts found, and of the objects associated with them The two latter methods are useful as checks on the information obtained from stratigraphy and typology.

Although as shown above typology sometimes enables us to determine a chronological sequence, this is primarily obtained by the stratigraphical method; typology enables us to study systematically the industries belonging to the various cultures By noting the peculiarities of the various tools which make up the industries we obtain type standards for each culture with which new finds, otherwise undatable, can be compared. Thus, it is found by experience that a particular implement, viz., the beaked burin, is almost exclusively confined to industries which on stratigraphical and other grounds, can be assigned to a Middle Aurignacian culture If then a new industry is discovered otherwise undatable, but including a large number of beaked burins, we can assume, with some probability, that the age is Middle Aurignacian Again, a certain type of celt, showing a rectangular cross-section and elaborate trimming, can at once be recognized not only as being of Scandinavian origin, but also as belonging to a definite period of late Neolithic date.

Typology can be applied to styles and techniques of painting. Thus, for example, in Southern Rhodesia palimpsests of Bushman paintings occur. The typologist can observe several different styles which are always found occurring in the same stratigraphical sequence, painted one over the other. In this way a succession of art styles has been determined (M. C. B)

TÝR, the Scandinavian god of battle, was not such a prominent figure in Northern mythology as among other Teutonic peoples. In Anglo-Saxon he was called Tī (*Tīw, Tiw*, gen *Tīwes*, whence "Tuesday") and equated with the Roman Mars. His Teutonic name is the same as the word for "god" in several Indo-European languages, *e g*, Lat. *dīuus*, Lith. *dēvas*, Skr. *devas;* even in Old Norse the plural (*Týar*) was still used in the same sense. (*See* TEUTONIC PEOPLES· RELIGION.)

TYRANNOSAURUS: *see* DINOSAURIA

TYRANT, a term applied in modern times to a ruler of a cruel and oppressive character (Gr. *τύραννος*). This use is based on a misapprehension of the Greek word, which implied nothing more than unconstitutional sovereignty. Such rulers are not confined to a single period, the 7th and 6th centuries B C. (the so-called "Age of the Tyrants" [*see* GREECE· *History*]), but appear sporadically at all times. The use of the term "tyrant" in the bad sense is due largely to the ultra-constitutionalists of the 4th century in Athens, to whom the democracy of Pericles was the ideal of government Thus the government which *Lysander* set up in Athens at the close of the Peloponnesian War is called that of the "Thirty Tyrants" (*see* CRITIAS).

TYRAS, a colony of Miletus, founded about 600 B C., some 10 m from the mouth of the Tyras (Dniester). The types of its coins suggest trade in wheat, wine and fish During the 2nd century B C. it fell under the dominion of native kings It was destroyed by the Getae about 50 B C. In A D 56 it seems to have been restored by the Romans and henceforth formed part of the province of Lower Moesia Its coins now display heads of emperors from Domitian to Alexander Severus. Soon after the time of the latter it was destroyed by the Goths. Its government was in the hands of five archons, a senate, a popular assembly and a registrar The few inscriptions are mostly concerned with trade. Its remains are scanty, as its site is covered by the mediaeval fortress of Monocastro or Akkerman (*see* CETATEA ALBA)

TYRCONNEL, RICHARD TALBOT, EARL (TITULAR DUKE) OF (1630–1691), Irish Jacobite, son of Sir William Talbot (d 1633), a Roman Catholic lawyer and politician, served as a royalist in the Great Rebellion, and was present at the storming of Drogheda by Cromwell (Sept. 3, 1647), afterwards escaping to Spain He was arrested in London in Nov. 1655 for acting as agent in plots to upset the Commonwealth, but escaped once more After the Restoration he was employed in the household of the duke of York (James II) even after his participation in an intrigue to ruin the character of Anne Hyde, the duke's wife. In 1678 he was arrested in connection with the Popish plot agitation, and went into exile for a time During the reign of James he was appointed commander-in-chief in Ireland and created earl of Tyrconnel (1685); in Feb 1687 he was appointed lord deputy. Tyrconnel, who foresaw the revolution in England, intrigued for the handing over of Ireland to France, in the interests of the Roman Catholics, and in 1688, when James fled to France after the battle of the Boyne, Tyrconnel was left to carry on the struggle against William III. When the latter raised the siege of Limerick Tyrconnel fled to France for help On his return to Ireland, in Jan. 1691, he was of little use, and was compelled to retire to Limerick, where he died on Aug 14, 1691. In 1689 James created him duke of Tyrconnel, but the title was only recognized by the Jacobites

TYRCONNELL (*Tir-Conaill*), an ancient kingdom of Ireland. Conall Gulban, a son of Niall of the Nine Hostages, king of Ireland, acquired the wild territory in the north-west of Ulster (the modern Co. Donegal, etc.), and founded the kingdom about the middle of the 5th century. Of the several branches of his family, the O'Connells, O'Cannanans and O'Dohertys may be mentioned. The kings of Tyrconnell reigned until 1071.

TYRE, a famous seaport of Phoenicia, now in the State of Great Lebanon, in French mandated territory (mod. *Sur*); pop., 5,700. Tyre is built on a peninsula, formerly an island, has nar-

row streets and evident traces of antiquity in the material of its buildings. Of the two harbours which it formerly possessed, the northern, or Sidonian, still survives; the southern, or Egyptian, has disappeared. Once the great mart of the Mediterranean world, it has now an insignificant export trade in cotton and tobacco. It has a French garrison and a French adviser

History.—The name Usu (Ushu), the designation of the mainland town, appears in the Tell el Amarna letters (14th century B.C.), and in Papyrus Anastasi I (13th century). As it is not found in the list of Syrian cities tributary to Thutmoise III. (15th century B.C.), it is reasonable to conclude that it was founded before the beginning of the 14th century, but not before the beginning of the 15th. The earliest settlement, a colony of Sidon (*q.v.*), was in all probability divided between the mainland and the island. The building of a causeway connecting the island with the shore is attributed to Hiram, well known as the king of Tyre, who had commercial dealings with Solomon and supplied skilled labour and material for the erection of the temple at Jerusalem. Jezebel was a daughter of Ethbaal, a Tyrian king

From her island fortress, Tyre, the mistress of the seas, could defy her enemies and for the most part Assyrian and Babylonian might spent itself against her defences in vain Shalmaneser IV., after an unsuccessful attack by sea, maintained a blockade on the land side for five years until his death intervened. Ashurbanipal stormed the city in 664 B.C. In the 6th century B.C. it endured a 13 years siege from Nebuchadrezzar

However, Tyre, with the marvellous vitality of those early times, recovered in a comparatively short time. The city passed under the sway of the Seleucids (198 B.C.) and the Romans (68 B.C.). Herod the Great endowed it with a temple. St Paul spent a week there while the ship "unloaded her burden" on his journey from Ephesus to Jerusalem By the 2nd century it had become the see of a bishop. With the rest of Syria it passed into the hands of the Muslims in the 7th century The crusaders captured it (1124), and made it one of the chief cities of their kingdom of Jerusalem. After the fall of Acre, the Muslims destroyed it.

In Roman times Tyre, "seething with commerce" (*ebulliens negotiis*) was famous for the manufacture of silk and silken garments, as well as the famous Tyrian purple from the murex shell Lucan (*Phars* x. 41) tells how Cleopatra appeared at a banquet arrayed in thin-spun and clinging silk garments, made by the skilful Tyrians and then a new luxury

A French archaeological expedition visited Tyre in 1921 and explored the neighbourhood. *See* PHOENICIA.

See Mme D. le Lasseur, "Mission archéologique à Tyr" (1921); *Syria* 3 (1922); R. Dussand, *Topographie Historique de la Syrie Antique et Médiévale* (1927), 19 *seq.* (bibl). (E. R.O.)

The most important references to Tyre in the Bible are 1 Kings v., vii., ix., Is. xxiii; Am. i. 9 *seq.*; Ezek. xxvi–xxviii.; 2 Macc iv. 18 *sqq*: Mark iii 8, vii. 24 *sqq*; Matt. xi. 21 *seq.* (and parallels); Acts xii. 20 *Cf.* also Joshua xix. 29; 2 Sam. xxiv. 7; Ezra iii. 7; Neh. xiii. 16; Ps. xiv. 12, lxxxiii. 7, lxxxvii. 4.

Siege of, by Alexander the Great (332 B.C.).—After the battle of Issus, Alexander, as he marched southwards towards Egypt, called upon the Phoenician cities to open their gates, as it was part of his general plan to deny their use to the Persian fleet. The citizens of Tyre, who owed allegiance to the king of Persia, refused to do so, whereupon he laid siege to the city. New Tyre was built on a small island, about half a mile from the main land upon which the old city stood Possessing no fleet Alexander demolished old Tyre, and with the *débris* built a mole 200ft in breadth across the straits, and erected towers and war engines at its further end. Thereupon the Tyrians destroyed the towers by fire ships and damaged the mole. Many curious devices were made use of to defeat the Greeks, such as pots of burning naphtha and sulphur, and red-hot sand hurled from catapults. Alexander next widened the mole and rebuilt the towers, but he saw that without assistance of a fleet success could not be assured since the Tyrians had free access to the sea. From Sidon he obtained 80 Phoenician ships, and 24 from Rhodes, Mallus, Soli, Lycia and Macedonia Then the king of Cyprus, hearing of the defeat of Darius at Issus, joined Alexander with 220 warships. The reduction of Tyre was now but a matter of time, for if the assault from the mole proved unsuccessful, starvation must accomplish its work Alexander was, however, impatient to complete the siege before Darius could raise another army, so he constructed floating batteries upon which rams were mounted, and forced his way into the Egyptian and Sidonian harbours, and scaled the city walls. Thus after a siege of seven months the city was taken, 8,000 of the citizens were slaughtered, 2,000 later on executed, and 30,000 sold into slavery.

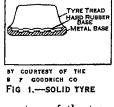
See Arrian, *Anabasis of Alexander*, Diodorus Siculus; G. Grote, *History of Greece* (1906), *The Cambridge Ancient History*, vol. VI. (1927). (J. F. C. F.)

TYRE. The tyre of a wheel is the outer circumference portion that rolls on the ground or on a track prepared for it. Railway vehicle wheels usually have hard steel tyres, which together with the hard steel rail give the maximum endurance and the minimum rolling resistance. The common tyre made for the exterior rim of non-motor road-vehicles serves to hold together the parts of the wheel and resists wear in travelling. It is ordinarily made of iron or steel, and consists of a flat hoop formed so as to fit tightly over the exterior of the wheel Its chief considerations are strength and durability. In bicycles, motor cars, and other road-vehicles in which freedom from vibration and shock is also desired, solid or pneumatic rubber tyres are employed.

The principle of the pneumatic tyre was patented by Robert William Thompson in England in 1845, in France the following year and in 1847 in the United States Thompson's patent substantially covers the tyre as it is known to-day. It showed a non-stretchable outer cover and an inner tube of rubber to hold air An early set of tyres made on this basis covered 1,200 miles when placed on an English brougham.

Almost half a century late, when the bicycle became popular, pneumatic tyres were revived by John Boyd Dunlop of Belfast, Ireland. He obtained certain patents in 1888 and 1889 on English bicycle tyres. A year after Dunlop's patents were issued, Charles K. Welch patented a tyre shoe of fabric having wire edges and a rim to clinch the shoe and hold it to the felloe of the wheel In 1892 a United States patent for a similar tyre was granted to A. T. Brown and G. F. Stillman. This was purchased by the Dunlop Company and these clincher tyres were manufactured in its American factory and, under licence, by the Diamond Rubber Company. In 1890, the first clincher tyre held in position by inwardly-curved flanges of the wheel rim was patented by William Erskine Bartlett, an American residing in England, and in 1892 another by Thomas B Jeffery in the United States Both of these were pronounced valid by the courts The thread or cord tyre was patented by John Fullerton Palmer in England and in the United States in 1893. Pneumatic tyres were first applied to motor-vehicles by a firm of French rubber manufacturers, Michelin and Company. After some improvements were made, rubber tyres were adopted by Panhard and Levassor and other French automobile manufacturers about 1895 The first tyres used in America on commercial motor-vehicles were made by the B. F. Goodrich Company in 1896 for Winton cars manufactured in Cleveland. These were single tube tyres.

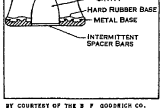
RUBBER TYRE MANUFACTURE



Rubber tyres may be considered in two classes—

(a) Solid or cushion tyres being those in which the rubber portion fulfils the combined functions of carrying the load, absorbing the shocks of meeting road surface irregularities, and resisting abrasion.

(b) Pneumatic tyres—in which the load is carried and the shocks absorbed mainly by compressed air. The structure of the pneumatic tyre is primarily designed to provide a non-extensible covering with impermeable lining to contain and restrain under compression the column of air. This covering is provided with a rubber tread portion which takes up the abrasive wear of road contact and protects the contained column of compressed air Such a structure has, as distinct from a solid rubber or cushion tyre, no capacity in itself either to carry load or to absorb shocks. It is entirely dependent on the contained compressed air



to enable it to function, and is therefore correctly named a "pneumatic" tyre

Solid Tyres, although at some time used for all types of road vehicles and for the earliest motor cars, have now practically disappeared from American highways because of legislation which discouraged their use. Large sizes have been supplanted by large pneumatic tyres, but small solid tyres are still used extensively on industrial trucks and tractors. Some of these are made with metal base bands to which the rubber is firmly attached. These bands are the full width of the base of the tyre and are dovetailed to secure firm anchorage of a hard rubber layer interposed between the metal and the soft rubber constituting the main portion of the tyre. This type of tyre is forced over the periphery of the wheel in an hydraulic press and remains fixed for the period of its life In other cases the tyre is vulcanized directly to the rim of a metal wheel instead of to a separate band.

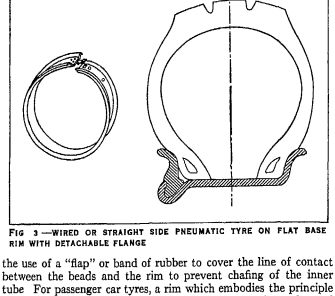
FIG 1.—SOLID TYRE

Cushion Tyres.—This title is somewhat loosely applied to a number of variations of the solid tyre which are designed to provide greater deflection under load and increased cushioning against shocks. These objectives are attained by the use of softer rubber compounds and by insertion of cavities in the tyre. The cavities may be circumferential grooves in the centre of the tyre, indentations in the sides or holes extending through the rubber transversely. Such modifications reduce the volume of rubber and hence the load carrying capacity. Both solid and cushion tyres are still used on military vehicles.

BY COURTESY OF THE B F GOODRICH CO.
FIG. 2. — SEMI-CUSHION SOLID TYRE

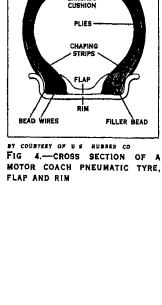


Pneumatic Tyres.—Whilst Thompson (Patent No. 10990 of 1845) was the first to conceive the possibility of supporting a road vehicle on a contained column of compressed air, and did in fact equip a horse-drawn brougham with 5-in. air-inflated tyres, it was to J. B. Dunlop (Patent No. 10607 of 1888) that the introduction of the pneumatic tyre must be credited; for from the production of his first crude inflated tyres at Belfast in 1888, the manufacture of pneumatic tyres has continued without break, with constant improvement in the product, until to-day it is essential to all high speed road motor transport, and has remained since its introduction the only equipment of cycles of all forms.

The simplest form of pneumatic tyre is that known as the single-tube tyre It consists of an endless tube of rubber-coated cotton fabric having on its inner face an impermeable rubber lining, and on its outer surface a covering of rubber to protect the fabric from wet or damage, with an additional thickness of rubber on the tread portion to resist road wear. Single-tube tyres were used on bicycles in America for many years; but because of the difficulty of repairing them they are no longer manufactured They never had any considerable use as equipment for motor cars.

The necessity for a ready means of repairing resulted in tyres taking the form of a separate inflatable inner tube, with a detachable outer cover. Out of a multitude of types of detachable covers introduced in the early '90s, two emerged—the *Wired On* or *Straight Side* type and the *Beaded Edge* or *Clincher* type.

The wired on type quickly secured a dominating position in respect to cycle tyres, but clincher tyres were used extensively for some years on motor cars. This beaded edge was entirely dropped for original equipment by American manufacturers of motor cars in 1923



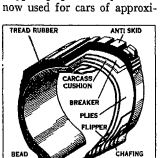
With the standardization of all tyres to one type, the design of rims has undergone some change. In America the straight side rim of the flat base type has been most commonly used for trucks and motor coaches. Its construction varies principally in the method of mounting the tyre and in attaching the rim to the wheel. Some of these rims are made with a loose flange of a self-locking type; some have two loose flanges with a separate locking ring; and there is also the transversely split type. They all require

FIG 3.—WIRED OR STRAIGHT SIDE PNEUMATIC TYRE ON FLAT BASE RIM WITH DETACHABLE FLANGE

the use of a "flap" or band of rubber to cover the line of contact between the beads and the rim to prevent chafing of the inner tube For passenger car tyres, a rim which embodies the principle of the Welch tyre of 1890, and which has been continuously used for cycle tyres and known as the well base or drop centre rim, has now been universally adopted for motor cars both in England and in America These drop centre rims enable the tyres to be very readily and easily mounted and dismounted The method is well known to all motorists and may be briefly described as depressing the endless wired edge of the tyre into the well of the rim at one point in its circumference thus allowing the wired edge of the tyre to be lifted over the edge of the rim at the opposite point of its circumference.

Cord and Canvas Tyres.—The bodies of pneumatic tyres are now made universally of parallel, cabled cords without cross-threads or with only enough light filler yarns to hold the cords in the form of a sheet to facilitate shipment to the manufacturer and handling during application of the rubber. This form of fabric reinforcement has replaced the square woven fabrics of earlier days in which warp and filling were substantially equal in size and strength. The cords are usually made of cotton, although other materials, notably rayon and steel, have recently been adopted for certain kinds of service.

High Pressure and Low Pressure (or Balloon) Tyres—When motor tyres were being almost exclusively made of square woven cotton fabric, the dimensions of the various sizes of tyres required for carrying certain loads had become fairly well stabilized, and equally the inflation pressures necessary for each size of tyre had also been uniformly accepted.



BY COURTESY OF U S RUBBER CO
FIG 4.—CROSS SECTION OF A MOTOR COACH PNEUMATIC TYRE, FLAP AND RIM

The superiority of the cord type, due partly to the cord construction and partly to its increased sectional dimensions led to further developments in which the sectional sizes of tyres were still further increased; and, since the larger the section of the tyre employed to carry a given load the lower the inflation pressure necessary to support the load,

these larger tyres could be made with considerably thinner retaining casings because of the lower inflation pressure which they had to withstand.

Such larger tyres quickly received the name of *balloon* tyres—a title naturally suggesting itself to an observer struck by the enlarged dimensions The name *balloon* quickly became very generally applied to all tyres of larger sectional dimensions, employing lower pressures.

The balloon motor tyre has demonstrated its superior cushioning properties to motorists generally, and to-day low pressure tyres are the standard equipment of all passenger cars With larger sectional dimensions, smaller rim diameters have been required Changes in dimensions and air pressures may be illustrated by comparing the data for 30″x3½″ high pressure tyres with those for 6 00″x16″ balloon tyres, now used for cars of approximately the same weight. Instead of 23″ diameter rims and 50lb pressure the newer type calls for 16″ rims and about 28lb. pressure

FIG. 5.—STEP-DOWN SECTION OF A BALLOON PASSENGER CAR TYRE

The designation of tyre size indicates the type of tyre. For example, 32″x6″ refers to a high pressure tyre of section 6″ in diameter and of 32″ maximum *tyre* diameter (*i.e.* 20″ rim), whereas 6 00″x16″ indicates a balloon tyre of approximately 6″ cross section width and of 16″ *rim* diameter (*i.e.* 28″ maximum tyre diameter).

In order to increase stability against side sway the width of rims has been increased. To-day 6-00″x16″ tyres are mounted on rims measuring 4″ between flanges instead of 2⅝″, the width of the rims for the high pressure tyres which they superseded As already stated, all passenger car tyres are now mounted on drop-centre rims. In order to facilitate mounting and demounting of the tyres and to obtain snug fit to the rims the shape of rims and beads has been changed from a horizontal seat to a bevel as shown in fig. 6

All rims and tyre dimensions and their designations are regulated in the United States by the Tire and Rim Association, an organization composed of representatives of tyre and rim manufacturers. This body co-operates with similar groups in other countries with a view to establishing international standards for tyre and rim dimensions.

Briefly, the construction of a pneumatic tyre can be summarized as consisting in—first, the preparation of the cord material, which is now a specialized operation on which many of the largest cotton mills in the world are exclusively employed The cord, after passing from the cotton mills, is first treated in the tyre factory by a coating of rubber applied on a calendering machine to both sides of the sheets of cord fabric. These rubberized sheets are then cut into bias strips of suitable widths and brought to building machines on which the casing is built up, and the wire rings which retain the finished tyre upon the rim are enclosed within the edges of the casing. Various parts of fabric and rubber are added in the form of chafing strips, filler strips, rubber insulation plies, and cotton breaker strips, and finally the tread and sidewall coverings are added. Early practice of building this structure over a core of approximately the finished shape of the tyre has been generally discontinued Tyres are now built in the form of wide, flat endless bands which, before vulcanization, are subjected to a shaping process either by producing a vacuum outside the band in a forming box or by applying pressure against the inner surface of the band. The tyres thus formed are mounted on expansible rubber bags and placed in steel moulds for vulcanization. For many years it was common practice to stack the moulds containing the tyres one above another on an hydraulic ram inside a vertical cylindrical steam pressure vessel After the cover of the vessel was closed the ram was raised, forcing the halves of the moulds tightly together around the tyres, and heat was supplied by steam outside the moulds while the bags inside the tyres were expanded with air, steam, or hot water or combinations of them. Hot water or steam furnished heat from the inside in addition to that supplied by the steam surrounding the moulds. When air was used all heating was from the outside, and if there was any leakage of air to the outside of the moulds through the connections to the bags the rate of heat transfer was greatly reduced The use of steam or water avoided the dangers of variability in vulcanization inherent to the use of air. In modern practice the tyres and their enclosed bags are each placed in individual, hinged steam-jacketed moulds (watch-case heaters) With these heaters air from inside the bags cannot, of course, leak into the steam cavity. This process of vulcanization under pressure results in the moulding of the tyre into its finished form, uniting all parts firmly together, and produces within the rubber mass certain reactions between the rubber and the sulphur and other ingredients which have been previously incorporated in the rubber, resulting in a tough and durable product.

BY COURTESY OF THE B F GOODRICH CO
FIG. 6.—PNEUMATIC TYRE ON WELL BASE RIM

Inner Tubes are designed to hold the air inside the tyre casings. The early practice of vulcanizing straight tubes on cylindrical mandrels and afterward splicing their ends together, has now been abandoned in favour of vulcanization in circular, steam-jacketed moulds while the rubber is expanded by air against the mould surface. All tubes are, of course, fitted with non-return valves. Metal valve stems, once universally used, have been largely supplanted by flexible rubber stems with metal inserts Inner tubes are made 15% to 20% smaller in volume than the casings into which they fit. When inflated they expand to fill the inside of the casings.

Self puncture-sealing tubes are now common. One type consists of a structure in which the portion of the tube liable to puncture is under compression so that the rubber presses tightly against the puncturing object. Another type contains inside the rubber wall a layer of plastic material which flows under the internal pressure to surround the penetrating object and to plug the hole if it is withdrawn Neither type is intended to offer permanent sealing but to prevent rapid deflation of the tyre on the highway Another device consists of a double-chambered structure, the two parts connected and inflated to the same pressure. If the outer chamber is punctured the inner one will carry the load safely until the car can be stopped.

FUNCTIONS OF TYRES

Cushioning.—Road impacts are of two kinds, shock and drop. When a tyre strikes an obstacle protruding above the road surface the road and the tyre both experience shocks, designated respectively as shock impact to the road and shock reaction to the vehicle. Studies by the U S. Bureau of Public Roads indicate that shock reactions increase progressively with the speed of the vehicle up to 40 m.p.h. and assume constant value at further increased speeds. If travel over the obstacle raises the axle of the vehicle the tyre, after passing it, drops back into contact with the road, producing what are termed drop impact and reaction. These reach maximum value between 20 and 40 miles per hour Above these speeds the tyre envelops obstacles more completely and drop reactions decrease in magnitude. The fact that pneumatic tyres, especially the low pressure type, are far superior to others in reducing shocks to the road has prompted legislation favouring the use of pneumatic tyres.

Avoidance of Slipping.—Depending on the material and smoothness of road surfaces and on conditions of the weather, the coefficient of friction between tyres and road may range widely,

—from 0·02 to 0·70. Dry surfaces offer high resistance to slippage; whereas wet surfaces, especially immediately after rain begins, are extremely slippery. Non-skid designs are formed on treads during the vulcanization process when the rubber bags inside the tyres expand them against an engraved mould presenting the desired design in reverse. The designs most effective in preventing slipping and skidding on wet, hard surfaces are those which remove water from the highway under the tyre through channels in the tread, permitting the rubber to grip a nearly dry surface. On dirt roads traction and steadiness are enhanced by deformation of the road material as it sinks into depressions in the tyre tread This condition is encountered with farm tractors which are used over ploughed ground Tyres for such equipment are consequently made with sturdy, thick crossbars of rubber To improve traction still further, farm vehicle tyres are weighted either with iron weights applied to the wheels or by almost filling the tyres with a non-freezing water solution of a suitable salt

Reduction of Noise.—Even over smooth pavements some non-skid designs produce objectionable noise and vibration especially if, after some thousands of miles of travel, the tyres are unevenly worn. Intensity of sound caused by tyres has been measured by microphone and radio-receiving instruments and great improvement has been made in eliminating noise from this source Elimination of isolated knobs or buttons, and the use of continuous ribs or of unevenly spaced rectangular blocks to avoid regular vibrations, has been effective in accomplishing this change

Ease of Steering.—Proper design of the cross-sectional contour of tyres, the manner in which the cords are arranged, and the width of rims all affect steering of the vehicle. Properly designed and properly inflated tyres run true without weaving Dynamic balance of tyre and tube assembly must be maintained within certain limits specified by car manufacturers This requirement is designed to prevent uneven tread wear and "shimmy" or "tramp," which were frequently encountered when balloon tyres first came into use.

Long Service.—Aside from the expense of replacement, long uninterrupted service is demanded of tyres to-day for other reasons, particularly when the vehicle is used for commercial purposes Failure to meet appointments or to maintain a bus schedule, and delay in transportation of goods, must be avoided. The quality of modern tyres is remarkably high and failure of tyres properly used is extremely rare

The following figures indicate the economic importance of the rubber tyre industry in the United States

TABLE I

Motor vehicles registered in 1938:	
Passenger Cars	25,261,649
Motor Trucks	4,224,031
Total	29,485,680
Motor Vehicles on Farms in 1938	
Passenger Cars	4,516,508
Trucks	997,127
Total	5,513,635
Rubber Tyre Shipments in 1938:	
High Pressure Casings	2,539,804
Balloon Casings	39,709,268
Solid and Cushion Tyres	373,815
Inner Tubes	40,292,614
Number of Manufacturing Establishments in 1935	42
Number of wage earners in 1935	57,128
Wages in 1935	$ 78,853,000
Value of tyres and tubes produced in 1935	$446,029,000

At one time the useful life of tyres was ordinarily terminated by failure of the fabric in the carcass. To-day, however, carcasses of tyres almost invariably outwear the tread, even though tread life has been improved greatly during the past decade Consequently the practice of retreading or of recapping treads is now economical and many tyres will last until a second tread has been worn through The development of retreading compositions which vulcanize around 260° F has made possible application of new treads on worn tyres without deterioration of the carcass, which would occur at somewhat higher temperatures.

Wheels for many purposes are now fitted with rubber tyres. Not only bicycles and motor road vehicles but railroad cars, industrial trucks and tractors, farm tractors and farm machinery, wheelbarrows, lawn mowers, juvenile vehicles (notably coasters), roller skates, bullock carts, and rickshas are now equipped with rubber tyres Aeroplanes, also, are now normally equipped with low pressure tyres. The cost of pneumatic tyres is low to-day compared with 20 years ago and the quality vastly higher. Consequently, the average number of tyres required per car each year has decreased from about five to less than one and a half. Lower costs of tyres and increased safety and freedom from delays resulting from tyre failure have been important factors in promoting the extensive use of motor cars for pleasure and business purposes.

(W H P., J W. Sc)

TYREE, island of the Inner Hebrides, Argyllshire, Scotland. Pop. (1931) 1,448. It is situated fully 2 mi S W. of Coll, the isle of Gunna lying in the channel between the two islands, and has an extreme length from north-east to south-west of nearly 12 mi. and a breadth varying from ¾ mi. to 4½ mi. Carnan Mor (460 ft) is the highest point; there are several lakes. On the south-western point of Balephuil bay are ruins of St. Patrick's temple, besides duns and chapels; an ancient underground dwelling was found in 1916. Steamers call from Oban regularly at the small harbour of Scarnish. Horses are bred on the island. Marble has been worked. Skerryvore, a lonely rock in the Atlantic, with a lighthouse, 14 mi. south-west, belongs to the parish of Tyree.

TYROL: *see* TIROL.

TYRONE, EARLS OF: *see* O'NEILL (Irish Family).

TYRONE, a county of Northern Ireland, bounded north and west by Donegal, northeast by Londonderry, east by Lough Neagh and Armagh and south by Monaghan and Fermanagh. Its greatest length is 46 mi. and greatest breadth 60 mi. The land area is 1,218 square miles. The population in 1937 was 127,586. Running along the northeastern boundary with Londonderry are the schist ridges of the Sperrin Mountains (Sawel, 2,240 ft., and Meenard, 2,061 ft.). Most of the south of the county is occupied by sandstone formations. Mullaghearn, north-east of Omagh, reaches 1,778 ft. South of Clogher a range of hills, reaching 1,255 ft. in Slieve Beagh (Upper Carboniferous sandstones and shales), forms the boundary between Tyrone and Monaghan.

From Coalisland to Dungannon true Coal Measures appear. This coalfield includes one seam 9 ft. thick at Coalisland; less important coals occur in the Millstone Grit series at Dungannon. The field doubtless continues eastward under the Triassic sandstone that stretches towards Lough Neagh. The pale clays, probably Pliocene, of the southern shore of the lake cover the flat land east of Coalisland, and are several hundred feet thick. North of Stewartstown, near Tullaghoge, a very small patch of Magnesian limestone contains Permian marine fossils; and, farther north, the county includes part of the basaltic plateaus, protecting Chalk, which extend into Co. Londonderry.

The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Newton Stewart. The principal tributaries of the Mourne are the Strule (constituting its upper waters), the Derg from Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater rises near Fivemiletown and forms part of the south-eastern boundary of the county with Monaghan and Armagh. Lough Neagh bounds the county on the east. Lough Fea is situated in the north-west, and there are several small lakes near Newtown Stewart.

Tyrone became a principality of one of the sons of Niall of the Nine Hostages in the 5th century, and from his name—Eoghan—was called Tir Eoghan, gradually altered to Tyrone. From Eoghan were descended the O'Neals or O'Neills and their numerous septs. The family had their chief seat at Dungannon until the reign of Elizabeth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred by Henry VIII. on Conn O'Neill, but on his death, when the earldom should have descended to his heir Matthew, baron of Dungannon, another son, Shane, was pro-

claimed chief with the consent of the people. Shane defied English authority, but his forces were defeated near the river Foyle in 1567, and shortly afterwards he was himself killed Tyrone was one of the counties formed at Sir John Perrot's shiring of the unreformed parts of Ulster; but his work was interrupted by the rising of Hugh O'Neill in 1596 During the insurrection of 1641 Charlemont Fort and Dungannon were captured by Sir Phelim O'Neill, and in 1645 the parliamentary forces under General Munro were defeated by Owen Roe O'Neill at Benburb. At the Revolution the county was for a long time in the possession of the forces of James II.

Raths are numerous in the county. There is a large cromlech near Newtown Stewart and a horned cairn of three chambers at Clady Halliday. The county contains numerous stone circles averaging 30 to 50 ft. in diameter, being the focus of those of the second class. There are some ruins of the ancient castle of the O'Neills, near Benburb; mention may also be made of the ruins of the castles of Newtown Stewart, Dungannon, Strabane and Ballygawley. The hill pastures support a large number of young cattle. Oats, potatoes and turnips are the principal crops. The cultivation of flax, formerly an important industry, has greatly deteriorated Poultry-keeping is a growing industry. There are manufactures of linens and coarse woollens (including blankets); brown earthenware, chemicals, whiskey, soap and candles are also made. There are a few breweries and distilleries.

Branches of the Great Northern railway from Portadown (Co. Armagh) and Dungannon in the south-east, and from Enniskillen (Co. Fermanagh) and Fintona, unite at Omagh, whence a line proceeds north by Newtown Stewart and Strabane to Londonderry. From Dungannon a branch runs north to Cookstown, where it joins a branch of the Northern Counties (L.M.S) railway.

Water communication includes Lough Neagh, and the Blackwater entering it, and navigable to Moy, whence the Ulster canal skirts the boundary of the county with Co. Armagh to Caledon. Tyrone contains four urban and six rural districts, and there are seven Poor Law unions. The county returns five members to the parliament of Northern Ireland and, along with County Fermanagh, two members to the United Kingdom parliament.

TYRONE, a borough of Blair county, Pennsylvania, U.S A., 15 mi N.E. of Altoona, on the Little Juniata river and Federal highways 220 and 322; served by the Pennsylvania railroad. Pop. (1950) 8,214, 1940 federal census 8,845. The borough is 910 ft above sea level, in an agricultural district, with deposits of limestone, iron and zinc. It is a distributing point for coal from the Clearfield region and manufactures rivets, chemicals, clothing and paper. The village was incorporated in 1857.

TYRRELL, GEORGE (1861–1909), Irish divine, was born in Dublin on Feb. 6, 1861. He was educated under Dr. Benson at Rathmines School and entered Trinity College in 1878. He was greatly influenced by the writings of Cardinal Newman, and early in 1879 entered the Roman Catholic Church. In 1880 he joined the Society of Jesus and became teacher of philosophy at Stonyhurst. He had a keen sympathy with the difficulties experienced by the ordinary lay mind in trying to reconcile the conservative element in Catholicism with the principle of development and growth, and in *The Faith of the Millions, Hard Sayings* and *Nova et vetera* he attempted to clear them away. Tyrrell privately circulated among his friends writings in which he drew a clear line of distinction between religion as a life and theology as the incomplete interpretation of that life. One of these, the *Letter to a Professor of Anthropology*, was translated without his knowledge into Italian, and extracts from it were published in the *Corriere della Sera* of Milan in Jan. 1906. For at least eight years before this he had been more or less in conflict with the authorities of his order, through his sympathy with "modernist" views, but the publication of this letter (afterwards issued by Tyrrell as *A Much Abused Letter*) brought about his expulsion from the order in Feb. 1906. "The conflict," he wrote, "such as it is, is one of opinion and tendencies, not of persons; it is the result of mental and moral necessities created by the antitheses with which the Church is wrestling in this period of transition." Tyrrell found no bishop to give him an ecclesiastical status and a *celebret*, and he never regained these privileges In July 1907 the Holy Office published its decree condemning certain modernist propositions, and in September the pope issued his encyclical *Pascendi Gregis*. Tyrrell's criticism of this document appeared in *The Times* on Sept 30 and Oct. 1, and led to his virtual excommunication from the Church. On July 6, 1909, he was suddenly taken ill, on the 10th he received conditional absolution from a priest of the diocese of Southwark, and on the 12th extreme unction from the prior of Storrington. His intimate friend, the Abbé Brémond, gave him absolution, being with him at his death on July 15, 1909.

His works include: *Lex Orandi* (1903); *Lex Credendis* (1906); *Through Scylla and Charybdis* (1907); *Mediaevalism* (1908); and *Christianity at the Cross Roads* (1909).

See the estimates by Baron F. von Hügel and Rev. C. E. Osborne in *The Hibbert Journal* for Jan 1910; also the obituary in *The Times* (July 16, 1909), and the *Life*, by M. D Petre.

TYRRELL, SIR JAMES (d. 1502), the supposed murderer of the English king Edward V., and of his brother Richard, duke of York, was a son of William Tyrrell and a grandson of Sir John Tyrrell (*d. c.* 1437), who was treasurer of the royal household and was on three occasions Speaker of the House of Commons. The family is said to descend from Walter Tirel, the murderer of William Rufus During the Wars of the Roses James Tyrrell fought for the Yorkists; in 1471 he was knighted; and in 1477 he was member of parliament for Cornwall. With regard to his share in the murder of the prince in 1483 he appears to have been selected by Richard III. and sent to the Tower of London, where he supervised the crime which was carried out by his subordinates. Afterwards he received several appointments from Richard and was sent to Flanders. He was also employed by Henry VII and was made governor of Guisnes, but he seems to have incurred the king's displeasure through his friendship with Edmund de la Pole, earl of Suffolk. Having been treacherously seized he was conveyed to England and was executed on the 6th of May 1502 Just before his death he made a confession about the murder of the princes.

TYRTAEUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B C According to the older tradition he was a native of the Attic deme of Aphidnae, and was invited to Sparta at the suggestion of the Delphic oracle to assist the Spartans in the second Messenian war. Later accounts reject his Athenian origin but it is admitted that Tyrtaeus flourished during the second Messenian war (*c.* 650 B.C)—a period of musical and poetical activity at Sparta, when poets like Terpander and Thaletas were welcomed—that he not only wrote poetry but served in the field, and that he endeavoured to compose the internal dissensions of Sparta (Aristotle, *Politica*, v 6). About 12 fragments (three of them complete poems) are preserved. They are mainly elegiac and in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (Εὐνομία), partly to stimulate the Spartan soldiers to deeds of heroism in the field ('Υποθῆκαι—the title is, however, later than Tyrtaeus). The interest of the fragments preserved from the Εὐνομία is mainly historical, and connected with the first Messenian war. The 'Υποθῆκαι were very popular in the army (Athen xiv. 630 F) Of the marching songs ('Εμβατηρια), written in the anapaestic measure and the Doric dialect, only scanty fragments remain. Verrall (*Classical Review*, July 1896, May 1897) definitely places the lifetime of Tyrtaeus in the middle of the 5th century B.C, while Schwartz (*Hermes*, 1889, xxxiv.) disputes the existence of the poet altogether, *see* also Macan in *Classical Review* (Feb. 1897); H. Weil, *Études sur l'antiquité grecque* (1900), and C. Giarratani, *Tirteo e i suoi carmi* (1905). There are English verse translations by R. Polwhele (1792) and imitations by H. J. Pye, poet laureate (1795), and an Italian version by F. Cavallotti, with text introduction and notes (1898). The fragment beginning Τεθνάμεναι γὰρ καλὸν has been translated by Thomas Campbell, the poet.

TYRWHITT (tĭr'ĭt), **THOMAS** (1730–1786), English classical scholar and critic, born March 27, 1730, in London, where he died Aug 15, 1786. He was educated at Eton and Queen's college, Oxford. In 1756 he was appointed under-secretary for war, in 1762 clerk of the House of Commons. His principal classical works are: *Fragmenta Plutarchi II. medita* (1773), from a Harleian ms.; *Dissertatio de Babrio* (1776), containing

some fables of Aesop, hitherto unedited, from a Bodleian ms.; the pseudo-Orphic *De lapidibus* (1781), which he assigned to the age of Constantius; *Conjecturae in Strabonem* (1783); Isaeus *De Menecliis hereditate*, editio princeps (1785); Aristotle's *Poetica*, his most important work, published after his death (1794). Special mention is due of his editions of Chaucer's *Canterbury Tales* (1775–78); and of *Poems, supposed to have been written at Bristol by Thomas Rowley and others in the Fifteenth Century* (1777–78), with an appendix to prove that the poems were all the work of Chatterton. In 1782 he published a *Vindication of the Appendix*. While clerk of the House of Commons he edited *Proceedings and Debates of the House of Commons*, 1620–21 from the original ms. in the library of Queens' college, Oxford, and Henry Elsynge's (1598–1654) *The Manner of holding Parliaments in England*

TYTLER, ALEXANDER FRASER, LORD WOODHOUSELEE (1747–1813), Scottish judge, was born at Edinburgh on Oct. 15, 1747, the son of William Tytler. He was called to the Edinburgh bar in 1770. His first work, a supplement to Lord Kames's *Dictionary of Decisions*, entitled *The Decisions of the Court of Session*, was published in 1778, and a continuation appeared in 1796 In 1780 he was appointed a professor of universal history at Edinburgh. His lectures appeared finally in 1801 as *Elements of General History*. In 1790 he was appointed judge-advocate of Scotland, and wrote a *Treatise on the Law of Courts-Martial*. In 1801 he was raised to the bench as Lord Woodhouselee.

He died at Edinburgh on Jan. 5, 1813.

Besides the works already mentioned, he wrote *Life and Writings of Dr. John Gregory* (1788); *Essay on the Principles of Translation* (1790); a dissertation on *Final Causes*, prefixed to his edition of Derham's *Physico-Theology* (1799); a political pamphlet entitled *Ireland profiting by Example* (1799); an *Essay* on Laura and Petrarch (1801); and *Memoirs of the Life and Writings of Henry Home of Kames* (1807).

TYUMEN, a town in the Omsk region of the Russian S.F.S.R., in 57° 15′ N., 65° 18′ E., on the Tura river, which is difficult for navigation owing to its shallowness. though dredging has somewhat improved it; it is usually ice-free from May 8 to Nov. 15. Pop (1939) 75,537. The highway across the Urals passes through the town, and the railway links it with Sverdlovsk and Omsk. In 1580, Vermak wintered on the site and in the following year captured Isker or Sibir, the fort from which Siberia took its name; the fort of Tyumen was established in 1585. Later it became the centre for the colonization of the Tura, Tavda, Tobol and Ob rivers, but was superseded by Chelyabinsk (1939) 273,127, which had a railway link earlier than Tyumen. In 1893 the first dairy farm was begun near Tyumen by the English wife of a Russian, and this led to the immediate and rapid development of that industry in western Siberia It has the largest tanning and leather industry in Siberia, and has smelting works, saw-mills, match factories and steamer and boat building yards. Wool is dressed, and there are potteries. The koustar (peasant) industries include cooperage, the making of carts, furniture, sledges, horse-collars and wooden household utensils. The Tyumen carpets, with bright floral and animal designs are famous; the former Samoyede vegetable dyes are being replaced by aniline. The ploughs of the Kamen volost are also noted.

TZETZES, JOHN, Byzantine poet and grammarian, flourished at Constantinople during the 12th century A.D. Tzetzes has been described as a perfect specimen of the Byzantine pedant. Excessively vain, he resented any attempt at rivalry, and violently attacked his fellow grammarians. Owing to want of books, he was obliged to trust to his memory; hence he is to be used with caution But he was a learned man, and deserves gratitude for his efforts to keep up the study of ancient Greek literature. Of his numerous works the most important is the *Book of Histories*, usually called *Chiliades* ("thousands") from the arbitrary division by its first editor (N. Gerbel, 1546) into books each containing 1,000 lines (it actually consists of 12,674 lines in "political" verse). It is a collection of literary, historical, theological and antiquarian miscellanies, subsequently re-edited by the author with marginal notes. The *Chiliades* is based upon a collection of letters (107 in number) which are addressed partly to fictitious personages, and partly to the great men and women of the writer's time. They contain a considerable amount of biographical details. He is the author of the *Ilíaca*, an abridgment of and supplement to the *Iliad* in 1676 hexameters, and the Homeric *Allegories*, dedicated to the empress Irene, two didactic poems in which Homer and the Homeric theology are explained on euphemistic principles. Tzetzes also wrote commentaries on Greek authors, for instance, on the *Cassandra* or *Alexandra* of Lycophron (ed. C. G. Müller, 1811), in which his brother Isaac probably helped him. He is our earliest authority (*Chil* 3, 88, 339–48) for the story of the beggary of Belisarius. Mention may also be made of a dramatic sketch in iambic verse in which he describes the wretched lot of the learned.

Editions:—*Chiliades· Corp Poet Graec.* (Lyons, 1612); ed. Kiessling (1826). *Ilíaca:* ed Lehrs & Dübner (Paris, 1868). *Allegories* in Matranga, *Anecdota Graeca*, vol. i. (1850); *Scholia to Lycophron*, ed. Müller (1811).

For the other works of Tzetzes *see* J. A. Fabricius, *Bibliotheca graeca* (ed. Harles), xi 228, and C. Krumbacher, *Geschichte der byz. Lit.* (2nd ed., 1897); monograph by G Hart, "De Tzetzarum nomine, vitis, scriptis," in Jahn's *Jahrbücher für classische Philologie*, Supplementband xii. (Leipzig, 1881).

U

IN the Semitic alphabet the letter 𐤅 (*vau*) was sixth in order, and represented a labial spirant (equivalent to English *v* or *w*) The Greeks used the letter to represent a vowel and placed it last in their alphabet following Τ (*tau*). In the place occupied by 𐤅 (*vau*) in the Semitic alphabet the western Greek alphabets had the letter digamma Ϝ, which they used to represent the bilabial spirant (modern English *w*), a sound that had fallen out of use in the eastern dialects. Greek forms of the letter were Υ, ϒ or ⋁ and the last of these passed from the Chalcidic alphabet into Latin. The form ϒ was identical in both the Etruscan and Lydian alphabets.

The Latins, who at first used the combination FH to express the unvoiced labial spirant (English *f*), came under Etruscan influence to represent this sound by F alone. Thus, this letter, which in Greek had represented the bilabial spirant (English *w*), was no longer available, and *v* had to do duty for both the vowel (English *u*) and the bilabial spirant (English *w*). In later Latin before the separation of the Romance languages the bilabial passed into the voiced spirant equivalent to English *v*. Meanwhile, while the majuscule letter retained its form V, the minuscule and uncial had a rounded form, e.g., 𝔲 (uncial), 𝓊 (cursive of the 6th century) and, later, Carolingian 𝔘. Thus the letter passed into the mediaeval hands having the majuscule pointed form V and the minuscule rounded form *u* and representing two sounds, the vowel (*u*) and the spirant (*v*). In the later middle ages a differentiation took place similar to that between the letters *i* and *j*. The majuscule form, being generally used initially, came to represent the consonant, which usually occurred initially, in all positions; while the rounded form was used exclusively for the vowel. As a result a minuscule *v* and a majuscule *U* were adapted for use when required. The differentiation was wise and useful, and reversed the process by which in the Latin alphabet the single symbol had done duty for both consonant and vowel.

CLASSICAL LATIN AND ONWARDS		U

THE DEVELOPMENT OF THE LETTER "U" FROM THE EARLIEST TIMES TO THE PRESENT DAY

In Attic Greek the sound represented by the letter was a high front rounded vowel (similar to French *u*, German *ü*). In Latin the vowel was a middle high rounded one (similar to the sound of *oo* in *shoot*). In modern English short *ŭ* has become in most positions a low middle vowel closely resembling the original sound of short *ă* (*e.g.*, in the words *but*, *dumb*). There are certain exceptions, however (*cf. bull*, *bush*, *put*). The long vowel has within the last 200 years developed a palatal spirant (the sound of *y*) before it, except when it follows a liquid (*r* or *l*). Contrast the sound of the pure vowel in the word *brute* with that in the words *huge*, *rebuke*. This change is sufficiently recent for such words as begin with long *ū* (*e.g.*, *University*) to be preceded, when the indefinite article is required, by the form *an*, not *a*, showing that the sound was a pure vowel sound. It is still so pronounced in certain cases in the United States of America It is an interesting fact that this change was exactly paralleled in the Boeotian dialect of Greek. (B. F. C. A.)

UAKARI, the name of certain tropical American monkeys, distinguished by their short tails. They constitute an aberrant group of the genus *Pithecia* confined to the forests of Amazonia, and frequently distinguished as the genus *Cacajao*. (*See* PRIMATES.)

UBANGI, a river of equatorial Africa (extreme length 1,400 mi.), the chief northern affluent of the Congo (*q.v.*). The Ubangi (otherwise Mubangi or Mobangi) enters the Congo by various mouths between 0° 22′ and 0° 37′ S. and 17° 40′ and 17° 50′ E. The Ubangi is formed by the junction of the Bomu and the Uele (Welle), the latter rising a few miles from the western edge of the western rift-valley, north of Lake Albert and after a course of 700 mi. it joins the Bomu at Yakoma. Both streams, which have hitherto received numerous affluents, flow westward as a wide river. A short distance below the junction of the Bomu and Uele, the Kota, coming from the borders of Darfur and forming the most northerly extension of the Congo basin, enters the united stream (right). The remaining tributaries, mostly on the right bank, are smaller. Below the confluence with the Kouma, which river offers water communication to within easy reach of the Shari basin, the Ubangi makes a great bend south and immediately it flows between hills and passes the Zongo or Grenfell rapids, which are a barrier to navigation save for small boats in flood season. Above Zongo rapids the river is navigable up to the confluence of the Uele and Bomu, and the former is navigable at high flood up to the Bomokandi confluence in 26° 8′.

The Uele was discovered from the north by G. A. Schweinfurth in 1870, who believed it to belong to the Chad system, but W. Junker, who (1882–83) followed the river to near its confluence with the Bomu, showed that it belonged to the Congo system. In 1885 George Grenfell ascended the Ubangi as far as the Zongo rapids. He was followed in 1886–89 by the Belgian, A. van Gèle, who established the identity of the Ubangi with Schweinfurth's Uele. The Bomu was discovered from the north in 1877 by a Greek, P. Potagos, and its upper course was followed for some distance by Junker. The Ubangi and the Bomu form the frontier between Belgian Congo and French Equatorial Africa, the northern banks of both streams belonging to France.

ÜBERWEG, FRIEDRICH (1826–1871), German historian of philosophy, was born on Jan. 22, 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. Educated at Göttingen and Berlin, he qualified himself at Bonn as *Privatdozent* in philosophy (1852). In 1862 he was called to Königs-

berg as extraordinary professor, and in 1868 was advanced to the ordinary grade He died on June 9, 1871. His compendious, accurate and impartial *History of Philosophy* has been repeatedly re-edited. At first he followed Beneke's empiricism, and opposed the subjectivistic tendency of the Kantian system, maintaining in particular the objectivity of space and time, which involved him in a somewhat violent controversy. His own system he preferred later to describe as an ideal realism, which refused to reduce reality to thought, but asserted a parallelism between the forms of existence and the forms of knowledge.

Uberweg's works include *System der Logik* (1857; 5th ed., 1882; Eng trans. of 3rd ed. by T. M. Lindsay, 1871); *Grundriss der Gesch. der Phil.* (1865–66, 12th ed. 1923–28); an essay (1861) on the authenticity and order of Plato's writings; *Schiller als. Hist. und Phil.* (published by Brasch from his papers, Leipzig, 1884). *See* F. A Lange, *F. Ueberweg* (1871); M. Brasch, *Die Well- und Lebensanschauung F. Ueberwegs* (Leipzig, 1889).

U-BOAT: *see* SUBMARINE CAMPAIGN, 1914–18.

UCCELLO, PAOLO (1397–1475), Florentine painter. His name was Paolo di Dono, but he was commonly called Uccello from his love of painting birds. He was born in Florence, the son of a surgeon barber. When about ten years of age he was apprenticed to Lorenzo Ghiberti, who was then engaged on his first doors of the Florentine Baptistery. It is not known who was Paolo's master in painting, and only a small number of his works have survived. He went to Venice in 1425 and designed a mosaic of St. Peter for the façade of St. Mark's. On his return to Florence in 1433 he was employed in the cathedral; he painted the equestrian figure of Sir John Hawkwood, an English adventurer and soldier of reputation, who had died in the service of Florence in 1394. The painting, now hanging over the door of one of the aisles, was transferred from wall to canvas in 1842. It is a chiaroscuro in terra verde, the first equestrian picture of the Renaissance. In 1443 Paolo designed cartoons for the circular windows of the cupola A year later he probably went to Padua, perhaps in the company of his friend Donatello. His paintings there of giants, in chiaroscuro, at the entrance of the Casa Vitaliani, were much admired by Mantegna. They are, unfortunately, no longer extant. Of the frescoes in the cloisters of S. Maria Novella, Florence, showing the stories of the Creation and the Deluge, only fragments remain. The series of three battlepieces, representing the Rout of San Romano, dispersed in the galleries of Florence, Paris and London, once formed part of the decoration of a large ground floor room, the bedchamber of Lorenzo the Magnificent, in the Medici (Riccardi) palace. The Louvre has a panel, much repainted, of the portraits of Giotto, Brunellesco, Donatello, Antonio Manetti and himself. Paolo's last work is said to have been a fresco painted over the door of the church of S. Tommaso in the Mercato Vecchio. This work apparently met with the disapproval of his friend, Donatello, and Paolo thereupon gave up painting and devoted himself to the study of perspective. He died on Dec. 10, 1475. He had a fine feeling for the decorative value of shapes and colour. He excelled in the representation of the picturesque armour and costumes of his time, and introduced birds, horses and animals of all kinds. He contributed much towards the development of the art of representing natural objects in three dimensional space.

See Vasari, *Vite* (edit Milanesi); Herbert Horne, *Monthly Review* (Oct, 1901), Kern, "Der Mazzocchio des P. Uccello" (*J preuss. K.*, xxvii, 1915); Sir Dominic Colnaghi, *A Dictionary of Florentine Painters* (1928). (I. A. R.)

UDAD, AOUDAD or **AUDAD,** the Barbary sheep, *Ammotragus lervia*, the only wild sheep found in Africa, where it inhabits all the mountain ranges of the north, descending eastward far into the Sudan. It is distinguished by the abundant hair on the throat and fore-quarters of the rams, the length of the tail, the absence of face-glands, and the goat-like structure of the horns

UDAIPUR or **MEWAR,** an Indian state in the Rajputana agency. Area, 13,170 sq.mi. Pop. (1941), 1,926,698. The greater part of the country is level plain. A section of the Aravalli mountains extends over the southwestern and southern portions, and is rich in minerals, but the mines have been long closed. The general inclination of the country is from southwest to northeast, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks in the state, the finest of which is the Debar or Jalsamand, with an area of nearly 21 sq mi The ancient coinage is of the Sassanian or Persian type.

The chief, whose title is maharana with a salute of 19 guns, is the head of the Sisodia clan of Rajputs, and claims to be the direct representative of Rama, the mythical king of Ayodhya He is universally recognized as the highest in rank of all the Rajput princes. The dynasty offered a heroic resistance to the Mohammedans, and boast that they never gave a daughter to a Mogul emperor. They are said to have come from Gujarat and settled at Chitor in the 8th century After the capture of Chitor by Akbar in 1568 the capital was removed to Udaipur by Maharana Udai Singh During the 18th century the state suffered greatly from internal dissension and from the inroads of the Mahrattas. It came under British protection in 1817.

The name of *Mewar* is derived from the Meos, or Minas, a tribe of mixed Rajput origin, who have likewise given their name to a different tract in northern Rajputana, called Mewat, where they are now all Mohammedans. The Mewar Bhil corps, raised as a local battalion in 1840, which was conspicuously loyal during the Mutiny, was in 1897 attached to the Indian army.

The picturesque city of UDAIPUR is 2,469 ft. above sea-level. Pop. (1941), 59,648. It is situated in a valley amid wooded hills, on the bank of a large lake (Pichola), with palaces built of granite and marble. The maharana's palace, which crowns the ridge on which the city stands, dates originally from about 1570, but has had additions made to it till it has become a conglomeration of various architectural styles. On Lake Pichola are two islands, on which are palaces dating respectively from the middle of the 17th and of the 18th centuries. In the neighbourhood are Eklingji (with a magnificent temple of the 15th century), and Nagda, the seat of the ancestors of the chiefs of Udaipur.

There is another UDAIPUR STATE in the Central Provinces (till 1905 one of the Chota Nagpur states of Bengal). The capital is Dharmjaygarh.

UDAL, NICHOLAS (1504–1556), English schoolmaster, translator and playwright, author of the earliest extant English comedy, *Roister Doister*, came of the family of Uvedale, who in the 14th century became lords of Wykeham, Hants, by marriage with the heiress of the Scures. He latinized the name of Udallus, and thence anglicized it as Udal. He is described as Owdall of the "parish of St. Cross, Southampton, 12 years old at Christmas 1516, when admitted a scholar of Winchester college in 1517 (*Win. Schol. Reg.*) He was therefore 164 years of age when admitted a scholar of Corpus Christi college, Oxford, in June 1520; he is called Wodall as a lecturer at that college in 1526 to 1528 (T. Fowler, *Hist. C. C. C.*).

With John Leland he produced "dites" (ditties) "and interludes" (B.M. MS. 18A lxiv) at Anne Boleyn's coronation on May 31, 1533. Leland's contributions are all in Latin; those of "Vidallus" the Welsh form the chief part, are mostly in English, the speeches being each spoken by a "child," at Cornhill beside Leadenhall "at the Conducte in Cornhill" and "at the litle Conducte in Chepe." From the dedication to his *Flowres for Latine Spekynge, selected and gathered out of Terence and the same translated into Englysshe*, published by Bartlet (*in aedibus Berthelett*) (1534), it is inferred that Udal was usher at St. Anthony's school next door to Austin Friars, London. At midsummer 1534 he became head master of Eton. At Eton Udal's salary was £10 and £1 for livery, with "petty receipts" of 8*s.* 4*d.* for *obits*, 2*s* 8*d.* for laundress, 2*s.* for candles for his chamber, and 23*s.* 4*d.* "for ink, candles and other things given to the grammar school by Dr. Lupton, provost."

There was a yearly play, 3*s.* being paid for the repair of the dresses of the players at Christmas, and 2*s.* 4*d.* to a servant of the dean of Windsor for bringing his master's clothes for the players. A payment for repair of the players' dresses recurs every year. Udal has been credited (E. K. Chambers, *Mediaeval Stage*, ii, 244, 192) with producing a play at Braintree while vicar there, recorded in the churchwardens' accounts for 1534 as "Placidas *alias* Sir Eustace." The play is actually cited in the accounts (only extant in 17th-century extracts) "Placy Dacy *alias* Sir Ewestacy," and is the old play of Placidas, mentioned in the 9th century. Udal only became vicar of Braintree in 1537 but did not reside there at that time He held the benefice until 1554. The accounts of Cromwell for 1538 include "Woodall, the scholemaster of Eton, to playing before my lord, £5." Presumably he brought a troupe of Eton boys with him In that year he published a second edition of his *Flowres of Terence* for the benefit of Eton boys. The oftenquestioned account of Thomas Tusser (*Five Hundred Points of Good Husbandrie*) is typical of Eton at the time, as Udal's predecessor Cox is said in Ascham's *Scholemaster* to have been "the best scholemaster and greatest beater of our time":—

> From Fowles[1] I went to Aeton sent,
> To learn straightwales the Latin phrase;
> Where fifty-three stripes given to me at once I had;
> For fault but small or none at all
> It came to pass thus beat I was;
> See, Udall, see, the mercte of thee to mee, poor lad.

Udal's rule of the rod at Eton was short. He was brought up before the privy council on March 14, 1541 for being "counsail" with two of the boys, Thomas Cheney and Thomas Hoorde, for stealing silver images and chapel ornaments. He denied the theft, but confessed to a much more scandalous offense with Cheney, and was sent to the Marshalsea prison. He tried, but failed, to get restored to Eton.

He seems to have maintained himself by translating into English,

[1]Tusser was a chorister of St. Paul's.

in 1542, Erasmus's *Apophthegms* and other works In 1544 he published a new edition of the *Flowres of Terence*. He seems to have taken a schoolmastership in Northumberland or Durham, as Leland in one of his *Encomia* speaks of him, probably at this time, as translated to the Brigantes He purged himself, however, by composing the *Answer to the Articles of the Commoners of Devonshire and Cornwall* (Pocock, *Troubles of the Prayer Book of 1549*, Camd. Soc, new series, 37, 141, 193), when they rose in rebellion in the summer of 1549 against the First Prayer Book of Edward VI. In 1551 he received a patent for printing his translation of Peter Martyr's two works on the Eucharist and the Great Bible in English (Pat 4 Edw VI, pt. 5, m 5; Shakespeare Soc. iii, xxx). He was rewarded by being made a canon of Windsor on Dec. 14, 1551 On Jan 5, 1552 he edited a translation of Erasmus's *Paraphrases* of the Gospels, himself translating the first three, while that on St John was being translated by the princess Mary, till she fell sick and handed her work over to Dr Malet. The work was done at the suggestion and expense of the dowager queen Katharine, in whose charge Mary was. A translation by Udal of Geminus's *Anatomie* or *Compendiosa totius anatomiae delineatio*, was published in 1553; Udal's preface is dated July 20, 1552, "at Windesore." In June and September 1553 (*Trevelyan Pap* Camd. Soc. 84, ii, 31, 33) "Mr. Nicholas Uvedale" was paid at the rate of £13 6*s.* 8*d* a year as "scholemaster to Mr Edward Courtney, beinge within the Tower of London, by virtue of the King's Majesty's Warrant"—the young earl of Devon, who had been in prison ever since he was 12 years old.

Queen Mary on Dec 3. 1554, issued a warrant on Udal's behalf directing "the master and yeomen of the office of the Revells" to deliver whatever Udal should think necessary for setting forth dialogues and interludes, while the exchequer was ordered to provide the money to buy them (Loseley mss Kempe 63, and *Hist mss Com. Rep.* vii, 612) One of these interludes was probably *Roister Doister*; for it was in January 1553/*4*, 1554, that Thomas Wilson, master of St Katharine's hospital by the Tower, produced the third edition of *The Rule of Reason*, the first textbook on logic written in English, which contains, while the two earlier editions, published in 1551 and 1552 respectively, do not contain, a long quotation from *Roister Doister* "taken out of an interlude made by Nicholas Udal." The play was entered at Stationers' Hall, when printed in 1566. Only one copy is known, which was given to Eton by an old Etonian, the Rev Th Briggs, in 1818, who privately printed 30 copies of it. There are strong reasons for believing that *Roister Doister* first appeared in 1553, and therefore could not have been written at Eton or for Eton boys

Nor could it have been written at Westminster school or for Westminster boys, as argued by Professor Hales in *Eng. Studien* (1893) viii, 408 For though Udal did become head master of Westminster, he only became so on Dec 16, 1555, nearly two years after Wilson's quotation from *Roister Doister* appeared He was at Winchester in the interval, perhaps as master of the old City Grammar or High school When the monks re-entered Westminster, on Mary's restoration of the abbey (Nov 21, 1556), the school did not, as commonly alleged, cease, nor had Udal ceased to be master (Shakespeare Soc. iii, xxxiv) when he died a month later. He was buried on Dec. 23, 1556.

Roister Doister well deserves its fame as the first English comedy. It is infinitely superior to any of its predecessors in form and substance It has sometimes been described as a mere adaptation of Plautus's *Miles Gloriosus*. Though the central idea of the play—that of a braggart soldier (with an impecunious parasite to flatter him) who thinks every woman he sees falls in love with him and is finally shown to be an arrant coward—is undoubtedly taken from Plautus, yet the plot and incidents, and above all the dialogue, are absolutely original, and infinitely superior to those of Plautus

The play was printed by F. Marshall in 1821, in Thomas White's *Old English Dramas* (3 vols, 1830) by the Shakespeare Society, vol iii, the introduction to which contains the fullest and most accurate account of his life; in Edward Arber's reprints in 1869; and Dodsley's *Old Plays* (1894), vol iii A. W. Moon (Times Lit Supp Ap. 19, 1928) suggests the ascription to Udal of a lost play *Eaechiac* acted at King's College, Cambridge, before Queen Elizabeth, on Aug. 8, 1564, eight years after Udal's death He identifies this piece with the *Tragoedia de papatu* referred to by Gale (*Scriptores Britanniae*) as Udal's work

UDAL, a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland (*see* ALLODIUM). The udal tenant holds without charter by uninterrupted possession on payment to the crown, the kirk, or a grantee from the crown of a tribute called scat, or without such payment, the latter right being more strictly the udal right. Udal lands are convertible into feus at the option of the udallers.

UDINE, a town and archiepiscopal see of Venetia, Italy capital of the province of Udine, situated between the Gulf of Venice and the Alps, 84 mi. by rail N.E. of Venice, 450 ft. above sea level. Pop. (1936) 54,638 (town); 63,098 (commune). The interesting Porta Aquileia (14th cent.) is almost all that is left of the old city walls. Some of the streets are arcaded and there are some fine palaces. The old castle on a hillock in the centre of the town, at one time the residence of the patriarchs of Aquileia, and now used as a museum and picture gallery, was erected by Giovanni Fontana

(G H Q) during World War I from 1915 to 1917.

UDMURTSK, formerly called the Votyak republic, an autonomous republic, within the Russian S.F S R., originally part of the former Vyatka province. Area 15,019 sq mi Pop. (1939) 1,220,007 (rural 899,287, urban 320,720). It is surrounded by the Tatar A S.S.R , and by the provinces of Sverdlovsk and Kirov, and lies between 56° and 58° 30' N. and 51° 30' and 54° 15' E. Geographically it includes a part of the Ural foothills forming the watershed between the Vyatka and Kama and the tributaries of the Chepsa The soils are not very productive, consisting mainly of sands and clays and gray forest soils, and 43% of the area is forest covered, while there are vast swamps and marshes. The prevailing trees are the fir (76%) and the pine (12%), birch, ash, elm, maple and oak occur in small areas in the south. The climate is extreme, winter is long and severe and summer brief and hot; the rainfall is adequate in the north, but diminishes markedly in the south

Agriculture is the chief occupation, but is of an extensive character; the three-field and even earlier systems are still in use. Rye and oats are the chief crops raised, flax and potato cultivation have increased markedly. The famine and epidemics of 1921–22 diminished the population and lessened the stamina of the survivors.

In spite of the abundance and good quality of the timber, it is not yet satisfactorily exploited, partly because of deficient transport and distance from markets and partly because of lack of skilled workers The rivers are unfavourable for navigation and there is no steamer communication, but on many streams it is possible to float timber after the spring thaws; in summer they become very shallow Mineral wealth includes the iron of the northeast region, slate, copper, quartz sand, chalk and red clay. Peat is abundant and has great future importance in view of the development of peat fuel as a source of electrical energy. The Varzinchsk district has been a health resort since 1888; its curative mud and sulphur springs are noted. Agriculture is insufficient to support the peasants, who supplement their income by a variety of petty trades. Many products of these home industries are used locally, but others are sent to the fair at Gorki, where they form about 9 8% of the turnover of peasant traders.

Factory industry is little developed except at Izhevsk (*q.v.*), the administrative centre, where there are steel works and ammunition factories and where other metal goods, including hunting guns, are produced. In the northeast there is much iron-smelting, and glass, pottery and vegetable oils are produced in the province. There are six saw-mills and a rosin-turpentine factory.

The Moscow-Kirov railway goes through the north of the area and the Kazan-Sverdlovsk, with a branch from Izhevsk to Votkinsk (Udmurtsk), through the south Roads are poor and are not being constructed, owing to lack of capital. The literacy rate was formerly very low, 18% for the whole province and 14% among the Votyaks. The terrible famine conditions of 1921–22 resulted in the closing of schools. They were reopened later and during the Second Five Year Plan new schools were built for the local population. Education on elementary level became compulsory.

The region was inhabited by Finnish tribes when Slav penetration and colonization began in the 12th century. For some time it was under the overlordship of Novgorod, but in the 15th century passed under that of Moscow. Though colonization went on continuously, the forest and marsh and the poor soil conditions did not prove attractive to Russian settlers and the Finnish tribes preserved their language and customs The Votyaks (Otyaks), who call themselves Ot, Ut or Ud, and who are called Ar by the Tatars, may possibly be akin to the Ars of the Yenisei They form 52.3% of the population and are of middle stature, with light-coloured eyes and fair, often red, hair, and Finnish skull and facial characters. Their dialect is akin to that of the Permyaks. They are mainly agricultural, factory

and town populations being Russian, the latter forming 43·3% of the population

UFA, the chief town of the Bashkir A S S R., situated at the confluence of the Ufa river and the Byelaya, in 54° 44′ N., 56° E., at the western edge of the Ural forests Pop (1939) 245,863 Its industries include copper-smelting, sawmilling, flourmilling, rope-making, brewing and fruit-liqueur distilling After the fall of Kazan, which destroyed the centre of unity of the non-Russian elements in the district, the Russians advanced through the Finnic-Bashkirian state and founded Ufa in 1574

UGANDA, a British protectorate in Eastern Equatorial Africa, lying between Lake Victoria and Lakes Albert and Edward, and between the Mountain Nile and Lake Rudolf Lacking a sea coast, it is bounded on the north by the Anglo-Egyptian Sudan, on the east by Kenya, on the south by Lake Victoria, Tanganyika Territory and Ruanda-Urundi, and on the west by the Belgian Congo. The same name was originally applied to the Bantu kingdom of Buganda, which is one of the provinces of the protectorate, and is now styled officially by the correct native name of "Buganda " The Swahili followers of the first explorers always pronounced the territorial prefix, Bu, as a simple vowel, U; hence the incorrect rendering "Uganda." It was first applied to the kingdom on the northwest shores of Lake Victoria discovered by J H Speke in 1862, and in time came to include the large protectorate which grew out of the extension of British influence over Buganda

Frontiers and Area.—The area of the protectorate varied considerably after Buganda was placed under British protection in 1894. From that date up to 1901 various regions were added. Its then Eastern province, which included the northern half of the eastern shores of Lake Victoria, was transferred in 1903 to the East Africa Protectorate (now Kenya Colony) The northern frontier is, roughly, about the line of 4° N and is conterminous with the Anglo-Egyptian Sudan On the Nile itself the frontier was at Lado (a little north of 5° N). By agreement, made in 1914, the frontier on the river was drawn back to Nimule, while the Sudan surrendered to Uganda approximately 4,000 sq mi. W of the Nile which had been part of the Lado enclave. On the south the protectorate includes part of Lake Victoria, and west of the lake the frontier, for the most part, is the 1st degree of S lat. This frontier coincided with the northern frontier of German East Africa On the west, where German, British and Congo Free State territories met, the Uganda frontier was to begin along the 30th meridian of east longitude In 1904 it was found, however, that the 30th meridian had been placed about 25 mi. W of its true position on the maps used when the frontier was agreed upon, and the adjustment of claims caused by this "wandering meridian" gave much trouble As finally settled in 1912 the Uganda-Belgian Congo frontier is drawn so as to include Kizegi, a highland region containing some of the peaks of the Mfumbiro volcanoes, in Uganda, and to put most of Lake Edward in Belgian territory From that lake the frontier goes across the Ruwenzori range and along the Semliki river to Lake Albert, the western half of which, nearly to the north end, fell to the Belgian Congo. Thence the frontier follows the Congo-Nile watershed. In 1922 further frontier changes were made. The Didinga district east of the Nile was taken over by the Sudan, while in 1926 Kenya Colony took over administration of the Rudolf province. These arrangements relieved Uganda of responsibility for remote, unsettled, semi-arid regions where Abyssinians, Somali and Turkana carried on gun-running and raided peaceful tribes The area of Uganda protectorate, allowing for the changes stated, is 93,981 sq.mi. (including 13,680 sq.mi of water). The division into provinces is (1) Buganda, (2) Eastern (originally Central), (3) Western, which after 1939 also included the former Northern province (originally Nile). The following description includes in part the former Rudolf province.

Physical Features.—The protectorate, with a singularly diversified surface of lofty plateaus, snow-capped mountains, vast swamps, dense forests and regions of desolate aridity (valley of Lake Rudolf) offers a remarkable variety of climates. The Eastern province is abundantly watered near Victoria Nyanza and around Mt. Elgon and the noble Debasien mountain (about 50 in. to 100 in. annually); elsewhere in Karamojo and the northern regions, the rainfall lessens to about 20 inches. Busoga and the western part of the Elgon district have a regular West African climate—hot, moist and not over-healthy. These are the conditions of Buganda, a country with an annual rainfall of from 60 to 80 in., a regular West African climate, and severe and frequent thunderstorms. Much the same may be said about the Western province, except for the cooling influence of the Ruwenzori snow range, which pleasantly affects Toro and northern Ankole. The rainfall on Ruwenzori and the central Semliki valley is about 100 in per annum. Along the Ruwenzori range are glaciers and snowfields nearly 15 mi. in continuous length and some 5 mi. in breadth. The area formerly known as Northern province is, perhaps, the hottest part of Uganda. Like the districts round Lake Rudolf, the average altitude (near the Nile) is not more than 2,000 ft., but the rainfall is more abundant, being an average of 30 in per annum.

Mt Elgon (*q.v.*), a vast crater, the rim of which rises to more than 14,000 ft., and its surrounding heights form a mountain country notable for innumerable cascades and dense forests. Elgon dominates a large area and can be seen from the northeast coast of Victoria Nyanza, from near the main Nile stream, from the heights overlooking Lake Rudolf and from Kikuyu escarpment The Eastern province consists of well-forested, undulating land (Busoga) on the coast of the lake, a vast extent of marsh round the lakelike backwaters of the Victoria Nile (Lakes Kioga or Ibrahim, Kwania, etc.), and a more stony, open, grain growing country (Bukedi, Lobor, Karamojo). The Turkana country west of Lake Rudolf is now arid, and most of the rivers have ceased to show running water in their lower courses. A good deal of high land—rising in some peaks to near 10,000 ft.—is found in the eastern part of the former Northern province, and these heights attract moisture and nourish permanent streams flowing Nilewards. But much of the lower ground is stony and poor in vegetation, while the lowland near the main Nile is exceedingly marshy.

The Ripon falls in the centre of the northern coast of the Victoria Nyanza, at the head of the exquisitely beautiful Napoleon gulf, mark the exit of the fully born Nile from the great lake. The Victoria Nile tumbles over 30 mi. of cascades and rapids (descending about 700 ft. in that distance) between Ripon falls and Kakoge. Here it broadens into Lake Kioga (Ibrahim), in reality a vast backwater of the Nile, and continues navigable (save for sudd obstacles at times) through Lake Kioga and thence northward for 100 mi. to Foweira and Karuma falls Between Karuma and Murchison falls the Victoria Nile is unnavigable. At Fajao the navigation can be resumed into Lake Albert. The main Nile stream, when it quits Lake Albert, continues navigable as far north as Nimule (3° 40′ N.). Navigability begins again 100 mi. lower down at Rejaf, from which point steamers ply to Khartoum (*see* NILE)

The topography of the Western province includes the eastern part of Lake Edward, Lake George, the eastern and northern shores of Lake Albert (*q.v.*), part of the great snowy range of Ruwenzori (*q v*), the dense Semliki, Budonga, Mpanga and Bunyaraguru forests, the salt lakes and salt springs of Bunyoro and western Toro, the innumerable and singularly beautiful crater lakes of Toro and Ankole, part of the volcanic region of Mfumbiro (*q v.*) and the healthy plateaus of Ankole The water of Lake Victoria is perfectly fresh. In Lakes Albert and Edward the water ranges from salt to slightly brackish.

Geology.—Although a good deal of geological work has been done, much more remains to be done. What may be called the foundation formation, consisting of Archaean rocks—gneiss, schist and granite—covers large areas through which the Nile cuts its way in alternate narrow gorges and open reaches. In Ankole and Koki, rocks consisting of granular quartzite, schistose sandstone, red and brown sandstone, and shales with cleaved killas rest on the Archaean platform Clay rocks of very varying texture and appearance occur over a wide area in Buganda, the Western province, and the south part of the former Northern province. The Nile, at the Ripon falls, leaps over a basalt dike. The rocks on the

verge of the Kisumu province of Kenya Colony are mainly volcanic (basalt, tuff, lava, kenyte) Thick beds of crystalline limestone occur in the Eastern province, with sandstone in Musoga, basalt round Mt Elgon, slate (Busoga) and iron stone (Busoga and Bukedi). In the former Rudolf province there are the basalt, lava, tuff and kenyte of the volcanic Rift valley, overlying a formation of granite, gneiss and quartz. Gneiss, granite and quartz—the decomposed granite giving the red "African" clay—are the leading features in the formation of the Northern province, of Buganda, and of the Western province, with some sandstone in the littoral districts of Buganda and in Ankole, and eruptive rocks and lava in southwestern Ankole and on the eastern flanks of Ruwenzori. Laterite is a surface deposit of wide occurrence, and iron ore (haematite) is abundant Deposits of Karroo age have been found at Entebbe and elsewhere. It may be added that there is abundant evidence of man's presence in Uganda in the Palaeolithic and Neolithic ages.

Flora.—The vegetation is luxuriant, except in the Rudolf region, which has the sparse flora of Somaliland. In the Western province, Busoga and the Elgon district, the flora is very West African in character. The swampy regions of the Nile and of the Eastern province are characterized by an extravagant growth of papyrus and other rushes, of reeds and coarse grass There are luxuriant tropical forests in the coast region of Buganda, in Busoga, west Elgon, western Bunyoro, eastern Toro, the central Semliki valley and northwest Ankole. The upper regions of Mt. Elgon, Mt. Debasien and Mt. Agoro are clothed with forests of conifers—juniper and yew—and witch hazels (*Trichocladus*). There are also giant yew trees (*Podocarpus*) on the flanks of Ruwenzori and the Mfumbiro volcanoes between 7,000 and 9,000 ft., but no junipers. The alpine vegetation on all these lofty mountains is of a mixed Cape and Abyssinian character—witch hazels, senecios, lobelias, kniphofias, everlasting flowers, tree heaths and hypericums. The really tropical vegetation of Buganda is nearly identical with that of West Africa.

Fauna.—The fauna also has many West African affinities in the hot, forested regions. In the adjoining Kisumu province of Kenya Colony there are several West African mammals, such as the broad-horned tragelaph and the forest pig. These are also found in part of the Semliki forests. As a rule, however, the fauna of the Upper Semliki valley, of parts of Ankole, Buganda and Bunyoro, of the former Northern, Rudolf and Eastern provinces, is of that "East African," "Ethiopic" character which is specially the feature of South and East Africa and of the Sudan right across from Abyssinia to the river Senegal. Among notable mammals the chimpanzee is found in Bunyoro, Toro and northwest Ankole, and has only recently become extinct in Buganda; the gorilla is found in the Mfumbiro region; the okapi inhabits the Semliki forests on the Congo frontier, the giraffe (the male sometimes developing five horn cores) is common in the former Northern, Eastern and Rudolf provinces; there are three types of buffalo—the Cape, the Congo and the Abyssinian; two species of zebra—one of them Grévy's—the African wild ass, the square-lipped ("white") and pointed-lipped ("black") rhinoceroses; the elephant—in 1928 it was estimated that there were 20,000 elephants in the protectorate—hippopotamus, water tragelaph ("Speke's antelope"), Cape ant-bear, aard-wolf (*Proteles*), hunting-dog, and nearly every genus and most of the species of African antelopes. The birds are more West African than the mammals, and include the gray parrot, all the genera of the splendidly coloured turacoes, the unique "whaleheaded stork" and the ostrich.

Inhabitants.—Europeans in 1944 (official estimate) numbered 2,553, of whom about one-third were females. The whites are chiefly missionaries, government officials and traders (the white population in 1909 was 507). The approximately 3,000 Asiatics of 1909, mainly British Indians, had increased to 27,573 (official estimate) in 1944. The African population in 1944 was officially estimated at 3,926,528. These may be broadly divided into three ethnic groups—Bantu, Nilotic and Hamitic, of which the Bantu tribes (including the powerful Baganda) are the most numerous. These indigenous peoples are mainly Negroid with some Caucasian admixture. The so-called Congo pygmies (*Pygmy prognathous*), a pygmylike people of little importance, inhabit the Semliki forest, Kiagwe in Buganda and the western flanks of Mt. Elgon. The Bantu tribes, including the Baganda, Banyoro, Bairu, Basese, Basoga, Bakonjo, Masaba and Kavirondo, are largely concentrated in the areas south and west of the Victoria Nile. The Nilotic tribes, including the Alur, Bari, Madi, Acholi, Gang, Lango, Latuka, Tesi, Sabei (Nandi), Turkana and Karamojo, inhabit the northern regions of the protectorate for the most part The Hamitic groups, which make up the remarkable "Hima" or "Huma" aristocracy in Bunyoro, Buganda, Toro and Ankole, are found mainly in the Eastern province. The pygmies are generally known as Bambute or Bakwa in the Semliki forests. They are reddish-yellow and brownish-black (according to individual variation) in skin colour, with head hair often tending to russet, and body hair of two kinds—black and bristly on the upper lip, chin, chest, axillae and pubes; and yellowish and fleecy on the cheeks, back and limbs. Their faces are remarkable for the long upper lip and the depressed broad nose with enormous alae. Associated with these pygmies is the "Forest Negro" type (Lendu, Lega, Baamba, Banande), of normal human stature, but short-legged and unusually prognathous. The Bantu Negroes include the remarkable Baganda people These last, before the arrival of Arabs and Europeans, displayed a nearer approach to civilization than has as yet been attained by an unaided Negro people. Their dynasty of monarchs can be traced back with tolerable certainty to a period coincident with the reign of Henry IV of England (A.D. 1400). The first Buganda king was probably a Hamite of the Hima stock (from Bunyoro). Until the coming of the white man the Baganda and most of the other Bantu peoples of the protectorate worshipped ancestral and nature spirits, who had become elevated to the rank of gods and goddesses. The influence of Christianity is great among the Baganda A "totem" system is still in vogue. All the Baganda belong to one or other of 29 clans, or "Bika," which are named after and have as totem familiar beasts, birds, fish or vegetables. The Baganda are not sexually a very moral people, but they have an extreme regard for decency, and are always scrupulously clothed (formerly in bark cloth, now in calico). As a general rule all the Bantu tribes in the western half of the protectorate, including the Basoga, are careful to consider decency in their clothing, while the Nilotic tribes are, or until recently were, often completely nude in both sexes More or less nudity among men is characteristic even of the Bahima (Hamites). But in this caste the women are scrupulously clothed.

The Nilotic tribes and Hima are tall people The Bahima are often markedly handsome, even to European eyes. In the Bahima the proportion of Caucasian blood is about one-fourth; in the Nilotic tribes and Bantu from one-sixteenth to none at all The aboriginal stock of the Uganda Protectorate is undoubtedly the pygmy-prognathous, which has gradually been absorbed, overlaid or exterminated by better developed specimens of the Negro subspecies, or by Negro-Caucasian hybrids from the north and northeast.

The languages spoken in the Uganda Protectorate belong to the following stocks: (1) *Hamitic* (Murle and Rendile of Lake Rudolf); (2) *Masai* (Bari, Elgumi, Turkana, Sūk, etc); (2a) Sabei on the northern slopes of Elgon and on Mt. Debasien; (2b) *Nilotic* (Acholi, Alur, Gang, etc.); (3) *Madi* (spoken on the Nile between Alur and Bari, really of West African affinities); (4) Bantu (Lu-ganda, Runyoro, Lu-konjo, Kuamba, Lihuku, the Masaba languages of west Elgon and Kavirondo, etc.); and lastly, the unclassified, isolated Lendu and Mbuba spoken by some of the pygmy-prognathous peoples. Among the Baganda a knowledge of English is common, and Kiswahili is the *lingua franca* of the protectorate, especially in trade.

Agriculture and Trade.—Agriculture, including livestock, is the basis of the protectorate's economy. At the end of Dec. 1937, only 6,565,456 ac. had been alienated, which included 6,232,320 ac. in free grants to natives. There are no native reserves, but natives occupying cultivated land are not disturbed. At the same date, only 267,566 ac., in freehold and leasehold, had been alienated to non-natives. Native crop cultivation (1937) covered

approximately 5,624,189 ac., of which about 3,750,000 ac. were devoted to food crops for domestic consumption exclusively, 1,736,900 ac were under cotton, and the remainder under coffee, tobacco, maize, rice, sugar cane, etc. In Buganda plantains are the staple food: sweet potatoes are grown all over the protectorate; millet is of chief importance to the Nilotic tribes, cassava, peas and beans are other common food crops. The natives also possess large herds of cattle—mostly humped, short-horned breeds—and flocks of sheep, all of the flat-tailed species, and goats Thus livestock gives rise to a large trade in hides and skins Of crops for export cotton holds a pre-eminent place; it is an industry entirely in the hands of the natives Next in importance comes coffee, grown mostly on European-owned plantations European planters have concentrated chiefly on coffee, rubber, and more recently, tea Formerly there was a fair trade in "wild" rubber; that died out about 1912, but plantation (Para) rubber exports began to be of value by 1918. Maize, groundnuts, sesame (simsim), chillies, tea and tobacco are among the minor crops. Cotton is grown by a multitude of small cultivators from seed supplied by the government, experiments favouring a "Nyasaland upland" variety The quality of the product is protected by careful control of the seed supply. The swampy lands of the Eastern province are particularly suitable for the crop The cotton is ginned at a large number of small ginneries instead of, as in the Sudan and elsewhere, by a few large ginneries. Cotton exports began modestly in 1904–05 with the despatch of 180 cwt. cotton lint worth £236. By 1910 value of cotton exported had grown to £60,000; in 1918–19 £965,000 A "boom" followed; in 1924 the cotton exported was 196,000 bales and brought £3,486,000. Thereafter there was some decline, due mainly to adverse weather conditions and the fall in world prices, and aggravated probably by the system of small and expensive ginneries. Exports of cotton fell in value to £3,051,000 in 1926, and in 1927, when a larger area suffered from drought and the crop failed, to £1,690,000. In 1936–37, 1,484,829 ac. were under cotton, yielding 338,391 bales (400 lb.) for export, to the value of £4,269,283.

In 1901–02, when trade returns were first compiled, the value of exports was about £50,000—the chief articles being rubber, ivory, skins and hides These, with some transit trade from Belgian Congo, continued the chief commodities up to 1908–09, when the exports were valued at more than £150,000. From 1910–11 cotton became the leading export, while coffee first figured to a noticeable extent during World War I Imports are of a very miscellaneous character, cotton goods being the largest single item Inevitably, during the process of development, imports exceeded exports in value. Between 1904 and 1917 imports increased from £190,000 to £1,296,000. In the same period exports increased from £60,000 to £1,076,000. In 1917 a customs union was entered into with the East Africa Protectorate (Kenya Colony). Separate statistics for imports have not since been available, but it was soon obvious that exports exceeded imports in value. Exports had risen to £2,393,000 in 1923, and were valued at £5,096,000 in 1925. The great effect of decreased cotton output and lower prices was seen in the export figures for 1926 (£3,597,000), and 1927 (£2,310,000) But the industry was too firmly established to be more than temporarily shaken. The cotton was sent mainly to Great Britain, India and Japan Domestic exports in 1937 totalled £5,702,736, while the principal imports for home consumption in the same year totalled £2,823,754.

The mineral resources of the protectorate are but little known or developed. Since 1926 tin has been mined in the Kagera area, and it is also worked in Ankole, copper has been found in the Ruwenzori region, and mineral oils in the neighbourhood of Lake Albert. Tin first figured in the exports in 1927, when the ore exported was worth £20,000 Gold, tantalite and wolfram have also been exploited for export.

Towns and Communications.—The administrative capital is Entebbe (*a throne*) on a peninsula projecting into Victoria Nyanza in 0° 4′ N., 32° 27′ E. About 20 mi. N by E of Entebbe is Kampala (or Mengo), the capital of Buganda Strictly, Kampala is the name of one of seven steep hills on which the town (pop about 60,000) is built. The European quarters, fort, government offices and Indian bazaar are on Nakasero hill, on Namirembe hill is the Anglican cathedral of St. Paul, replacing the church destroyed by lightning in 1910; on another hill (Rubaga) are the mission and cathedral of the Roman Catholics; on Mengo hill are the town residence of the kabaka of Buganda and the buildings of the *lukiko* (the Baganda parliament) On Kampala hill is the museum, and on Kasubi hill the tomb of Mtesa The port of Kampala is Port Bell, 7 mi. distant, a railway joining the two places. Of other towns the chief is Jinja, by the Ripon falls, a busy cotton and transport centre.

The protectorate is well provided with 2,075 mi of roads (1937), which have the deserved reputation of being the best in East Africa. Access to the outer world was provided, in 1902, on the completion of the railway from Mombasa to Kisumu, on the Victoria Nyanza, and by the provision of steamers on the lake This sufficed until the great development of the cotton trade after World War I. To avoid the need to transport goods across Victoria Nyanza a railway (320 mi. long, begun in 1921 and completed in 1928) was built from Nakuru, on the Mombasa-Kisumu line to a point on the Busoga railway This new railway—165 mi of which are in Uganda—became the main line. It passes through a great cotton belt, and its usefulness was increased in 1929 by the building of a railway from Jinja to Kampala (about 60 mi). By this route Uganda is in direct railway communication with the Indian ocean. The distance between Kampala and Mombasa is 896 mi. Altogether, 322 mi. of the Kenya and Uganda Railway system lie within Uganda, comprising 208 mi of the main line to Kampala, 100 mi from Tororo to Soroti (Eastern province), 17 mi from Mbulamuti to Namasagali on Lake Kioga, and 7 mi. between Kampala and Port Bell on Lake Victoria There are steamer services (besides the boats on Lake Victoria) on the Victoria Nile, Lake Kioga, and Lake Albert and on the Mountain Nile to Nimule. From 1920 onward efforts were made to connect the Sudan and Uganda by air routes, and there are aerodromes at Nimule and Jinja. Motor traffic was first introduced in 1908.

Administration and Revenue.—The protectorate is administered on crown colony lines The governor is assisted by an executive council and (after 1921) by a legislative council, composed of six official and four unofficial appointed members The right of franchise is not enjoyed by any group At the head of each province is a resident. The native states have a large measure of home rule Of these Buganda is the chief and relations with it were settled by treaty in 1900. The *kabaka* (king) is assisted by a ministry and by a *lukiko* or parliament. Similar arrangements have been made with the states of Bunyoro, Ankole and Toro, while in regions where no well-defined native state existed, administrations under recognized chiefs have been built up wherever possible. Revenue is derived from poll taxes, customs duties, an export-cotton tax, trading licences and land rents. The chief items are import duties and the poll taxes After 1915–16 the protectorate was self-supporting. The figures for 1926 were: revenue, £1,389,000, expenditure, £1,295,000 In 1937 revenue totalled £1,959,534, and expenditures were £1,740,887. With growing revenue the administration devoted large sums to education, which up to 1925 had been mainly in the hands of the missionaries, and to public health For the education of the natives a system was developed from village school to public school

HISTORY

The countries grouped under this protectorate were invaded at some relatively remote period—say, 3,000 to 4,000 years ago—by Hamitic races from the northeast, who mingled extensively with the Nile Negroes first, and then with the aboriginal inhabitants of Buganda, Bunyoro and Nandi. These Hamites brought with them a measure of Egyptian civilization, cattle and the arts of metallurgy, pottery and other adjuncts to neolithic civilization There was probably no direct intercourse with Egypt by way of the Nile, owing to the lakelike marshes between Bôr and Fashoda, but instead an overland traffic with Ethiopia (the land of Punt) via Mt. Elgon and the Rudolf regions. In time even this intercourse with the non-Negro world died away, and

powerful kingdoms with an aristocracy of Galla descent grew up in Buganda, Bunyoro, Busoga and Ankole

The kingdom of Buganda especially dominated the lands of Victoria Nyanza in the 19th century King Suna of Buganda first heard of the outer world of white men in 1850 from a runaway Baluch soldier of Zanzibar. Speke in 1862 reached Buganda, the first of all Europeans to enter that country In the early '70s Sir Samuel Baker extended the rule of the Egyptian Sudan as far south as the Victoria Nile. General Gordon, who succeeded Baker, attempted through Colonel Charles Chaillé Long, in 1874, not only to annex Bunyoro but also Buganda to the Egyptian dominions But owing to the indirect influence of the British government, exercised through Sir John Kirk at Zanzibar, the Egyptian dominions were prevented from coming south of the Victoria Nile.

First Christian Missions.—Suna, the powerful king or emperor of Buganda, who was the first to hear of a world beyond Negroland, had been succeeded in 1857 by his still more celebrated son, Mtesa or Mutesa (*Mutesa* means the measurer). Mutesa had received Speke in a most friendly manner. In 1875 he received an epoch-making visit from H. M. Stanley. Stanley, in response to Mutesa's questions about religion, obtained from that king an invitation to Anglican missionaries, which he transmitted to London through the *Daily Telegraph* The letter was entrusted to Linant de Bellefonds, a Frenchman in the Egyptian service, who had been sent to Buganda by Gordon. On his return Bellefonds was murdered by the Bari When his body was recovered Stanley's letter was found concealed in one of his boots and was forwarded to England.

Meanwhile the Zanzibar Arabs had reached Buganda in ever-increasing numbers as traders; but many of them were earnest propagandists of Islam, and strove hard (with some success) to convert to that religion the king and chiefs of Buganda and adjoining countries. In 1877 the Rev C. T. Wilson, one of a party of missionaries sent in answer to Stanley's appeal, arrived in Uganda, and towards the end of 1878 was joined by Alexander Mackay. In 1879 another party arrived by the Nile route In the same year the French Roman Catholic mission of the White Fathers of Algeria was inaugurated, and thus from 1879 dates the triangular rivalry of the creeds of Anglican and Roman Christianity and of Islam.

In 1882 Islam gained an ascendancy, and the French withdrew for a time. In the autumn of 1884 Mutesa died. A great change had been wrought in Uganda during the latter years of his reign. Calico, firearms and swords had replaced the primitive bark cloth and spear, while under the teaching of the missionary-engineer Mackay the native artisans had learned to repair arms and use European tools. Mutesa was a clever man of restless energy, but regardless of human life and suffering, and consumed by vanity. He was succeeded by his son, Mwanga, a cruel, weak and vicious youth then about 18. The intrigues of the Arabs led him to suspect the designs of the missionaries. He became alarmed at their influence over numbers of his people and resolved to stamp out Christianity. The identification of the missionaries with political embassies and their letters of introduction from secular authorities, added to Mwanga's fears and early in 1885 he determined to crush Christianity and Moslems alike. Mackay and the Rev. R. P Ashe were seized and their followers persecuted Then in the autumn of that year Bishop Hannington, unwisely, approached Buganda by Busoga, *i.e*, from the east—the route by which native tradition held that the conquerors of Buganda would come By Mwanga's orders Hannington was murdered (Oct. 1885) In May 1886 there began a renewed and more terrible persecution of Christians. Converts were butchered wholesale; on one occasion 32 were burned at the stake together. The Baganda Christians showed great heroism and the persecution but increased the number of converts. In 1888 a scheme of Mwanga's to entice all the Christian and Moslem converts on to an island in the lake and leave them there to starve miscarried Mwanga then fled and after a time made his way to a French mission station at the south end of Victoria Nyanza. In his absence his eldest brother Kikewa was made king and the principal offices were divided among the three parties—the Ba-Ingleza ("English" Protestants), the Ba-Fransa ("French" Roman Catholics) and the Ba-Islamu (Moslems). But the Moslems, under Arab instigation, treacherously attacked and murdered many of the Christian chiefs and the Christians fled to Ankole. For a time the Arabs were in the ascendant and as Kikewa refused to be circumcised he was dethroned. His brother Karema was made king and large numbers of the peasantry were forced to submit to the hated circumcision.

The "French" and "English" factions even in these straits could not avoid quarrelling. They asked Mwanga to come back on conditions which he accepted, and he was brought across the lake by a trader named Stokes (formerly a mission-agent) whose main aim seems to have been to secure ivory Mwanga's attempt to recapture Mengo was unsuccessful and he took refuge in an island on the lake. The Christians now asked the missionaries to return to keep the peace between them and among those who came was Père Lourdel, who gained much ascendency over Mwanga. The Christians defeated the Moslems in Oct. 1889, most of the Arabs with the Baganda being killed. The Moslems, however, rallied, gained a victory in November, but were finally beaten in Feb. 1890. Before this decisive victory Mwanga had appealed for help to a caravan then near the lake, led by Frederick John Jackson, who had been sent by the newly formed Imperial British East Africa company (the I.B.E.A.) to extend British influence (*see* KENYA COLONY). Jackson had instructions not to go to Uganda. While he was absent from his camp Karl Peters, at the head of a so-called German Emin Pasha Relief Expedition, arrived. He read Jackson's correspondence and hastened on to Buganda. There with the help of Père Lourdel—who in Dec. 1889 in Mwanga's name had offered to accept the British flag—Peters concluded a treaty with Mwanga Jackson hearing of Peters's doings followed him up to Mengo—but Peters had hurriedly departed to the south end of the lake. Jackson was in a difficulty; finally he decided to take back to the coast an envoy from each faction The day before he left Père Lourdel died.

Lugard's Work.—All these local intrigues were rendered useless by the Anglo-German agreement of July 1890 which placed Uganda in the British sphere of influence. Thereupon the I.B.E.A. company, in Oct. 1890, instructed Capt. F. D. Lugard (afterwards Lord Lugard), then at Kikuya, halfway between the coast and the lake, to go to Uganda. Marching with unprecedented rapidity, Lugard entered Mengo on Dec. 18 with a force of 50 Sudanese soldiers and about 250 armed carriers. Lugard, by introducing the names "Protestant" and "Catholic"—till then unknown—and by insisting that all religion was free, endeavoured to dissociate it from politics. This attitude was welcome to neither faction, and for some days the position of the new arrivals on the little knoll of Kampala was very precarious. Lugard's first object was to obtain a treaty which would give him a right to intervene in the internal affairs of the country and after some critical episodes such a treaty was signed on Dec 26. Lugard's position was strengthened by the arrival in Jan. 1891 of Captain W. H. Williams, R.A., with a small force of Sudanese and a maxim gun. Seeing, however, that the situation in Buganda was impossible unless they had a strong central force, which the I.B.E.A. company could not provide, Lugard and Williams formed the idea of enlisting the Sudanese who had been left by Emin and Stanley at the south end of Lake Albert Passing through Ankole and Bunyoro, along the northern slopes of Ruwenzori, Lugard reached Kavali at the south end of Lake Albert He brought away with him 8,000 Sudanese men, women, children and slaves, under Selim Bey (an Egyptian officer). Some of these he left at posts he established along the southern border of Bunyoro. After an absence of six months from Buganda, Lugard reached the capital at the end of the year (1891) with 200 or 300 Sudanese soldiers and two or three times that number of followers. Meanwhile Williams, amid endless difficulties, with a mere handful of men, had managed to keep the two factions from civil war

Not long after Lugard's return lawlessness again broke out and several murders were committed. In spite of strenuous efforts on Lugard's part to avert war the French party early in 1892 attacked the English, who had assembled round Kampala. The

king and French party were defeated and fled to the Sese Islands. The king and chiefs (except two ringleaders) being offered reinstatement, they appeared anxious to accept Lugard's terms, but the French bishop joined them in the islands, and from that day all hopes of peace vanished. Fighting was recommenced by a "French" attack on "English" canoes, and Williams thereupon attacked the island and routed the hostile faction. After this the "French" slowly concentrated in Buddu in the south, the Protestants migrating thence. Mwanga who was eager to accept Lugard's offers of reinstatement, succeeded in escaping from the custody of his own party and arrived in Mengo on March 30, 1892. A new treaty was made, and the British flag flew over the capital, while the French party was given a proportion of chiefships and assigned the province of Buddu. These were liberal conditions, while later, to close a controversy with France, the British government paid £10,000 to the French priests for damage.

The Mohammedans now clamoured for recognition. Lugard went to meet them, and succeeded in bringing back Mbogo, a half brother of Mtesa—Karema had died—to Kampala, and in assigning them three minor divisions of Uganda (afterward reduced to one).

A British Protectorate.—Lugard on his return to Uganda at the end of 1891 had received orders to evacuate the country with his whole force, as the I B.E A. company could no longer maintain their position. A reprieve till the end of 1892 followed, funds having been raised by the Church Missionary Society and friends The lives of many Europeans were at stake, since anarchy must follow withdrawal, and the repudiation of British pledges to the natives. Moreover, abandonment would have left the headwaters of the Nile to fall into the hands of some other—possibly hostile—European power. In June 1892, therefore, Lugard determined to leave for England to appeal against the decision for abandonment Williams remained in Uganda, where the outlook was now fairly promising, and every effort was made to reduce expenses On arrival in England Lugard found that the British government had decided not to give the company any help to maintain its hold upon Uganda A strong section of the Liberal party, headed by Sir William Harcourt, demanded the abandonment of Uganda; an equally strong agitation was set on foot for its retention, with the result that Lord Rosebery (then prime minister) despatched Sir Gerald Portal to report on the best means of dealing with the country. Portal and his staff reached Uganda in March 1893, the country at the time showing every mark of returning prosperity. Portal was not long in making up his mind; he recommended to the imperial government the retention of Uganda (*i.e.*, Buganda), the abandonment of Unyoro (Bunyoro) and Toro, and the construction of a railway halfway only to the lake. He departed after two and a half months' residence, leaving Capt. J. R. L. Macdonald in charge.

In Nov. 1893 Colonel (Sir Henry) Colvile arrived to take charge, and at once led the Baganda army against King Kabarega of Bunyoro. That country was completely overrun and Colvile built a line of forts from Buganda to Lake Albert, of which he left Major A. B. Thruston in command. In June 1894 Uganda (*i e.*, the kingdom of Buganda) was declared a protectorate, and at the end of the year Sir Henry Colvile was invalided Peace seemed assured in Uganda, territorial limits to religious teaching were abolished, English Roman Catholic priests were added to the French Fathers, and the material progress of the country was marked. A few European traders settled in the country, good permanent houses were built, roads were made and kept in repair, and many new industries introduced, chief among which were the expression of oil from various oilseeds and the cultivation of coffee. Trees were imported and land set aside for planting forests In 1896 the building of a railway from the coast to Uganda was begun In the same year the protectorate was extended over Bunyoro and Busoga.

The Sudanese Mutiny.—In the middle of 1897 this era of peace was rudely interrupted. Macdonald had returned to East Africa in command of an exploring expedition, for which Colonel Trevor Ternan, the acting commissioner, had been ordered to supply 300 Sudanese In June George Wilson, subcommissioner at Kampala, discovered a plot to revolt and in July Mwanga fled to the south of Buddu and raised the standard of rebellion. The rebels were defeated, while Mwanga was made a prisoner by the Germans Ternan, unaware of the disaffection of his men, now sent three companies to Macdonald, selecting those who had been continuously fighting in Bunyoro, Nandi and Buddu This caused great discontent, which was increased by the fact that their pay was six months in arrears and their clothing long overdue The men, too, had other grievances, they were especially sore at again being sent on service without their wives.

After Colonel Ternan's departure on leave the three companies who had joined Macdonald broke out into revolt in the Nandi district (East Africa Protectorate) and set off to Uganda, looting the countries they passed through Macdonald and F J. Jackson followed with a force of Zanzibaris. Meanwhile Major Thruston—a man justly loved by his soldiers, in whom he had complete confidence—hurried to the garrison at Luba's near the Ripon Falls, relying on his personal influence to control the men He and two other Europeans were seized and made prisoners On Oct 19 the mutineers were defeated by Macdonald's force The same night the Sudanese leaders, fearful lest their men might submit, murdered Thruston and his companions and sent [illegible] gambi and carried it with great gallantry A large number of Indian troops arrived early in 1899 and in May Colonel C G Martyr inflicted another heavy defeat on the mutineers at Mruli. Mwanga, however, managed to get through and join Kabarega and the rebels in the north In June 1899 Colonel J T. Evatt had the good fortune to capture both Mwanga and Kabarega, who were subsequently removed to the Seychelles, where Mwanga died in 1903 (For Kabarega *see* UNYORO) Colonel C. Delmé-Radcliffe subdued the last of the Sudanese mutineers in 1900–1901

In the autumn of 1899 Sir Harry Johnston was sent out to Uganda as special commissioner and he remained there till 1902. During that period he settled many disputes, included Toro, Ankole, Bukedi and other regions in the protectorate, reduced expenditure and increased revenue. He gave the kingdom of Buganda a definite constitution, settled the land question in that kingdom and in other regions and also the question of native taxation. The land settlement had very important, if undesigned, results for its effect was to do away with tribal tenure and substitute the freehold and leasehold system, with certain undesirable results. By the treaty of Mengo, signed in March 1900, the young king of Buganda, Daudi Chwa, a son of Mwanga, born in 1896, was accorded the title of his highness the Kabaka. During his minority the kingdom of Buganda was governed by regents. Of these the most notable was Sir Apolo Kagwa (d. 1927), a true statesman An epidemic of sleeping sickness, which between 1901 and 1909 caused more than 250,000 deaths, did not prevent the country making progress, the material development being accompanied by the conversion of most of the Buganda to Christianity. The completion in 1902 of the railway from the Indian ocean to Lake Victoria did much to facilitate trade. With settled conditions the administration was transferred, 1906, from the foreign to the colonial office, Sir Hesketh Bell being the first governor

Social Conditions.—Christianity and western civilization increasingly made their influence manifest, while material prosperity brought new problems. Uganda being, however, a "black man's country," there was no clash between European and African interests. Officials and missionaries continued to play a leading part in the evolution of the people, and they were backed up by the native administration of the various states included in the protectorate, which have a large degree of autonomy. Daudi Chwa, who attained his majority on Aug 8, 1914, and was created a K C M G. in 1925, and Sir Apolo Kagwa, who on ceasing to be regent became prime minister, were foremost in giving aid to the British in World War I. Other rulers and tribes were equally willing, and by supplying 10,000 soldiers, a native medical corps and more than 160,000 carriers Uganda helped substantially to defeat the Germans in East Africa.

The country suffered from a severe famine in 1919 and from the general trade depression in 1921–22. But it quickly recovered In cultivating cotton, an industry which started on a small scale in 1904 and 20 years later had attained great proportions, the natives found an easy method of acquiring wealth; a fact not without danger and adversely affecting the labour supply for other work. However, there was steady growth in education and a power of adaptability to new conditions was clearly noticeable. At a critical period of development Uganda owed much to the wise guidance of Sir R. T. Coryndon, governor from Feb 1918 to Sept. 1922. It was during this period, in 1921, that a (nominated) legislative council was created.

Being dependent upon the railway through Kenya Colony for its outlet to the sea Uganda had with that colony a customs and railway

union. The question of political federation, which was raised after World War I, presented, however, difficulties, arising chiefly from the presence of a large white population in Kenya, whereas Uganda depended upon the African for prosperity. It was chiefly to meet the demands of the native cotton growers in Uganda that the railway extension was undertaken which on its completion in 1928 enabled the crop to be sent direct to Mombasa. In Jan 1929, a commission, with Sir E Hilton Young as chairman, recommended the appointment of a high commissioner for Kenya, Uganda and Tanganyika, with executive powers This was to be "a preliminary step" to a governor-generalship for "Eastern Africa." The recommendation, however, was not acted upon

UGRO-FINNISH LANGUAGES: *see* FINNO-UGRIAN LANGUAGES.

UHLAND, JOHANN LUDWIG (1787–1862), German poet, was born at Tübingen on April 26, 1787. He studied jurisprudence at the university of his native place, but also devoted much time to mediaeval literature. Having graduated as a doctor of laws in 1810, he went for some months to Paris; and from 1812 to 1814 he worked at his profession in Stuttgart, in the bureau of the minister of justice. He had begun his career as a poet in 1807 and 1808 by contributing ballads and lyrics to L. von Seckendorff's *Musenalmanach;* and in 1812 and 1813 he wrote poems for J. Kerner's *Poetischer Almanach* and *Deutscher Dichterwald.* Uhland's ballads follow the form of the masterpieces of Goethe and Schiller, but they have some of the spirit of naive wonder of the mediaeval poet, *i.e.,* they belong definitely to the Romantic school. But his style has a precision and grace which distinguish his best work from that of most of the contemporary Romantic poets. His work strengthened the national spirit, and he himself did good practical work as a liberal member of the Wurttemberg assembly, and, later, as a member of the Frankfurt parliament In 1815 he collected his poems in a volume entitled *Gedichte* To almost every new edition he added some fresh poems He wrote two dramatic works—*Ernst, Herzog von Schwaben* and *Ludwig der Baier*—the former published in 1818, the latter in 1819

Uhland was not only a poet and politician; he was also an ardent student of the history of literature. In this field he published *Das altfranzosische Epos* (1812); *Der Mythus von Thôr nach nordischen Quellen* (1836), and *Alte hoch- und niederdeutsche Volkslieder* (1844–45). He died at Tübingen on Nov. 13, 1862.

Uhland's *Gesammelte Werke,* edit by H. Fischer, were published in 1892 in 6 vols; also by L. Frankel (2 vols., 1893) and L. Holthof (1901). His *Gedichte* passed through nearly 50 editions in the poet's lifetime; jubilee ed. of the *Gedichte und Dramen* (1886) A critical ed by E Schmidt and J Hartmann appeared in 1898 (2 vols.) Uhland's *Schriften zur Geschichte der Dichtung und Sage* were published in 8 vols. (1865–73), his *Tagebuch von 1810–1820* by J. Hartmann (1893). *See* H. Mayne, *Uhlands Jugenddichtung* (1899); H. Schneider, *Uhland. Leben, Dichtung, Forschung* (1920)

UHRICHSVILLE, a city of Tuscarawas county, Ohio, U.S.A., 85 mi. S. by E. of Cleveland, on Stillwater creek and federal highways 36 and 250; it is served by the Baltimore and Ohio and the Pennsylvania railways. Pop. (1930) 6,614; in 1940, 6,435; in 1930, 6,437. Coal is mined in this region, and the city is one of the principal centres in the country for the manufacture of sewer pipe and other clay products. It was settled about 1803 and incorporated in 1832.

UIGHUR, the name of a Turkish tribe and dynasty who came from the east and ruled in Kashgaria from the 10th to the 12th century. They used a variety of the Syriac alphabet. (*See* TURKS)

UIST (oist), **NORTH AND SOUTH,** islands, outer Hebrides, Inverness-shire, Scotland. North Uist lies southwest of Harris (Long Island), from which it is separated about 8 mi. by the Sound of Harris. The island is 13 mi. long by 17 mi wide. Population (1931) 2,349. The highest point is Mt. Eaval (1,138 ft.). The principal sea-lochs are Loch Maddy and Loch Eport, both on the east. On the east coast the surface is mostly swampy moorland, but on the west there is some fertile soil. The inhabitants are chiefly engaged in crofting, fishing and cattle rearing. The principal village, Lochmaddy, is a trade centre, and a favourite resort of anglers, being a regular calling station for the steamers from Glasgow and Kyle of Lochalsh. The islands of the parish of North Uist (pop. 1931, 2,827) comprise—to the southwest Baleshare (pop 1931, 136), Kirkibost (6), Heisker (33), the Monach group, with a lighthouse on Shillay (3); to south, Grimsay (259) and Ronay (6); to northeast, Leiravay (8); to the north, Boreray (8) and Vallay (19).

South Uist had a population in the island (1931) of 2,810 and in the parish of 4,236, an extreme length of 27 mi., an extreme width of 7 mi. Towards the northeast it is mountainous. The chief sea-lochs are Loch Boisdale, frequented by anglers, Loch Eynort and Loch Skiport on the east coast. On the east side the surface is mainly alluvial peat, broken by hills, but on the west there is a belt of productive land. Besides crofting, the inhabitants are engaged in the fisheries and cattle raising. Steamers from Glasgow, Portree, Oban, etc., call regularly at the village of Lochboisdale, where there is a wireless station. The islands attached to the parish of South Uist include, to the south, Eriskay (pop 420), where Prince Charles landed on Aug 2, 1745; to the northeast, Wiay; to the north, Grimsay (19); Flodday (26), just off the northeast shore of Benbecula; and Benbecula (961), with an area of 40 sq.mi., from which there are low-tide fords to North Uist and South Uist.

UITENHAGE, 33° 46′ S. 25° 27′ E.; altitude 169 ft; 21 mi. by rail from Port Elizabeth, South Africa. Pop. (1946) 26,520 including 11,090 whites, 10,016 natives, 287 Asiatics and 5,127 coloured. The town was founded by De Mist in 1804, on the Zwartkops river. Water courses flow along the sides of the streets, which are lined with trees. On the banks of the river are two large wool-washing establishments. In the town are railway workshops, the main industry of the place.

UITOTOAN (WITOTOAN), a group of tribes of South American Indians, forming an independent linguistic stock. The Uitotos (Witotos), from whom the stock takes its name, and the tribes related to them live in the region of the Peruvian-Colombian border, between the Yapura and Putumayo rivers, especially on the Caraparana and Igaraparana, northern tributaries of the latter. The Witotos are a short, dark-skinned folk, with almost Negroid faces. They are on a lower level of culture than their neighbours in many respects. On the other hand they have developed the drum language to a surprisingly high point. Their religious beliefs and mythology are of great interest.

See T. Koch-Grünberg, *Zwei Jahre unter den Indianern* (Berlin, 1909); K. Th. Preuss, *Religion und Mythologie der Uitoto* (Leipzig, 1921).

UJIJI, a town of East Africa, on the east side of Lake Tanganyika, in 4° 55′ S. and 29° 40′ E. Pop. (1936) about 10,000, largely Swahili. Ujiji was the meeting point of merchants from all parts of the lake and the terminus of a caravan route from Dar-es-Salaam. The Zanzibar Arabs made it their headquarters in the first half of the 19th century and it became a great slave and ivory mart. In 1858 Richard Burton and J. H. Speke reached Ujiji, being the first white men to see Lake Tanganyika. David Livingstone, coming from the south, reached Ujiji in 1869, and it was there that H. M. Stanley found him on Oct. 28, 1871. The first steamer on the lake was launched at Ujiji in 1884. Soon afterwards it became part of German East Africa and was chosen as the lake terminus of the railway (completed in 1914) from Dar-es-Salaam. Ujiji harbour has become very shallow and the terminus of the railway is at Kigoma, 4 mi. to the north Ujiji was occupied by Belgian Congo troops in 1916, and in 1921 was transferred to Great Britain as part of the mandated territory of Tanganyika It is the centre of the lake fishing trade

UKRAINE, a constituent republic of the U.S.S.R., recognized by the soviet government in December 1920, when a treaty was signed defining the relations between the Ukraine and the Union of Soviet Socialist Republics. Area 214,633 sq.mi. Pop. (1946) 40,548,310. It lies between 46° and 52° 20′ N. and 26°

10′ and 40° 14′ E., and is bordered S. by the Black sea, the Crimean A.S.S.R. and the Sea of Azov, W. by Bessaraba, N. by the White Russian S.S.R. and the region of Orel and N.E. and E by the regions of Kursk and Voronezh and by the North Caucasian Area. The Moldavian A.S.S.R. (*see* MOLDAVIA) was linked administratively with the Ukraine until it became a constituent member of the U.S.S.R. in 1940.

Geology.—Geologically and structurally the Ukraine is distinct from Russia to the north of it; the Tertiary sea covered most of it, but extended very little further to the north, and the ice of the glacial epoch hardly reached it, except in the northwest and where Don and Dnieper mark southward extensions of glacial river systems. Its plateau system, the Azov Horst of Suess, composed of granite gneisses, stretches northwestward from the Sea of Azov through Volhynia and Podolia, and is generally supposed to be the eastward continuation of the Hercynian system This horst exerted a strong tectonic effect on the fold system of the Donetz which was thrown up from the end of the Palaeozoic to the beginning of the Tertiary period, and also caused the tectonic disturbances of the post-Cretaceous period indicated by the lines of Karpinsky, a northern line stretching from the Volga through the bend of the Don, the source of the Donetz, the delta of the Desna and Polyesie to Warsaw and a southern from the delta of the Don, past the falls of the Dnieper to the source of the Bug. Recent seismic observations indicate that tectonic disturbances are still going on in the district and there is some evidence that elevation of the plateau region has occurred in post-glacial times

River Formations.—The chief rivers are the Dniester, Bug, Dnieper and the Donetz, a tributary of the Don; tectonic disturbances may account for their parallelism. The soils of the region fall into three main groups. In the ancient forest zone of Polyesie, where morainic clays and sands form the base, are ash-coloured or podzol soils (*See* RUSSIA: *Soils and Their Influence*). A zone of black earth formed on loess under steppe climatic conditions lies south of this region, but the humus content has been diminished by the spread on it of forests as the moister and milder climatic zone pushed southward. The town of Kiev stands on the northern limit of this zone, and its rise may be connected with the lesser density of the forest on the loess to the south of it Spurs of the central Russian plateau are thrust into the northwest But the main feature of the Ukraine is its steppe land, covered with *chernozyom* (black earth) formed on loess, more sandy to the north and more clayey to the south. The rich black earth belt runs generally southwest to northeast, diminishing in humus content toward the north and toward the south. In the southeast, in accordance with more arid conditions, it displays a tendency to salt efflorescences. Along the north shores of the Black sea extends the Pontic steppe. The Black sea was part of an Upper Miocene and Sarmatian sea, which formerly extended inland as far as the Vienna basin, but which shrank in Tertiary times; the Pontic steppe bears traces of this transgression It approaches the sea by a steep incline only broken by the river estuaries, characterized in this region by limans. These are submerged, eroded river valleys locked from the sea by detritus.

Where a stream of great volume enters the sea (*e g*, Dniester, Bug, Dnieper), the bar is pierced in one or two places and something resembling a delta is formed. But in the case of those streams which do not bring down enough water to cover the loss from evaporation in the liman, the bar becomes continuous and the water within the liman is increasingly rich in salts. The mud of these limans has curative properties and small health resorts are dotted along their shores. Along the river valleys are thickets of sedge and reed, with marsh forest and meadow. The Pliocene lime which predominates in the Pontic steppe covers the crystalline substratum, which is, however, often laid bare by the action of streams.

Forest destruction at the source of the streams has led to flooding after each melting of the snows. The heavy mantle of black earth and loess, the loose chalk and the marl, sand and clay of the Tertiary strata on the Ukrainian steppe are readily cut into by running water, and many acres of fertile agricultural soil have been washed away from the ravine slopes. An institute for research into amelioration of this problem was established and efforts were made to prevent further forest cutting, to encourage replanting and to introduce transverse plowing across the slopes and drainage channels round the fields

The chief river is the Dnieper (*q v*) which has formed one of the links between the Black sea and the Mediterranean and the Baltic from ancient times The Pripet river joins the Dnieper a little south of the northern boundary of the Ukraine and almost doubles its volume, the Dnieper from this point often dividing into two or more channels, and having many islands The right bank is high and rocky and the left a low plain, though in three places the plain extends along both banks During the melting of the snows the river overflows the islands and the plains along its shores, leaving them covered with fertile alluvium At the mouth of the left bank Samara tributary, both banks of the Dnieper become precipitous. The post-Tertiary elevation of the Azov horst forced the river to dig its bed into the granite-gneiss rocks, but in many places ledges of these rocks lie across its path and it descends in a series of waterfalls, now being harnessed for production of electric energy. Below the falls the river expands, flowing in several channels, and silting up its liman so quickly that constant dredging is necessary to keep the port of Kherson open even for small seagoing vessels. Of its numerous Ukrainian tributaries, the Tetelev and Ingulez on the right, and the Desna on the left, are the most important, the latter being navigable for a great distance

The present scheme of electrification of the falls includes a scheme for deepening the river channel so as to make it available for large steamers and for providing adequate canals in this region. The lower course of the Dniester (*q.v*) forms the boundary between Bessaraba and the Ukraine. Its left bank Ukrainian tributaries are short, and flow from the Volhynian-Podolian plateau They are full at the melting of the snows and have carved deep canyons, but in summer they almost disappear. Between the Dniester and the Bug, no river reaches the sea, all being shut in by limans. The Bug (*Boh*) is a shallow stream, not navigable even after the spring thaws except near its mouth, and its tributaries in summer become mere chains of ponds; rapids are formed in its bed by ledges of the granite-gneiss horst. The upper course of the Donetz with its white chalk cliffs lies in the Ukraine. On the whole the waterways of the Ukraine are not favourable to navigation, the Dnieper and its tributaries giving the greatest possibilities

Climate.—The climate is everywhere continental, but increasingly so toward the southeast. The Ukraine south of a line through Dniepropetrovsk to Kishinev differs from the north in being exposed to east and southeast winds which prevent the snow brought by the south winds from the Black sea from becoming very thick. If these easterly winds are prolonged and intense, the snow hardly remains at all, this being a contributory cause of bad harvests. Sometimes these east winds bring snow and are so cold and violent that the flocks of sheep are destroyed.

Other causes of bad harvests are a rainless spring, and the return of easterly winds and frosts in May. The maximum rainfall is in summer and falls mainly in heavy showers which may wash away parts of the surface and which, in any case, run off quickly. Winter is severe, the average temperature at Kiev, lat. 50° 30′ N, in January being 34° F., colder than that of Hammerfest, lat. 70° 35′ N. The duration of frost on the Pontic steppe is 2 months and in the rest of the Ukraine 3 to 4 months. Spring in the south is liable to dry east winds bringing sandstorms, but toward the northwest it is moister, with frequent alternations of snow and frost. In summer most of the Ukraine lies south of the 68° F. isotherm and high temperatures prevail in the south in July and August. The amount of rainfall diminishes from the northwest (22 in.) to the southeast (12 in.) and yearly fluctuations especially in the important spring rains are great.

Archaeology.—The Ukrainian steppes and south Russia are of peculiar interest historically and archaeologically. Rostovtzeff points out that the French emigrants who found a home in Russia after the revolution first gave a stimulus to the study of the archaeology of the region. Russian scholars became interested and

a copious literature and rich museum collections now exist. The presence of Palaeolithic man has been demonstrated at Kiev, and the relics of Neolithic man are everywhere abundant The intersection here of routes from the orient via the Caucasus and the Black sea, of Greek influences, of influences from the west via the Danube and from the north via the Dnieper is reflected in the cultural wealth of the early civilizations, while the openness of the steppes to the east led to their repeated submergence by nomads from the steppe. Easy portages connected the rivers, and steppe to the south was open and treeless, while the forests on the loess to the north were younger and less dense than those of the south, and were also intersected by glades; the reasons for the lesser density of forest on the loess steppe are not yet fully worked out.

The conquerors in the region have too often been considered as transitory nomads, but there is ample evidence to prove that the fertility of the region and the ease with which tribute could be extracted from the inhabitants encouraged settlement as well as conquest, thus leading to a rich variety of cultural intermixture. Little is known of the Cimmerians and the extent of their kingdom, but the Iranian Scythians certainly had centres on the steppes between the Don and the Dnieper. These Cimmerian and Scythian kingdoms were the base on which the Greek colonies of the Black sea depended, later history goes to show that such colonies could not exist without a fairly stable civilization on the steppe to the north Sarmatian tribes, Iranians like the Scythians, succeeded to this kingdom, and the blending of Greek and Iranian culture had a marked influence on the civilizations of central and eastern Russia.

The Neolithic civilization of the Ukraine, the so-called Tripolye (*q.v.*) culture, named from the finds at that place, as evidenced by its incised and painted pottery, was peculiarly rich and belonged to an agricultural people. The kurgan or barrow graves, common to steppe and woodland, and containing skeletons daubed with red paint and buried in the contracted position, though probably contemporary, show evidence of a nomadic people, while graves in the Kharkov district seem to indicate an absorption of the steppe nomads into agriculture This juxtaposition of settled agriculture and nomadic tribes is still to be observed in the region to the east, where the Kalmucks and some Kirghiz tribes at the present time lead nomadic lives.

In the course of the 8th and 7th centuries B.C. the mouths of the Dniester, Bug and Dnieper were occupied by Milesian fishing colonies, Tyras on the Dniester and Olbia on the Bug and Dnieper. Olbia became the outlet for the furs, slaves and amber of the north and an inlet for Greek influences, which penetrated as far as the Kama; the Milesian power decayed in the 5th century B.C. and Athens took its place in trading relations with Olbia, the corn of south Russia being increasingly needed for the Mediterranean civilizations. With the advance of the Sarmatians to the steppe between the Don and the Dnieper in the second half of the 3rd century B.C., the Scythians moved farther to the north and west, as evidenced by their remains in Kiev and Poltava, but their advance was checked by Germanic tribes, and anarchy began to prevail in the steppe

From their first appearance on the Dnieper the Sarmatian Alans allied themselves with the Germanic tribes in a struggle against Rome and destroyed Olbia and the Roman fortresses on the Crimea. Celtic civilization in the region is represented in the basin of the Dnieper by La Tène finds, probably remains of the Galatian tribes. Roman influence was felt in the Black sea region under Hadrian and his successors, who established a fort at Olbia, but in the 3rd century A.D. Roman influence declined on the Ukrainian shore. (R. M. F.; X)

History.—From the standpoint of historical development and population, the Ukraine is composed of two different zones The northern and western parts of the Ukraine are the ancient territories of the earliest mediaeval Russian state of the 9th through the 13th centuries, having Kiev as its capital and the valley of the Dnieper as its principal economic artery. Those populous and flourishing regions, divided into many small principalities under the suzerainty of the grand dukes of Kiev, were completely devastated by the Mongol invasions of the 13th century. The present-day population of northern and western Ukraine is composed of the descendants of the original population of Kievan Russia reinforced by immigrations from north and west which took place in subsequent centuries during the Lithuanian, Polish and finally Russian domination over the Ukrainian territories.

The people of the eastern and southern Ukraine are for the most part descended from Ruthene immigrants from the north who, to escape the oppression of the Polish and Lithuanian princes and nobles, escaped "to the frontier" where, though nominally under Lithuanian rule, they formed free democratic communities, and came to be known as Cossacks (*q.v.*). The whole Ukraine formed part of the Polish-Lithuanian empire until 1667, when the portion east of the Dnieper was ceded to Russia by the treaty of Andrussovo. The rest was absorbed by Russia at the second partition of Poland, in 1793.

The "Great Russians" regarded the Ruthenes as belonging to the Russian nation, and their language as a mere dialect. Toward the middle of the 19th century, however, there began in the Ukraine a separatist movement, associated with the names of the Ruthene scholar Kostomarov and the poet Shevchenko, of which the political ideal was the union of all the Ruthenes, including those of Galicia, in a Ukrainian nation. This Ukrainophil movement gathered force, and become a very important factor in the politics of eastern Europe, especially after the outbreak of World War I.

The collapse of the Russian empire in 1917, and the downfall of the Habsburg monarchy which followed, seemed to give the opportunity for realizing the Ukrainophil ideal. In March 1917 a formal demand for the recognition of Ukrainian autonomy was made to the provisional government at Petrograd, and on April 19 a Ukrainian national convention met at Kiev to elect a *rada* (council). This took over the government in June, and was recognized by the Petrograd provisional government in August On November 20, contemporaneously with the bolshevik revolution in Petrograd, the *rada* proclaimed a Ukrainian People's republic, the independence of which was accepted in principle by the bolsheviks, who made no objection when the Central Powers agreed to receive the Ukrainian delegates to the conference at Brest-Litovsk and to negotiate with them a separate peace.

In January 1918, however, the situation had altered. A bolshevik government had been set up at Kharkov, and was making rapid headway against the "compromising" Kiev *rada*, and at Brest-Litovsk Trotsky now declared that a separate peace with the Ukraine would involve the breaking-off of the negotiations with soviet Russia The news from the Ukraine was, however, uncertain; the Central Powers were in urgent need of food supplies from southern Russia; and on February 9 they signed a peace treaty with the Ukrainian People's republic. By subsidiary treaties, signed on the 12th, the Ukraine agreed, *inter alia*, to provide supplies of grain, etc., in return for manufactured articles

Meanwhile the Kiev government had been hard-pressed by the bolsheviks and, in March, appealed to the Central Powers for help. German and Austrian troops now marched into and occupied the Ukraine, mainly with the object of securing the stipulated supplies of food, which had fallen far short of expectations. A proclamation of the German General Eichhorn ordering cultivation to be proceeded with, led to a quarrel with the *rada*, which was dissolved by the Germans, who made Skoropadski *hetman* of the Ukraine Violent unrest followed among the peasants, who demanded the restoration of the people's republic, and on July 30 General Eichhorn was assassinated. An armistice had been concluded with soviet Russia in May In November, with the collapse of the Central Powers, there was a movement against the *hetman*, headed by Petliura, a former member of the *rada*. Skoropadski was overthrown, and Petliura and Vinnichenko, ex-president of the people's republic, established themselves as dictators in Kiev, where they proclaimed the union of the Ukraine with the West Ukrainian republic set up at Lwów (Lemberg) by the Galician Ruthenes. This led to a short war with Poland, to whom Galicia had been assigned by the Allied Powers. Petliura marched to the aid of the Lemberg government, which was threatened by

the advance of General Haller's Polish legion from the western front, but was decisively defeated

In Feb 1919 Petliura, driven from Kiev by a bolshevik rising, took refuge with his armed followers in east Galicia and in 1920 joined forces with the Poles against the bolsheviks. Meanwhile, in March 1919, a second Ukrainian Soviet government had been set up, but was dissolved in June, when Denikin's "Whites" took Kharkov. In December, however, the soviet forces recaptured Kharkov and Kiev, Odessa also falling to them in Feb. 1920, and a third Ukrainian Soviet republic was established In May 1920 the Poles, with Petliura's troops, occupied large parts of the Ukraine, including Kiev, but were forced to retire when the Russian soviet army took the offensive (*see* RUSSIA). By the treaty of Riga (Oct. 12, 1920 and March 18, 1921) Poland and Russia recognized the independence of the Ukraine. On Dec. 28, 1920 a Russo-Ukrainian treaty was signed defining relations between the two soviet republics.

During 1921 the Ukrainian Soviet Socialist republic signed separate treaties with Georgia (Jan. 31), Lithuania (Feb. 14), Latvia (Aug. 3), Estonia (Nov. 25) and Italy (Dec. 27); and also, in conjunction with the Russian Soviet Federated Socialist republic, with Austria (Dec. 7). In 1922 a treaty with Turkey was signed (Jan. 2) and, again in conjunction with the R.S.F.S.R., a trade agreement with Czechoslovakia (June 5). On July 6, 1923 the constitution of the Union of Soviet Socialist republics was adopted, of which the Ukraine became a constituent member. In Sept. 1924 the autonomous Moldavian Soviet Socialist republic was formed as part of the Ukraine, and was proclaimed a constituent member of the U.S.S.R. in Aug. 1940. In the fall of 1941 the Ukraine was overrun by the Germans. The Russians applied the scorched earth policy in their retreat. As a result of the Russian summer offensive in 1943, however, the greater part of the republic was reconquered.

Forests.—In former times forest and forested glades covered much of the area, coniferous in the north and west, and oak in the south, and patches of forest still remain, especially in the north-west and in the Kharkov district The beech occurs in a small region west of Kamenets Podolsk. The Pontic steppe is practically treeless and probably never had much forest except along the Dnieper river, where it still extends as far as Kherson and is found in patches south of that town. Forest clearing was going on as early as the time of the Kiev principality. Later the Mongols and Tatars destroyed huge stretches of forest by setting fire to it, partly to provide pasture grounds for their flocks and partly to prevent the Slavs from taking refuge in the forest. In the 16th century the colonizing Cossacks continued the process and also practically exterminated the wild horses, deer and bison.

Finally the intensification of colonization in the 19th century so diminished the forests that by the 20th century only 8% of the Ukraine was under timber, of which 23% was coniferous and 64.6% deciduous. The abundant wild life of the region has disappeared, the saiga antelope has retreated eastward and only rodents, especially field mice and marmots, the plague of agriculture, are abundant. The loss of bird life has increased insect pests, though the locust which once did so much damage, has been exterminated. Destructive use of fine meshed nets, so that young as well as adult fish were caught, has markedly lessened the pike, tench, carp, crucian and shad in the rivers, and the sturgeon and sterlet which formerly swarmed up their lower courses are fast disappearing.

Agriculture and Industries.—Four-fifths of the population are engaged in agriculture, and in spite of the destruction of the years of civil war 1917–21 and the famine of 1921, production in 1926–27 had reached about 90% of the 1913 level and by 1937 the crop area covered 62,002,100 ac. Rapid increase of population has always been a feature of the Ukrainian race. This increase of population in a region of lessened agricultural production and markedly diminished manufacturing output still further impoverished the peasantry, and the two features of agricultural life which have been so marked a result of this fecundity of the race, emigration and seasonal wandering in search of work, still persist. Collective farms consisting of 96% of the whole peasantry have contributed much to the technical improvement of agriculture, especially since the western part of the black soil belt lies within the borders of the republic. The climate and soil are particularly favourable to agriculture.

After the revolution and famine also, there was a change in the type of cultivation. Maize, which is a more drought-resisting grain, now occupies more than twice the share of 1913, and rye, potatoes, sunflower seed, hemp, grasses and cultivation of melons, watermelons and cucumbers are markedly above the 1913 level Barley, wheat and sugar beet are below that level. In 1937 unirrigated cotton plantations covered an area of 553,280 ac. The many-field system rapidly replaced the three-field system, artificial manures were increasingly used, and mechanical traction in place of the former reliance on horses and oxen slowly made its way; the peasants in many cases combined to purchase more up-to-date agricultural implements; here, as elsewhere in Russia, the demand for such implements exceeded the supply. In good years a surplus of grain for export is produced, but in drought years there is insufficient grain for the needs of the population.

Stock raising is important, especially sheep and pig breeding. Meat, leather and wool are exported. Communal farms and artels increased and paid special attention to improving the breeds of animals. The most important communal agricultural enterprise is the sugar trust which farms 1,235,000 ac.

The manufactures depending on agricultural products in pre-World War I times occupied a smaller share than metal manufactures, but by the 1920s they surpassed them; the depression of the metal trades and the more rapid return to normal conditions of food products, leather goods and textiles was a common feature in most of the countries affected by the 1914–18 war. This was partly due to the more complex nature of the laws of demand and supply in metal industries and partly to the greater initial capital needed for construction and repair of plant. Flour milling is everywhere important, especially near the Black sea ports and macaroni production has increased. Sugar after refining diminished markedly during the disturbed conditions of 1917–22, the peasants giving up sowing of sugar beet in their need for food grains. In 1925 and later years, however, a revival set in. Oil-pressing, brewing, distilling and tobacco manufactures are important A marked post-revolution feature was the development of leather preparation and the manufacture of leather goods and textiles, previously peasant industries, on factory lines. Smaller agricultural occupations are vine growing, fruit cultivation and beekeeping. Apples, pears and cherries are produced in the north and apricots, almonds and peaches in the south. A recent development is the cultivation of *kenaph*, which is replacing jute in the manufacture of sacking

Minerals.—Of the mineral wealth, rock salt from Artemovsk (Bakhmut) and salt from the *limans* of the Kherson region have long been exploited, salt from the latter district being an article of trade in the earliest days of Kiev. Before the railways were built, the *Chumak*, or drivers of oxcarts, in which dried fish and salt were carried from the Black sea to all parts of the Ukraine, and exchanged for grain, were a noted organization Ox-cart transport is still the only available method in rural districts remote from the railway, the roads being too poor for motor transport. In 1928 a society for road improvement was formed and a "road week" on U.S. lines was planned to encourage local councils to provide roads suitable for motor transport.

The coal of the Donetz region began to be exploited in the latter part of the 19th century; it includes good anthracite beds. The production of coal in 1938 amounted to 88,991,986 short tons—about 60% of the entire coal production of the U.S.S.R. The important Krivoi Rog iron region was first developed about 1880 but of the Krivoi Rog ore there were produced in 1938 17,713,961 short tons of metal, 59% of the entire U.S.S.R. production. Manganese production from the Oligocene strata of the Nikopol region reached (in 1937) 1,054,902 short tons. Phosphorite beds are worked in the west, and graphite north of Dniepropetrovsk The mercury and copper of the Donetz are little worked. Good pottery clays are found everywhere, fireproof clays in the Donetz, slate near Dniepropetrovsk, lithographic stone in Podolla and mineral paints in the Donetz, Krivoi Rog and Kherson districts. Building stone, lime, chalk and gypsum (yielding alabaster) are

also found.

Among industries depending on mineral wealth, smelting occupies the first place. Engine construction, the manufacture of machinery and agricultural implements, steamer building, cycle, motor and aeroplane construction developed in the republic.

Electrification proceeded rapidly. The Shterov station in the Donetz region, working on anthracite dust, was opened in 1925–26 and has a capacity of 20,000 kw., that at Artemovsk (1928) 22,000 kw., and others have been opened. The great dam across the Dnieper, the Dnieprostroy, completed in 1932 with immense hydroelectric installations, was destroyed by the Russians in Aug 1941 when the German army occupied this part of the Ukraine. Cement, aluminum and ferromanganese factories were constructed near the falls to work on electricity The export trade of the Ukraine is mainly grain and flour, as in pre-World War I times, and it still fluctuates in dependence on meteorological conditions, though the famine of 1921 led to much more careful selection of drought-resisting plants.

Transport.—The network of railways is well developed in the Donetz region, and there are several east-west and north-south lines; several new lines have been opened and others are under construction. Air transport developed, the first route being opened in 1925 Regular air services link Moscow, Kharkov and Odessa, with stops at Poltava and Kiev if desired and from Odessa, a regular service goes to Batum. The total length of railway in 1931 was 8,406 mi and the navigable rivers 1,739 mi. The Black sea ports form a trading outlet for the Ukraine. Odessa (*q.v.*) is the most important, others are Nikolayev, Kherson, Mariupol and Berdiansk (*qq.v.*). There are regular services to the Mediterranean and Vladivostok and there is much coastal trade.

Population.—The Ukraine includes within its borders about 20% of the total population of the U.S.S.R., and is one of the most densely peopled regions in Russia, averaging 144.2 inhabitants per sq.mi , more than 60% of whom are occupied in agriculture The village settlements are large and, as a rule, are situated on the high and often precipitous banks of streams so as to be safe from the spring floods, and they form almost continuous belts along the higher right bank of the rivers. The watersheds are less settled.

In respect of the percentage of people living in towns, the Ukraine occupies third place in the republics of the U.S.S.R , the Transcaucasian federation coming first and White Russia second. The town population is, however, increasing rapidly, the Ukraine being in a transition stage toward industrialization. The six largest towns are Kiev (846,293), Kharkov (833,432), Odessa (604,223), Dnepropetrovsk (500,662), Stalino (462,395) and Nikolayev (167,108) (*qq v.*) Kiev is the real heart of the Ukraine, "the mother of cities" to the Ukrainians, foremost still in population and in its ancient culture dating back to the foundations of the Slav dominion in Russia. The site has been occupied since the dawn of history, and Aurignacian remains have been discovered Of the whole population, about 80% are Ukrainians (Little Russians), 9% Russians and 5% Jews, other nationalities represented being Poles, Germans, Moldavians, Greeks, Bulgarians and White Russians. The percentage of Russians in the towns rises to 25%, but is small among the agricultural population.

The Ukrainians are broad-headed, tall, long-limbed and broad-shouldered As a rule they are dark-haired and dark-eyed, and have broad faces, bright complexions and straight noses, though here, as elsewhere there has been racial intermixture and light and medium colouring often occurs. Their language began to be differentiated from Great Russian even in the 11th century, and the wedge thrust between the two peoples by the Tatar domination and the subsequent subjection of the Ukraine to Lithuanian and Polish rule emphasized the divergence.

The use of Great Russian in schools and in printed works was a contributory cause of the illiteracy of the Ukrainian peasant. Ukrainian is the official language of the republic and a keen appreciation of the linguistic freedom resulted in marked development of education, the Ukraine taking a high place in the U.S.S.R. in the provision for education, though here, as everywhere in Russia, many children still receive no education. Kiev, Kharkov and Odessa have scientific and educational institutes and the museums and art galleries of Kiev are famous

UKRAINIAN LITERATURE. The Ukrainians are the descendants of the South Russians of the Kiev period, and have consequent claims to regard the Russian literature of the 11–13th century as Ukrainian. But as the literary tradition was preserved only in Muscovy, the period is treated under RUSSIAN LANGUAGE AND LITERATURE. There is a gap between the last South Russian chronicles of the 13th century and the Ukrainian revival of the 16th, the language of the latter being as different from that of the former as early Middle English is from late Anglo-Saxon

The Ukrainian literature of the 16–17th century is entirely dominated by the national and religious struggle against Rome and Poland. In its early stages it had its centre in Galicia and Volynia, and produced a polemist of genius in Ivan Vyshensky (*fl.* 1586–1620). Later it became centred in Kiev, and under the influence of Peter Mohila, metropolitan of Kiev (1596–1647), borrowed Latin methods to fight the Latins. The writers of the period were polemists, rhetoricians and grammarians; they also wrote verse and plays after Latin school models. Some of the early 18th-century interludes in the latter are of interest. In the later 17th and 18th centuries Ukraine was drained of its best intellectual forces, which were attracted to Muscovy, where the church from 1700 to 1760 was dominated by Ukrainian prelates. After 1750 the Ukrainian gentry began to be rapidly Russianized, many of them attaining to eminence in Russian letters (*e.g.*, Gogol, *q.v.*). Of those that remained Ukrainian the most remarkable was the wandering philosopher and "Christian epicure," Gregory Skovoroda (1722–94). The language used during this period was a mixture of Ukrainian, Church-Slavonic, Polish, and in the later 18th century, Great-Russian elements.

Ukrainian folklore is very rich and original. The best-known type of songs are the so-called *dumy* (collections by Antonovich and Drahomanov, 1874–75; Catherine Hrushevska, part i, 1927) They have an historical background (the Cossack wars of the 17th century), but they are elegiac rather than narrative. There is also a great variety and wealth of the lyrical folksongs. They have had a strong influence on modern Ukrainian literature. The first publications of folksongs by Prince Tsertelev (1819) and Maksimovich (1827) were important landmarks in the first stages of the modern Ukrainian revival.

Modern Ukrainian literature dates from Ivan Kotlyarevsky (1769–1838). His *Travesty of the Aeneid* (1798) and his comedy *Natalka of Poltava* (1816) are closely related to the Russian literary tradition, but the use of the vernacular was a new departure. The successors of Kotlyarevsky did not rise above the level of a provincial *Heimatkunst*. A new spirit was introduced by Taras Shevchenko (1814–61). He was born a peasant and a serf, a fact that emphasizes the essentially democratic and rural character of modern Ukrainian literature. A romantic nationalist in his early, a revolutionary internationalist in his later work, Shevchenko had deep roots in Ukrainian folklore He has become the symbol of Ukrainian nationality. His younger contemporary Marko-Vovchok (pseudonym of Marie Markovich, *née* Velinsky, 1834–1907), a Great Russian by birth, wrote stories of peasant life which have made her a standard of good Ukrainian prose

The persecution of the Ukrainian movement in Russian Ukraine, culminating in the practically prohibitive decree of 1876, favoured its growth in Galicia, where such scholars as Michael Hrushevsky (1866–1934), an *émigré* from Russia and Ivan Franko (1856–1916) made of Lwow the centre of Ukrainian culture. Franko was also the most remarkable Galician novelist of the period. In Russian Ukraine the most outstanding writers were the poetess Lesya Ukrainka (pseudonym of Larissa Kvitka, *née* Kossach, 1872–1913) and the novelist Michael Kotsyubinsky (1864–1913).

BIBLIOGRAPHY.—In Ukrainian: S Yefremov (Efremov), *History of Ukrainian Literature* (1911); Doroshkevych, *Manual of Ukrainian Literary History* (1927). The *History of Ukrainian Literature* of M *Hrushevsky* (1923 *seq.*) has, with its sixth part, reached the middle of the 16th century It includes many chapters on folklore For a concise survey in a western language: Comte M. Tyszkiewicz, *La Littérature Ukrainienne* (Berne, 1919); M. Hrushevsky, *Anthologie de la*

Littérature Ukrainienne (1921). (D. S. M.)

UKULELE. A small guitar (*q.v.*) used by the natives of the Hawaiian Islands and adopted as a jazz and solo instrument in England and the United States.

ULAN (*Uhlan*), originally a Polish lancer. The Ulans were cavalry and wore the national dress and czapka (or lancer cap). They were first introduced into the Prussian army in 1740, but failed to distinguish themselves in the first Silesian War, and it was only after the Treaty of Tilsit (1807) that Ulan regiments were again formed in the Prussian army. In the German army the old Ulan regiments have been represented in most cavalry regiments by at least two squadrons. In the Austrian army a "Uhlanpulk" of Poles was formed in 1784 and ordinary Uhlan regiments of Austrian cavalry in 1791. In the Polish army there are a number of Uhlan regiments.

ULAN BATOR ("red knight"), previous to 1921 called Urga (from Orgo-palace), capital of Outer Mongolia, on an affluent of the Tola river. It was the holy city of the Mongols and the residence of the "living Buddha," metropolitan of the Kalka tribes, who ranked third in degree of veneration among the dignitaries of the Lamaist Church.

In 1920, White Russians under the "mad baron" Ungern-Sternberg occupied Urga. After defeating them, 1929, Soviet Russia remained in control of Urga and Outer Mongolia, although Chinese suzerainty has been recognized. Urga, as seat of the government of the Russian-sponsored People's Revolutionary party, was renamed Ulan Bator. When in 1924 the living Buddha died, reincarnation was not permitted, and the palace became a museum. Formerly 13,000 of the city's 85,000 people were lamas; in 1939 theoretically no lamas remained. The two representative bodies, the great and small khuruldan, meet in Ulan Bator. In 1932 a magnificent theatre was opened, with revolving stage and several thousand seats. Ulan Bator has also a radio station, several papers and magazines, high schools, a university, veterinary college, medical school and a military school with Russian advisers.

ULAN UDE (formerly Verkhne-Udinsk), a town of Asiatic Russia, the capital of the Buriat-Mongol A.S.S.R. It is on the Uda river, at its confluence with the Selenga, and has steamer communication with Lake Baikal, and southwards with Mongolia. It is also on the Siberian railway, and grew markedly after the railway was constructed in 1905. The climate is extreme, average July temperature 66.2°, Jan. −17.3° F. The water supply to the railway in winter is a difficulty, since the ground is frozen and water pipes cannot be buried below frost level. Pop. (1939) 129,417. The town was on the 18th-century military Siberian road and was formerly a great centre for the tea trade from Mongolia via Kiakhta. (*See* TROITSKOSAVSK.)

ULCER. An ulcer is a lesion of the skin or any mucous membrane characterized by a loss of the surface epithelium and more or less of the underlying connective tissue. The term is also applied to lesions of the aorta and the valves of the heart in which there is a loss of the lining endothelium. An ulcer has a depressed floor or crater surrounded by sharply defined edges which are sometimes elevated above the level of the adjoining surface. The floor of an ulcer is formed by granulation tissue which is usually infected from bacterial contamination. Since many ulcers are cancers it is most important to the patient to know whether the ulcer is benign or malignant (cancerous). Benign ulcers are usually caused by infections or by nutritional disturbances. The ulcers on the legs of persons with varicose veins are caused by the slow circulation of the blood in the skin. Any infection under the skin such as a boil, a carbuncle or a tuberculous lesion may break through the surface and form an inflammatory ulcer. The significance of an ulcer is best explained by a separate consideration of the different regions of the body in which ulcers develop. When an ulcer of the skin has been present for a month or longer the possibility of cancer must always be considered. If the edges of the ulcer are hard and the patient is past middle life, the probability of cancer is still greater. Ulcers on the vermilion border of the lower lip in elderly men are nearly always cancers. Women rarely develop cancer of the lower lip. Such cancers must be recognized and treated early before they spread and become inoperable The superficial ulcers on the lips, the ordinary "cold sores," are caused by a virus and are of no serious significance

Ulcers in the mouth and throat are frequently caused by infection but are more often cancerous, especially in older individuals. The malignant ulcers usually have hard edges. In diphtheria there is often extensive ulceration of the throat. Ulcers in the oesophagus are nearly always cancers.

Peptic ulcer refers to an ulcer in the part of the intestinal tract bathed by the gastric julce; *i e*, the stomach and the first segment of the duodenum. *Ulcers do not occur* in the duodenum below the ampulla where the alkaline bile and pancreatic secretion enter and neutralize the gastric acid.

Peptic ulcer is a common disease of unknown cause Ulcers in the duodenum are four or five times as frequent as ulcers in the stomach. The patient has pain or distress of some kind in the epigastric region which is related to the time of eating and the kind of food taken Peptic ulcers may bleed into the intestinal tract causing the appearance of tarry stools and the development of anaemia. A large haemorrhage may be fatal. The ulcer may perforate, admitting the intestinal contents into the peritoneal cavity, causing peritonitis. Ulcers in the stomach are frequently cancers but those in the duodenum are rarely malignant. Peptic ulcers in younger persons may usually be controlled or cured by dietary management, but in older individuals peptic ulcers are less responsive to medical management and may require surgical intervention At mid-20th century a majority of surgeons favoured a total or subtotal gastrectomy for intractable peptic ulcer. This operation removes the greater part of or all the gastric mucous membrane which secretes acid Acid plays an important role in the causation of peptic ulcer.

Ulcers in the small intestine occur chiefly in the terminal portion not far from its entrance into the large bowel The most frequent causes of ulcers in the terminal ileum are typhoid fever and tuberculosis In the large bowel single large ulcers are usually cancers. Cancerous ulcers are most frequent in the rectum but may develop in any part of the colon. They cause pain, constipation and blood in the faeces. They are highly malignant cancers and can be successfully removed only when recognized in an early stage Ulcerative colitis refers to a disease in which hundreds of small ulcers develop in the mucous membrane of the large intestine. Some cases are caused by amoebic dysentery and some by bacillary dysentery but in the majority of cases no cause can be established. The cases of unknown causation are the most difficult to treat and it is sometimes necessary to remove the entire large intestine

Ulcers developing in the urinary bladder may be inflammatory or cancerous in nature. Cancers of the bladder are highly malignant and few cures are effected.

Ulceration of the valves of the heart occurs in bacterial endocarditis Bacteria, usually streptococci, lodge in the valve leaflets and produce an inflammation which destroys the surface of the valves and makes an ulcer. This disease was almost invarnably fatal before the introduction of penicillin, but many cases of bacterial endocarditis have been cured by penicillin.

(E T. Be.)

ULEABORG: *see* OULU.

ULEMA, the learned of Islām, theologians, canon-lawyers, professors, judges, muftis, etc., all who, whether in office or not, are versed theoretically and practically in Moslem science in general. (Arab. *'ulamā*, sing. *'ālim*, literally, "knowers," in the sense of *scientes*.) By "science" in this case is especially meant what is learned from tradition, books or men, and through the intellect. In a narrower sense, Ulema is used, in a Moslem state, of a council of such learned men, holding government appointments. If all conception of intermediary priesthood be eliminated, the Ulema may be said to be equivalent to the secular clergy of Roman Christendom (*see* DERVISH). Opposed to them, again, are the *'ārifs* ("knowers," "perceivers," *sentientes*, as opposed to *scientes*), to whom religious knowledge comes in the vision of the mystic, not by tradition or reason (*see* SŪFĪISM).

ULFILAS (*c.* 311–383), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths at the trans-Danubian provinces about the year 311.

The Arian historian Philostorgius (*Hist. eccl.* ii, 5) says that his grandparents were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 264, and became so naturalized that the boy received a Gothic name, *Wulfila* (Little Wolf). An authoritative record of the outlines of his life was only discovered early in the 19th century in a writing of Auxentius of Milan, his pupil and companion. At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople,

But here probably he came into contact with the Arian doctrines which gave the form to his later teaching. For some time before 341 he worked as a lector (reader of the Scriptures). From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with him," probably at Antioch, in 341.

He was now 30 years of age, and his work as "bishop among the Goths" covered the remaining 40 years of his life. For seven of these years he wrought among the Visigoths beyond the Danube, till the success which attended his labours drew down the persecution of the still pagan chief of the tribe To save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people With the consent of the emperor Constantius he led them across the Danube, "a great body of the faithful," and settled in Moesia at the foot of the range of Haemus and near the site of the modern Trnovo (349).

The life of Ulfilas during the following 33 years is marked by only one recorded incident (Sozomen iv, 24), his visit to Constantinople in January 360, to attend the council convened by the Arian or Homoean party. The part played by Ulfilas in these troublous times cannot be ascertained with certainty. It may have been he who, as a "presbyter christiani ritus," conducted negotiations with Valens before the battle of Adrianople (378); but that he headed a previous embassy asking for leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen—these and other similar stories of the orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. In 383 he was sent to Constantinople by the emperor. A split seems to have taken place among the Arians at Constantinople. Ulfilas was summoned to meet the innovators, and to induce them to surrender the opinion which caused the dispute. No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him he died, probably in January 383.

The Arianism of Ulfilas was a fact of pregnant consequence for his people, and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own confession—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position, and vigorously opposed the teaching of his former leader. He appears to have joined the Homoean party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum, with the addendum that in future the terms ὑπόστασις and *obvla* should be excluded from Christological definitions. Thus we learn from Auxentius that he condemned Homoousians and Homoiousians alike, adopting for himself the Homoean formula, "filium similem esse patri suo."

His version of the Scriptures is his greatest monument. By it he raised a barbarian tongue to the dignity of a literary language; and the skill, knowledge and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work. For the linguistic value of the Gothic version of the Scriptures by Ulfilas *see* GOTHS: *Gothic Language*. It is preserved, though only in a fragmentary form, in the famous *Codex Argenteus* at Uppsala This ms., discovered at the monastery of Werden, near Cologne, was deposited at Prague, carried off by the Swedes in 1648 and presented to Queen Christina. From Stockholm it passed by some means into the hands of Isaac Vossius, and a transcript was made and published by Franciscus Junius in 1655. The ms. was bought by the count de la Gardie and presented to the university of Uppsala. Its uncial letters are formed in silver on a surface of purple vellum.

ULIANOVSK (formerly Simbirsk), a town in the Kuibyshev region, Russian S.F.S.R., founded in 1648, lying on a hill 560 ft. above the Volga at a point where the Svyaga closely approaches it, in 54° 23′ N., 48° 25′ E Pop (1939) 102,106. Its suburbs extend to the Svyaga and to the Volga Suburbs on the left bank of the Volga are cut off from communication during the spring and autumn, but are reached by boat in summer and sleigh in winter. The town has a brisk river trade and has sawmills, flour mills, breweries, distilleries and brickyards. It has railway communication across the Volga and with the west. The historian Karamzin was born here in 1766 and Lenin in 1870. Ulianovsk was the scene of much fighting during the civil war of 1917–1920.

The former province of Ulianovsk was divided among the Gorki, Penza and Kuibyshev regions and the Tatar A.S.S.R. and Chuvash A.S.S.R.

ULM, a city of Germany, in the *Land* of Württemberg, situated on the left bank of the Danube, at the foot of the Swabian Alps, 58 mi S E of Stuttgart by rail and 63 mi N.W. of Munich. Pop. (1939) 75,503. Ulm is mentioned as early as 854; it became a town in 1027, and was soon the principal place in the duchy of Swabia. Although burned down by Henry the Lion, it soon recovered from this disaster and became a free imperial town in 1155. Its trade and commerce prospered and in the 15th century it attained the summit of its prosperity, ruling over a district about 300 sq.mi. in extent, and having a population of about 60,000. In 1803 it lost its freedom and passed to Bavaria, being ceded to Wurttemberg in 1809. In Oct. 1805 General Mack with 23,000 Austrians capitulated here to Napoleon. Ulm is remarkable in the history of German literature as the spot where the Meistersingers lingered longest, preserving without text and without notes the traditional lore of their craft.

Ulm still preserves the appearance of a free imperial town, and contains many mediaeval buildings of historic and of artistic interest. Among these are the town hall, of the 16th century, in the Transition style from late Gothic to Renaissance, restored in recent years; the Kornhaus; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; and the commandery of the Teutonic order, built in 1712–18 on the site of a habitation of the order dating from the 13th century, and now used as barracks. The magnificent early Gothic cathedral, begun in 1377, and carried on at intervals till the 16th century, was long left unfinished, but in 1844 the work of restoration and completion was begun, being completed in 1890. It has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 ft., its breadth 159 ft.; and the aisles are covered with rich net-vaulting. The tower in the centre of the west façade was completed in 1890, and is of the loftiest ecclesiastical erection in the world (528 ft.). The cathedral contains some fine stained glass, and a number of interesting old paintings and carvings. It belongs to the Protestant Church.

The Danube, joined by the Iller just above the town and by the Blau just below, here becomes navigable, so that Ulm occupies the important commercial position of a terminal river-port. There is water communication with the Neckar, and so to the Rhine The market for leather and wool is important, and the manufactures include wire ropes, borax, paints, cheese, jute, leather, lace, perfumes and cement Brewing and weaving, iron- and brass-founding are carried on as well. As a fortress Ulm has been famous and it is a garrison town.

Nübling, *Ulms Handel und Gewerbe im Mittelalter* (Ulm, 1892–1900); G Fischer, *Geschichte der Stadt Ulm* (Stuttgart, 1863); Pressel, *Ulmisches Urkundenbuch* (Stuttgart, 1873); and *Ulm und sein Munster* (Ulm, 1877); Schultes, *Chronik von Ulm* (Stuttgart, 1881 and 1886); Hassler, *Ulms Kunstgeschichte im Mittelalter* (Stuttgart, 1872); and *Das rote Buch der Stadt Ulm*, edited by C. Mollvo (1904)

ULMACEAE, a family of dicotyledonous trees, the best known and most important members of which are the elms (*q.v.*), forming the genus *Ulmus*. The family contains 13 genera and

about 130 species. *Celtis australis* is the nettle-tree, the fruit of which is edible. *C. occidentalis* is the hackberry (*q.v.*).

ULMANIS, KARL (1877–), Latvian statesman, first prime minister and organizer of the independent republic of Latvia. Born Sept. 4, 1877, in Zemgale (Courland). He was an agronomist. He also studied agriculture in Germany and the United States of America, and, before Latvia became an independent state, he gave many lectures in Latvia on agricultural questions. He was an active supporter of the movement to liberate the Latvian people from Russian and German domination. After the Allied victory of 1918, when Latvia was still occupied by German military forces, he organized all political parties in Latvia around the Democratic block, which later in the same year, united with other political organizations of Latvian refugees in Russia, became the Latvian national council. On behalf of this national council and in the name of the Latvian nation, the independence of Latvia was proclaimed on Nov. 18, 1918, and K. Ulmanis was appointed first prime minister of the interim Latvian government. Under his leadership the young state waged its fight for freedom against the Russian Bolsheviists and the combined German and Russian irregular forces, *i.e.*, the Bermondt army.

After the Latvian army's complete victory, K. Ulmanis led his country until the constituent assembly was elected and gave the country a constitution. Peace was concluded with Russia and Germany, and the young state concentrated all its force on the reconstruction and building up of the administration.

Ulmanis was prime minister from Nov. 18, 1918, to June 18, 1921, when a coalition government was formed by his party colleague, Z. Meierovics. He was again prime minister from Dec. 24, 1925, to May 5, 1926; from March 1931 to Dec 1932, and in May 1934 he assumed the office once more, dissolved the Saeima (parliament) and became dictator. On April 11, 1936, he was also named president. He remained head of the state until it was absorbed into the U.S.S.R in July and Aug. 1940. During the upheavals that attended this union Ulmanis's death was reported, but he was later reported living in the U.S.S.R.

ULPIAN (DOMITIUS ULPIANUS), Roman jurist, was of Tyrian ancestry. His literary activity lay between 211 and 222. He made his first appearance in public life as assessor in the *audutorium* of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests (*magister libellorum*). Heliogabalus banished him from Rome, but on the accession of Alexander (222) he was reinstated, and finally became the emperor's chief adviser and *praefectus praetorio*. His curtailment of the privileges granted to the praetorian guard by Heliogabalus provoked their enmity, and he narrowly escaped their vengeance; ultimately, in 228, he was murdered in the palace, in the course of a riot between the soldiers and the mob.

His works include *Ad Sabinum*, a commentary on the *ius civile*, in over 50 books; *Ad edictum*, a commentary on the Edict, in 83 books; collections of opinions, responses and disputations; books of rules and institutions; treatises on the functions of the different magistrates—one of them, the *De officio proconsulis libri x.*, being a comprehensive exposition of the criminal law; monographs on various statutes, on testamentary trusts, and a variety of other works. His writings altogether have supplied to Justinian's *Digest* about a third of its contents, and his commentary on the Edict alone about a fifth. As an author he is characterized by doctrinal exposition of a high order, judiciousness of criticism, and lucidity of arrangement, style and language.

Domitii Ulpiani fragmenta, consisting of 29 titles, were first edited by Tilius (Paris, 1549). Other editions are by Hugo (Berlin, 1834), Böcking (Bonn, 1836), containing fragments of the first book of the *Institutiones* discovered by Endlicher at Vienna in 1835, and in Girard's *Textes de droit romain* (Paris, 1890).

ULRIKE, queen of Sweden, born in Berlin, the daughter of King Frederick William I of Prussia and Sophie Dorothea of Hannover, was educated like her brothers and sisters by the same French governesses and tutors. She was her father's favourite, and he made her coadjutor of Quedlinburg in 1738. Her marriage to Adolf Friedrich, Crown Prince of Sweden, was arranged through Empress Elizabeth of Russia. Frederick II would have preferred to have his youngest sister, Amalie, the future Queen of Sweden. In 1746 her son was born. Ulrike was the leader of the "court-party" after a break with her former trusted friend, Count Tessin, in 1750. Frederick II constantly urged her to be more cautious, more moderate. He refused a loan to her, which she needed for political bribes. She was involved in the abortive "coup d'état" of 1756, and unable to prevent the war with Prussia. But the disastrous course of the war strengthened her position and she was instrumental in arranging peace feelers in 1762. Following her husband's death, early in 1771, she visited in Berlin until 1772, and there Frederick II tried to help her in her increasing difficulties with her son, now King Gustaf III, whom she wanted to advise but whose response was not cordial.

Resembling her brother Frederick II in many respects, she encouraged arts and science, befriended Linnaeus (*q.v.*) and invited Voltaire to settle in Sweden. In 1753 she founded the Royal Academy for Art and Science but did not admit to its fold the most educated Swede of his time, Count Tessin, her former friend, now her political enemy.

Ulrike's letters to her family and well written memoirs have much in common with those of her sister Wilhelmine, but, though partial, are far more reliable. She was a promoter of French cultural influence in Sweden, and in her political aims to abolish the existing constitution and the venal feudal rule, both a follower of her father and a predecessor of her son, though lacking their determination and concentrated will power. Her last years were darkened by the antagonism to her son.

ULSTER, EARLS OF. The earldom of Ulster was the first title of honour in Ireland of English creation, and for more than a century was the only one. It dates from a grant to de Lacy in 1205.

Hugh de Lacy, 1st Earl of Ulster (d. 1242?), was descended from Walter de Lacy (d. 1085), who fought for William the conqueror at Hastings. The first earl was the brother of Walter de Lacy (d. 1241), who succeeded his father as lord of Meath in 1186. In 1203 Hugh de Lacy drove John de Courci out of Down, and was rewarded by grants of land, and in 1205 by the earldom of Ulster. He was then invested with quasi-viceregal authority, but in 1207 war broke out between the earl and the king's justiciar. King John came to Ireland, and banished the earl to Scotland. He returned to Ireland in 1226, and died at Carrickfergus. On his death the earldom reverted to the crown.

Second Creation.—Prince Edward (afterwards Edward I), transferred "the county of Ulster" (*c.*1255), to Walter de Burgh, lord of Connaught. The earldom remained in the family of de Burgh until the death of William, 3rd earl of this line, in 1333, when it passed to his daughter Elizabeth, who married Lionel, afterward duke of Clarence, son of Edward III. Lionel was succeeded in the earldom of Ulster by his daughter Philippa, who married Edmund Mortimer, earl of March. The third Mortimer, earl of Ulster, died unmarried in 1425, when his titles were inherited by Richard Plantagenet, duke of York, whose son Edward ascended the throne as Edward IV in 1461.

Since that date the earldom of Ulster, which then merged in the crown, has only been held by members of the royal family. In 1928 it was bestowed upon H.R.H. the Duke of Gloucester.

See, for the de Lacy and de Burgh earls of Ulster, *The Chronicle of Florence of Worcester*, edited by T. Forester (1854); *Annals of Ireland by the Four Masters*, edited by J. O'Donovan (7 vols, Dublin, 1851); *The Annals of Loch Cé*, edited by W. M. Hennessy, "Rolls Series" (2 vols, 1871), *Calendar of Documents Relating to Ireland*, edited by H. S. Sweetman (5 vols., 1875–86); W. W. Shirley, *Royal and Historical Letters of the Reign of Henry III*, "Rolls Series" (2 vols., 1862–66); Sir J. T. Gilbert, *History of the Viceroys of Ireland* (Dublin, 1865). For the later history of the earldom *see* G. E. C., *Complete Peerage*, vol. viii (1898).

ULSTER, a province of Ireland occupying the northern part of the island. By the Government of Ireland act, 1920, six of the province's nine counties of Donegal, Londonderry, Antrim, Fermanagh, Tyrone, Cavan, Monaghan, Armagh and Down (*qq.v.*) became grouped under the separate government of Northern Ireland (*see* IRELAND, NORTHERN) which was established. the new area being frequently styled the "Six Counties." Ulster

(*Uladh*) was one of the early provincial kingdoms of Ireland but by A.D. 400 became divided into three states, Oriel (Oirghialla) in the south, Ulidia in Antrim and Down, and Aileach or Tir Eoghan in the north. The O'Neills of Tir Eoghan became dominant over all Ulster, but after the Norman invasion Ulidia fell to John de Courcy, while Oriel was partitioned. In the 15th century English rule practically disappeared from Ulster which, under the O'Neills and O'Donnells became the most Gaelic province of Ireland and found two great champions of native independence in Shane and Hugh O'Neill, Earl of Tyrone, whose grandfather Conn had accepted this English title in 1543. With the suppression of Tyrone (1603) the province was subjected to the crown, and the Flight of the Earls (1607) gave the opportunity for the plantation of Ulster by English and Scottish settlers (*see* PLANTATION).

ULTIMATUM is a technical diplomatic term, derived from the Latin word for "last." It signifies a formal, categorical declaration, addressed by one state to another, to the effect that if certain demands are not met, serious consequences will ensue. These consequences may range from the rupture of the particular negotiations, economic measures, breaking-off of diplomatic relations or threat of force, to the actual application of force in the form of war.

An ultimatum is called simple if it does not indicate the measures to be taken by the government sending it. It is called qualified if it indicates the nature of the measures to be taken Article i of convention iii, adopted by the second Hague conference (1907), regulates in detail the formalities to be observed with regard to an "ultimatum with a conditional declaration of war." The practical importance of these provisions was greatly diminished by the provisions of the covenant of the League of Nations and of the charter of the United Nations, limiting the right of the member states to use war as an instrument of national policies. It was also diminished by the disregard with which many states treated these provisions.

Diplomatic history abounds with examples of ultimatums. Thus on Aug. 4, 1914, the British ambassador, Sir Edward Goschen, submitted to the German foreign minister, Gottlieb von Jagow, a written statement that, unless Germany would give assurances by midnight that it would proceed no further with the violation of Belgian neutrality, the British government felt bound "to take all steps in their power to uphold the neutrality of Belgium." Again, on Sept. 3, 1939, at 9 A.M., the British ambassador, Sir Neville Henderson, informed the German government that, unless the German government would give assurances to the British government by 11 A.M. of the same day concerning the suspension of all aggressive action against Poland, a state of war would exist between the two countries as of that hour.

(H. J. MU.)

ULTIMOGENITURE, the custom by which the youngest son inherits the homestead, is known in English law as Borough English. In England it obtained in parts from Gloucester to Cambridgeshire. Under the name of Mainète and Jungerrecht it was known in northern France and northern Germany. In Assam it is found among the matrilineal Garos who possess the dual organization and speak a Tibeto-Chinese language, among the matrilineal Khasias who speak an Austric language, among patrilineal Lusheis, Meithels, Nagas and Kachins, speakers of Tibeto-Chinese languages. Cases are known in Africa.

This custom has been regarded as derived from the *jus primae noctis*, the youngest son being of undoubted paternity. This view has been successfully traversed by Blackstone, Westermarck and Frazer. It has been ascribed among settled peoples, such as Nagas and Meithels, to the custom of making provision for the elder sons as they marry and set up house independently. The rule requiring elders to marry before juniors is found among communities which do not now practise ultimogeniture. Among people like the Lusheis, who practise shifting cultivation, it is due to the custom by which the sons of chiefs, on marrying, swarmed off to found new villages The view that it is connected with domestic worship is supported by the Khasi evidence, where the youngest daughter "inherits the religion"—in organic association with the homestead. With the Garos it is inseparably connected with the general system of marriage.

See Blackstone's *Commentaries on the Laws of England*, vol. ii; O. Elton, *Origins of English History*, 1st ed. (1888); E. Westermarck, *History of Human Marriage*, 5th ed.; Sir J. Frazer, *Folklore in the Old Testament* (1918).

ULTRACENTRIFUGE: *see* CENTRIFUGE.

ULTRAMARINE is the colour principle of the gem lapis lazuli (*q.v.*) which, besides its use as an ornament, formed the blue pigment used by painters in the middle ages. Ore containing the colour was ground and the powdered lapis lazuli separated from the other mineral matter by an oil pasting process. The blue pigment so obtained is said to have been literally worth its weight in gold. The fact that the product was imported into Europe gave it its name—ultramarine, "beyond the sea."

The value of the material caused great efforts to produce it artificially and these succeeded in the late 18th of the 19th century. It appeared on the market almost simultaneously in France and Germany. To be sure, the ultramarine of those early days was a weak, poor product from the present point of view, but it was the start of a development leading to the pigment of today.

The present process of manufacture is this: more or less equal amounts of china clay, sulphur and soda ash (sodium carbonate) are taken, together with considerably smaller amounts of silica and rosin or pitch. Variations in the proportions of the ingredients are used to cause variations in the shade of the product from a greenish to a reddish blue. The mixture is very finely ground and loaded into crucibles with porous walls. More than 1,000 of these are stacked in a single furnace, which is then slowly fired up to a top temperature of about 750° F. and complicated reactions occur among the ingredients of the mix. When the top temperature has been reached, the fire is drawn, the furnace sealed and allowed to cool over a period of about two weeks. During this cooling period the atmosphere of the furnace exerts an oxidizing action upon the crucible contents, of much importance to the character of the product. The crude ultramarine is removed from the crucibles, is washed free from salts, very finely ground and separated by successive sedimentations from water suspension into a series of particle sizes. The varying characteristics required for different uses of ultramarine are satisfied by selection of the desired shade and particle size. For some purposes, the product requires further special surface treatments.

The main fields of use of ultramarine are paints and lacquers, calcinine, linoleum, paper both in whitening and colouring, coloured roofing material, laundry blueing. It has a particularly brilliant blue colour, is very light-fast and is resistant to not too strong alkali, but not to acids. The structure of ultramarine was a matter of much controversy until F. M. Jaeger finally settled the matter in 1929 by the use of the X-ray. Ultramarine, or better, the ultramarines, consist of a framework or lattice of cubical form with truncated corners, built up of aluminum and silicon atoms joined to one another through oxygen atoms. The ratio of aluminum to silicon atoms can vary within limits, but their combined number is always 12. Commonly the silicon atoms outnumber the aluminum atoms. The connecting oxygen atoms number 24. Within the lattice and in the spaces formed by the truncated corners of adjacent lattices are atoms of sodium and sulphur not rigidly fixed as to number or position.

It will be clear from the above why there is a family of ultramarines and why variations in composition exist The usual percentage limits within which the components fall are the following:

Silicon	17.75	to 20.0%	by weight
Aluminum	12.3	to 15.5%	by weight
Sodium	12.8	to 15.3%	by weight
Sulphur	1.0	to 14.0%	by weight
Oxygen	Balance (except for small amounts of water and impurities)		

The shade and properties of the ultramarines will vary with changes in the proportions of the components. (A. P. B.)

ULTRAMICROCHEMISTRY. The term "ultramicrochemistry" refers to a set of chemical techniques by which chemical analyses and other chemical manipulations are performed on the most minute amounts of material. If a standard analytical method

requires about $\frac{1}{10}$ gram or sample, the micromethod for the analysis would require about $\frac{1}{100}$ gram and the ultramicromethod about $\frac{1}{1000}$ gram. It is less ambiguous, then, to term ordinary scale or macro-operations as "decigram methods," micromethods as "milligram methods" and ultramicromethods as "microgram methods" (1 microgram = 0 000,001 gram = about 0 000,000,035 oz) Microchemistry is then "milligram chemistry" (1 milligram = 0.001 gram) and ultramicrochemistry is "microgram chemistry" It is also termed "drop analysis" because a sample of blood or other solution being analysed is usually less than a drop.

Systematic ultramicrochemistry originated in the Carlsberg laboratory in Copenhagen about 1930. The techniques developed there were used chiefly to analyze traces of enzymes, or biological catalysts, in tiny slices of tissues of plants and animals. The techniques applied to this purpose became known as "enzyme histochemistry." They were widely employed by K Linderstrøm-Lang and his co-workers of the Carlsberg laboratory, as well as by many others, to the solution of fundamental biological problems.

A broader chemical approach was made by Paul L. Kirk and his co-workers at the University of California, starting about 1933. Instead of specific applications to limited types of biological problems, the aim of the California group was to make all kinds of chemical operations practical with microgram quantities, so that any chemical study could be made, regardless of the type of material studied Although the chief applications of these techniques were also expected to be biological in nature, the general applicability was demonstrated when they were used to develop the chemistry of plutonium, the man-made element used as an explosive in the atomic bomb Microgram manipulation was made necessary in this case by the fact that only microgram quantities of plutonium could be made by methods then available, and larger amounts could not be manufactured until extensive chemical information was available. Virtually the entire chemistry of plutonium was elucidated before there was as much as a milligram of the material in existence and the huge production plants were constructed with a scale-up of more than a billionfold—an all-time industrial record.

Up to about 1940, the strictly chemical techniques were largely confined to volumetric operations, *i.e.*, measurement of liquid volumes as a means of analysis. This was true of both the Copenhagen and California groups as well as for several other laboratories in which microgram chemistry was being studied or used. Included in these developments were methods for study of chemical changes through gasometric methods depending on measurement of gas volumes, respiration of single cells and of very small organisms or bits of tissue, enzyme catalysed reactions in droplets and various manipulative techniques. During World War II, further advances occurred in ultramicroweighing, submicrogram chemical analysis through colour measurement and chemical study of reacting systems containing only a few micrograms of material through improved manipulative techniques.

Liquid Volumetric Techniques.—Analytical methods depending on measurement of volumes of liquids were peculiarly adaptable to ultramicroanalysis and were the first techniques developed. Titrations were readily performed with burets made from fine capillary tubes, which delivered small volumes of reagent solutions with an accuracy of ±0 02 microlitres or better (1 microlitre = 0 000,001 litre; 1 litre = approx. 1 quart). Liquid samples were measured with the same accuracy by use of the same fine graduated tubing The blood of a grasshopper, or a droplet from a child's fingertip, could then be measured accurately and its constituents accurately determined by titrating this bit of blood with a capillary buret Operations other than titration usually needed to be done If so, techniques for precipitating down the corpuscles, removing the protein, ashing the blood, filtering it, stirring it or boiling it were developed and could be used without ever having a greater volume than about one drop of liquid. By such means, quantitative analysis for nitrogen, urea, sugar, amino acids, lactic acid, ammonia, chloride, sodium, potassium, calcium, phosphorus and other common constituents of blood could be performed. Adaptations of these procedures are applicable to the analysis of all types of materials other than blood. They can be valuable in the clinical laboratory by avoiding the difficulty of obtaining large amounts of blood from patients; *e.g.*, infants They are useful to the research worker who can study insects, some single cells, small plants and animals and their parts which by common methods could not be analysed at all. They can be used for the study of minute amounts of inorganic material such as the radioactive isotopes obtained by the nuclear physicist. The dangers of radioactivity are less with the small sample, and very often only the smallest samples can be obtained

Gasometric Ultramicromethods.—Methods depending on gas volume changes have been chiefly useful in measuring the respiration rate of cells, tissues and small organisms. Some of these devices have been made sensitive enough to measure the minute trace of oxygen used by single invisible protozoan cells; the most delicate direct instrument used in 1946 was that of B. B. Cunningham and Kirk. Several such instruments could determine the rate of oxygen consumption with slightly larger organisms or tissues One ingenious device which has been widely used both for respiration and enzyme studies is the Cartesian diver micromanometer which was first described by Linderstrøm-Lang.

Gas analysis also was highly developed as an ultramicrotechnique during World War II. Most significant were the methods of P. F. Scholander and his associates who succeeded in analysing as little as ten microlitres of gas mixtures for their constituent gases with approximately the same accuracy as is possible with large samples. These techniques were applied to various physiological studies.

Weighing.—Although very sensitive balances were developed early in the 20th century, little refinement or use had been made of them until 1942. P. L Kirk, Roderick Craig and J. Gullberg succeeded that year in combining earlier weighing principles and refining them in a quartz fibre balance which could carry a total load of about 100 milligrams and weigh a sample of 0 3 milligram with a sensitivity of about 0 005 microgram. A human breath weighs about 750,000 micrograms; a dime, 2,500,000. With little loss in load capacity, the sensitivity could be increased by about tenfold. This instrument for the first time made weighing a practical technique of ultramicroanalysis and opened the way for development of all types of investigation of ultrasmall samples which require weight determination.

Colorimetric Submicrogram Analysis.—Most significant of developments in ultramicrochemistry during World War II was the initiation of submicrogram analysis by means of the spectrophotometer. By using specially designed capillary absorption cells, the sensitivity of the colorimetric methods could be so increased as to allow the accurate analysis of amounts of many materials as low as one or a few millimicrograms (1 millimicrogram = 0 001 microgram = 0 000,000,001 gram). By 1946 little application had been made of this type of technique in practical research work, but the field of application is so broad in all phases of chemistry, biochemistry and biology that developments along this line were expected to outdo all past efforts toward chemical study of the microscopic world.

Miscellaneous Techniques.—The development of fine manipulative methods for separating and handling minute objects, such as the nuclei of cells, has progressed markedly to supplement the quantitative techniques which constitute the foundation of ultramicrochemistry. Improved microscopic methods using fluorescence from ultra-violet light and improved methods of staining certain constituents of cells and tissues for identification purposes have come into use.

For the first time in history, the ultramicrochemist possesses the tools with which he can carry chemical investigations into the cells, the very seat of life processes of plants and animals, and elucidate their nature. He can elaborate the complete chemistry of a new synthetic element before the amount of it on earth is the size of a small pin head He can facilitate or make possible all sorts of research investigations which were completely impossible without these extremely delicate techniques. Medicine, agriculture, radiochemistry and biology can now advance in their basic chemical knowledge just as they advanced as a result of the in-

vention of the microscope, except that now it is chemical vision which is magnified, and now can be seen not only what is present but how much and how it is composed.

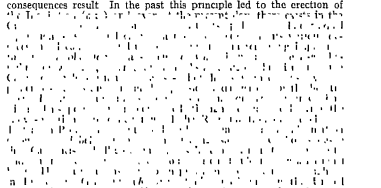
ULTRAMONTANISM, the name given to a certain school of opinion in the Roman Catholic Church (Lat. *ultra*, beyond, *montes*, the mountains). The expression *ultramontane* was originally no more than a term of locality, characterizing the persons so described as living—or derived from—"beyond the mountains"; but from the very beginning we find it used as a party appellation to describe those who looked "beyond the mountains" in order to obtain a lead from Rome, who represented the papal point of view and supported the papal policy. Thus, as early as the 11th century, the partisans of Gregory VII were styled ultramontanes, and from the 15th century onward the same name was given to the opponents of the Gallican movement in France.



It was not until the 19th century that "ultramontane" and "ultramontanism" came into general use as broad designations covering the characteristics of particular personalities, measures and phenomena within the Roman Catholic church At the present time they are applied to a tendency representing a definite form of Catholicism within that church; and this tendency, in spite of the individual forms it has assumed in different countries, everywhere displays the same essential features and pursues the same ends It follows, from the very nature of ultramontanism, and from the important position to which it has attained, that the official organs of the church and all the people interested in the continuance of the actual state of affairs deny that it exists at all as an independent tendency. It is indisputably legitimate to speak of ultramontanism as a distinct policy, but it is very difficult to define its essential character

(i) The first and fundamental characteristic of ultramontanism is its carrying to a logical issue the concentration of all ecclesiastical power in the person of the Roman Pontiff. (*See* PAPACY.) To the *curial system*, so evolved, continually fortifying its position in the domains of theology, ecclesiastical law, and politics, the *episcopal system* stands in opposition. The system admits that the pope represents the unity of the church, and acknowledges his primacy, while at the same time it claims on behalf of the bishops that, in virtue of the divine ordinance, they possess an inalienable right to a share in the government of the church (*see* CHURCH HISTORY; FEBRONIANISM). The struggle between these two systems continued well into the 19th century, and, though episcopalism was not infrequently proscribed by the Curia, it still survived, and until the year 1870 could boast that no ecumenical council had ventured to condemn it This was done for the first time, in 1870, at the Vatican council (*q v*), whose decrees, recognizing the universal episcopate and the infallibility of the pope, marked the triumph of that doctrine by which they had been long anticipated. The Catholic church, in all countries, has become more and more dependent on the Curia · the bishops have lost their autonomous standing, and their position is little more than that of papal delegates, while all important questions are referred to Rome or settled by the nuncios.

(ii) A second peculiarity of ultramontanism is that it claims for the Catholic church the functions of a political power, and asserts that it is the duty of the secular state to carry out its instructions and wishes. Since the conditions of the age no longer allow the pope to depose a temporal sovereign, the practical application of this conception of the relationship between the spiritual and temporal powers has taken other forms, all of which, however, clearly show that the superiority of the church over the state is assumed. This may be seen in the attitude of ultramontanism toward secular law. It assumes that God has conferred on the individual and on society certain rights and competences as inalienable possessions. This "natural law" ranks above all secular law, and all state legislation is binding only in so far as it is in harmony with that law. As to the provisions of this natural law, and the consequences they entail in individual cases, these can be decided only by the church, *i.e*, in the last resort, by the pope. Thus, even at the present time, the opinion is very clearly expressed in ultramontane quarters that, in the event of the state issuing laws contravening those of nature or of the church, obedience must be refused. The attitude of ultramontanism, for instance, toward the right claimed and exercised by the state to make laws concerning marriage is wholly negative, it recognizes no marriage laws except those of the church, the church alone being regarded as competent to decide what impediments are a bar to marriage, and to exercise jurisdiction over such cases.

(iii) Since ultramontanism cannot hope to realize its political ambitions unless it succeeds in controlling the intellectual and religious life of Catholic Christendom, it naturally attempts to extend its sphere of influence in all directions over culture, science, education, literature and the forms taken by devotion The development of these efforts may be easily traced from decisions of the congregation of the index and the holy office in Rome. Ultramontanism, too, labours systematically to bring the whole organization of education under ecclesiastical supervision and guidance.

(iv) In the fourth place, ultramontanism is the embodiment of that intolerance toward other creeds which is the logical consequence of the authoritarian claims of the Catholic church The general presuppositon involved is that a man cannot be saved except within the Catholic church. Since, however, on the one hand—in virtue of a theory advanced by Pius IX against the emperor William I of Germany, in a letter which has since become famous—every Christian, whether he will or no, belongs to that church by baptism, and is consequently pledged to obey her, and, on the other hand, since the state lies under the obligation to place the "secular arm" at its disposal whenever one of its members wishes to secede, the most far-reaching consequences result In the past this principle led to the erection of

Ultramontanism fears that any infusion of a national element into ecclesiastical life would entail the eventual separation of the people in question from papal control, and would lead to developments fraught with danger to the supremacy of the papacy

A MUCH DISPUTED PROBLEM

The relationship of ultramontanism to Catholicism is a much-disputed problem The ultramontane maintains that there is no justification for distinguishing between the two; but, even within the pale of the Roman church, the identification provokes dissent, and is repudiated by all who are shocked by the effects on the life of the church of an overcentralized political Catholicism. It was on these grounds that in Jan. 1904, it was proposed in the chamber of the Bavarian Reichsrath that the clergy should be deprived of the suffrage. The years between the Treaty of Frankfurt (1871) and the outbreak of World War I witnessed a growing difficulty on the part of Catholic Germans to reconcile ultramontane doctrine with the political and industrial development of united Germany. This was the real background of what is known as the *Kulturkampf* (*see* GERMANY, *History*).

The collapse of Germany after World War I (1914–18) tended, on the whole, to stimulate ultramontanism (*e.g*, in Bavaria); but the republican elements which combined in 1919 to uphold the constitution of Weimar, proved strong enough to resist the more extreme manifestations of this tendency.

It may be admitted that for all the principal contentions of ultramontanism, analogies may be found in the past history of the Catholic church Thus, in the middle ages, we find extremely bold pronouncements with respect to the position of the papacy in the universal church; while political Catholicism had its beginnings in antiquity and found very definite expression, for instance, in the bull *Unam sanctam* of Boniface VIII. Again, the attempt to subordinate all intellectual life to ecclesiastical control was a feature of the mediaeval church, and the fundamental attitude of that church toward heresy was fixed during the same period But since then much has been altered both in the church and her secular environment. The state has become independent of the church, legislates on its own sole authority, and has recognized as failing within its own proper sphere the civilizing agencies and social questions formerly reserved for the church Again, education, science, art and literature have been secularized; the printing press carries knowledge into every house, the number of illiterates diminishes from year to year in every civilized country, and the clergy are no longer the exclusive propagators of culture, but merely one factor among a hundred others.

The origin of modern ultramontanism is preceded and conditioned

by the collapse of Catholicism in the period of the French Revolution Pius VI and Pius VII were expelled from Rome, deprived of the papal states, and banished to France In that country the church almost completely lost her possessions, in Germany they were at least considerably curtalled; in both the hierarchical organization was shattered, while the Catholic laity surveyed the catastrophe in complete passivity. But from this severe fall the church recovered with comparative readiness, and the upward movement is contemporaneous with the rise of ultramontanism. The birth of that system, however, cannot be fixed as a definite event by the day and the hour, nor was it created by any single personality Rather it was the product of the first post-revolutionary generation Neither is it merely fortuitous that the reaction proceeded from France itself For in no other country had hostility to religion attained such a pitch or assumed such grotesque forms, and consequently in no other country did the yearning for religion manifest itself so unequivocally, when experience had demonstrated the necessity of a return to law and order. And in the other states of Europe there existed, more or less, a similar desire for peace and an equal dread of a fresh outbreak of revolutionary violence. In contrast to the struggle for an ideal freedom, which was at first hailed with tempestuous delight only to reveal itself as a dangerous tyranny, men became conscious of the need for a firmly established authority in the reconstruction of society. At the same time, the repression of idealism and sentiment during the period of "illumination" was amply revenged, and the barren age of reason gave place to Romanticism. These tendencies in contemporary opinion favoured the renovation of the Catholic church.

The papacy signalized its reinstation by restoring the Society of Jesus (1814) and re-establishing the index. In Germany ultramontanism had to contend with great difficulties; for here ecclesiastical affairs were not in so desperate a case that the most drastic remedies possessed the most powerful attraction, while, in addition, the clergy were unwilling to renounce all scientific work. The result was that a series of struggles took place between the old Catholicism and the new ultramontanism But even here ultramontanism gained ground and derived inestimable assistance from the blunders of government after government. The growth of Jesuitical influence at Rome—more especially after the return of Pius IX from exile—implied a more definite protection of ultramontanism by the papacy. The proclamation of the dogma of the Immaculate Conception in 1854 was more than the decision of an old and vexed theological problem, it was an act of conformity with a pietistic type especially represented by the Jesuits. The Syllabus of 1864, however, carried with it a recognition of the ultramontane condemnation of some aspects of modern culture (*see* the articles PIUS IX and SYLLABUS). Finally, in the Vatican council, the Jesuits saw another of their favourite theories —that of papal infallibility—elevated to the status of a dogma of the church (*see* VATICAN COUNCIL and INFALLIBILITY).

ULTRASONICS IN MEDICINE. The study of ultrasonic energy as a separate science began in the early 1920s, when high-frequency acoustic vibrations were first employed for underwater communication (this led to the development of Sonar, or sound navigation and ranging, during World War II). In the following decades, several thousand articles on various applications of ultrasonic energy were published, and many articles were written concerning the medical applications of ultrasonic energy.

Commonly these high-frequency sound waves or ultrasonic vibrations are produced by using a piezoelectric crystal. Certain crystals such as quartz will become electrically charged on opposite surfaces when they are subjected to mechanical pressure. This property is called the piezoelectric effect. The reverse effect also occurs, and the crystal will undergo mechanical vibration when opposite sides are subjected to an alternating electric field. It is comparatively easy to construct a piezoelectric transducer which converts electrical oscillations into mechanical vibrations which, in turn, produce sound waves. Such vibrations can be transmitted through a "sound head" to the surface of the body which is to be treated

The term ultrasonic (beyond sound) is self-defining. The acoustic spectrum is described as being divided into infrasonic, sonic and ultrasonic regions.

The terms ultrasonics and supersonics have been used interchangeably. Aeronautic engineers adopted the term supersonics to denote velocities greater than those of sound Medical investigators adopted the term ultrasonics to indicate frequencies higher than those audible to the human ear

Unlike electromagnetic waves, sound waves require a material medium for their propagation The mechanical forces accompanying pressure alternations and cavitations caused by ultrasonic energy play the major role in causing biologic effects. In addition to these mechanical effects are also thermal effects which are due largely to the absorption of the sound energy Ultrasonic energy also accelerates many chemical processes, particularly oxidative processes.

If one observes living cells under the microscope during ultrasonic irradiation, one may see such phenomena as whirling of the protoplasm, appendages being sheared off, filaments of spirogyra torn to pieces, laking of red blood corpuscles and paramecia rendered immobile and later torn open.

The mechanical and thermal effects of ultrasonic energy may cause either mechanical or thermal death of animals. The explosive violence with which cavitations occur may bring about the dissociation of molecules, and the heat produced by ultrasonic energy may reach levels which will destroy life.

When it is applied in large dosage, ultrasonic energy is a dangerous agent. Nevertheless, agents which are harmful in large doses may be of therapeutic and diagnostic value in smaller appropriate doses This proved to be the case with regard to ultrasonic energy.

Ultrasonotherapy is a term which indicates the use of ultrasonic energy in medical therapy, and medical scientists in the early 1950s were just beginning to investigate the therapeutic possibilities of this agent. Ultrasonoscopy, the employment of ultrasonic energy diagnostically, gave promise of proving valuable The employment of ultrasonic waves for detecting flaws in metals was well established by mid-century Similarly such detectors were being employed in medicine for disclosure of certain lesions in the human being A device to aid in medical diagnosis operates on the same principle as does the reflectoscope which sends pulsed ultrasonic waves into a medium and picks up their reflections from the opposite surface or from any irregularities that lie in their path. This principle was employed in medicine to detect the presence of gallstones and foreign bodies as well as in measuring the thickness of the intestinal wall, in detecting various abnormal growths and in measuring the size of the ventricles of the brain (sonography).

The bactericidal and viricidal effects of ultrasonic energy had been demonstrated Destruction of luminous bacteria by ultrasonic energy had been reported, and it had been shown that some bacteria are less resistant than others to the action of ultrasonic energy.

Early studies had been made on the employment of ultrasonic diathermy with the thought that it might produce valuable selective heating effects in various tissues of the human body Ultrasonic diathermy will heat bone cortex and bone marrow in living animals to higher levels of temperature than can be achieved by any other similar procedure. Also ultrasonic radiation will heat nerve tissue selectively, raising the temperature of nerves to higher levels than that of surrounding tissues. Although the employment of ultrasonic energy in diagnosis and in therapy would seem to have considerable promise, its exact sphere of usefulness had not yet been fully determined at midcentury, and it should be employed only in the hands of especially well-trained and highly qualified experts.

ULTRA-VIOLET RAY: *see* LIGHT AND RADIATION IN RELATION TO HEALTH.

ULUNDI (Zulu for "high place"), the royal kraal of Cetywayo, situated in the Mahlabatini district of Zululand, about 3 mi. N. of the White Umfolosi river, and 115 mi N.N E of Durban. The valley of the White Umfolosi there forms an extensive basin called the Emhlabatini, and from the time of Chaka to the overthrow of Cetywayo in 1883 was the exclusive place of residence of the Zulu kings. "The basin on the south side of the river is regarded as the cradle of the Zulu race; there all their

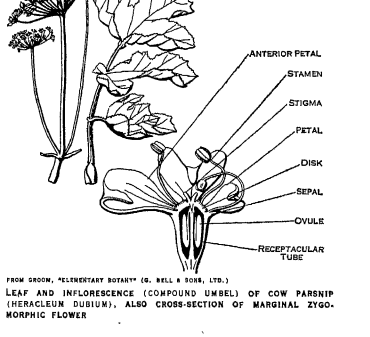
early chiefs are buried, hence the term Emakosini (*ie*, at the grave of the chiefs) applied to the district (*see* Blue Book C. 5143) During Cetywayo's reign a garrison of 3,000 was kept at Ulundi About a mile from the Kraal on July 4, 1879, a Zulu army about 20,000 strong was totally defeated by Lord Chelmsford The British loss was about 100, the Zulu 1,500 After the fight the royal kraal was burned. On Sept. 1, at the site of the kraal, Sir Garnet (afterward Lord) Wolseley announced the partition of Zululand into 13 petty chieftainships; but on Jan. 29, 1883, Cetywayo was reinstalled by the British at Ulundi as chief over two-thirds of his old dominions Attacked at Ulundi in July 1883 by the rival chief Usibepu, Cetywayo and his 5,000 followers fled to the Nkandhla bush The royal kraal was again destroyed and Ulundi ceased to be a rallying point The magistracy for the district is situated 5 mi N. of the site of Ulundi. (*See* ZULULAND)

ULVERSTON, market town, urban district, Lonsdale parliamentary division, Lancashire, England, in the Furness district, 8 mi NE. from Barrow-in-Furness, and 256 mi. from London by the London Midland Region railway. Pop. (est. 1938) 9,317. Area, 4.99 sq mi The church of St. Mary, founded in 1111, retains the original (Transitional) south door, but is mainly Perpendicular in style with an altar-tomb of 1588. Ulverston is second in importance to Barrow in the district. Conishead Priory, 2 mi SE, a mansion on the site of a priory founded in the reign of Henry II, is now a hydropathic establishment. Formerly Ulverston had a considerable trade in linens, checks and ginghams, but is now dependent on iron and steel works, chemical works, breweries, tanyards, and hardware, paper and wooden hoop factories. Through its connection with Morecambe bay by a ship canal, 1 mi. in length, it has a shipping trade in iron and slates

Ulverston, otherwise Vlureston, Olvestonum, occurs in Domesday book, where Vlurestun is named as a manor in possession of Turulf, who was probably the original Saxon owner. Early in the 12th century the manor passed to Stephen, count of Boulogne, who gave it to Furness abbey. In 1196 the abbot granted the vill of Ulverstone with the inhabitants to Gilbert Fitz-Reinfred, who granted it a charter and made it a free borough. The lordship became divided. One part passed to the Harringtons and finally to Henry Grey, duke of Suffolk, on whose attainder in 1553 it was forfeited to the crown; the other, returned to the abbey at the dissolution, was surrendered to the crown Early in the 17th century the crown alienated the manor, which descended to the family of Buccleuch. In 1280 Roger de Lancaster obtained a charter from Edward I for a weekly market on Thursday and an annual fair of three days on the eve of the Nativity (Sept. 7). The council now maintains the markets.

ULYSSES: *see* ODYSSEUS.

UMBALLA or AMBALA, a city and district of India, in East Punjab. The city is 3 mi E. of the river Ghaggar, 902 ft. above the sea. Pop. (1941) 44,964. It has a station on the North-Western railway, with a branch line to Kalka at the foot of the hills (39 mi), which was continued to Simla in 1903. Umballa has a large military cantonment which was first established in 1843. The cantonment, which lies 4 mi. S.E. of the native town, is well laid out with broad roads. Pop. (1941) 62,419.



The DISTRICT OF UMBALLA has an area of 1,851 sq.mi With one small exception it consists of a level alluvial plain, sloping away gradually from the foot of the Himalayas, and lying between the rivers Jumna and Sutlej. These rivers do not materially affect the district, which has a drainage system consisting of the numerous torrents which pour down from the hills The principal of the northern streams is the Ghaggar, into which the minor streams empty themselves, some within and some beyond the limits of the district. The Ghaggar is the only perennial stream within the district, but dwindles to a tiny rivulet in the dry season, and disappears altogether beyond the border of the district. In 1941 the population was 847,745. The principal crops are wheat, maize, pulse, millets, rice, cotton and some sugar cane. There are factories for ginning and pressing cotton, and also for grinding wheat. Two opposite corners of the district are watered by the Sirhind and the Western Jumna canals Umballa is one of the territories previously held by numerous Sikh sirdars, which were attacked by Ranjit Singh. This caused the movement of British troops in 1809 which resulted in the treaty with Ranjit Singh, by which he was required to withdraw his army from the left bank of the Sutlej. In June 1849, after the Second Sikh War had brought the Punjab under British rule, the chiefs were deprived of all sovereign power. In March 1869 a grand durbar was held at Umballa on the occasion of the visit of the amir Shere Ali

UMBEL, in botany, an inflorescence in which the stalks of the flowers all spring from the top of the main stalk, thus usually producing a flat-topped flower head, as in the carrot, parsnip and fennel (*See* FLOWER)

UMBELLIFERAE, a plant family of polypetalous dicotyledons belonging to the order Umbelliflorae, which includes also the families Araliaceae (ivy family) and Cornaceae (dogwood family). It contains 200 genera with about 2,700 species, occurring in all parts of the world but chiefly in north temperate regions. It is well represented in the British flora by 35 genera. The plants are annual or perennial herbs, rarely shrubby as sometimes in *Bupleurum*, with generally a very characteristic habit, namely stout erect stems with hollow internodes, alternate pinnately compound exstipulate sheathing leaves and compound umbels of small, generally white, flowers.

An example of an annual is the common fool's parsley, *Aethusa cynapium;* carrot (*Daucus carota*) is a biennial; others are perennial, persisting by means of tubers or rhizomes—such are hogweed (*Heracleum*), *Angelica*, *Peucedanum*, and others. Some genera have a creeping stem as in *Hydrocotyle* (pennywort), a small herb with a creeping filiform stem and, in the British species, entire leaves *Bupleurum* has simple, entire, often perfoliate leaves. *Azorella*, a large genus in south temperate regions, has a peculiar caespitose habit, forming dense cushions often several feet in diameter and persisting for many years; they resemble those of the Australian *Raoulia* (vegetable sheep) *Eryngium*, represented in Britain by sea holly (*E. maritimum*), is a large genus of rigid often glaucous herbs with spiny-toothed leaves, which in some South American species with narrow parallel-veined blade and broadly sheathing base recall those of a monocotyledon such as *Agave* or *Bromelia*. In sanicle (*Sanicula*), *Astrantia* and others the leaves are palmately divided.

There is also considerable variety in the development of the umbel, which is usually compound but sometimes simple, as generally in *Hydrocotyle* and *Astrantia*, rarely reduced to a single flower as in species of *Hydrocotyle*. In *Eryngium* the flowers are

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS, LTD.)

LEAF AND INFLORESCENCE (COMPOUND UMBEL) OF COW PARSNIP (HERACLEUM DUBIUM). ALSO CROSS-SECTION OF MARGINAL ZYGOMORPHIC FLOWER

crowded into dense heads subtended by a whorl of rigid bracts A terminal flower, distinguished by its form and dark colour, is sometimes present as in carrot (*Daucus*) The presence or absence of bracts and their form when present afford useful diagnostic characters. When present at the base of the primary rays of the umbel they form the involucre, and the involucel when at the base of a partial umbel In *Astrantia* the simple umbel is enveloped by a large, often coloured, involucre

The small epigynous flowers are usually hermaphrodite and regular, with parts in fives The sepals are usually very small, often represented only by teeth on the upper edge of the ovary; the petals are usually obovate or obcordate in shape, often with the tip inflexed; the stamens have long slender filaments bent inward in the bud but ultimately spreading; the two carpels are in the median plane; the two-celled ovary is surmounted by an epigynous glandular disk, which bears the two styles. Each ovary-cell contains a single pendulous anatropous ovule with a ventral raphe and a single integument. The flowers are rendered conspicuous by being massed into more or less dense flat-topped inflorescences (umbels) A resemblance to the rayed heads of Compositae is suggested in the frequently larger size of the flowers on the circumference of the umbel which are often sterile and zygomorphic from the larger size of the outer petals This arrangement allows a large number of flowers to be visited by insects in a short time. The flowers are generally white, sometimes pink or yellow, very rarely blue; they are generally scented, but the whole plant has an odour from the general presence in the tissues of an ethereal oil or resin The flower is widely open, the petals and stamens radiating from the central disk, on which honey is secreted, and is thus accessible to short-tongued flies Cross-pollination is necessary, the flowers being generally protandrous.

The fruit is very characteristic; a schizocarp which splits down the septum to form two dry one-seeded mericarps which are at first attached to, or pendulous from, an entire or split central axis or carpophore. The form of the mericarp affords valuable characters for distinguishing genera. On the outer surface of each are generally five ridges (primary ridges), between which are sometimes four secondary ridges; oil-cavities, vittae, are often present in the intervening furrows.

The family is classified according to the nature of the flower and fruit. Engler divides the family into three main classes, *Hydrocotyloideae, Saniculoideae, Apioideae;* the first two with two subfamilies each, the last with eight. The 35 British genera represent 7 of the 12 subfamilies The following may be mentioned: *Hydrocotyle* (pennywort), *Sanicula* (sanicle), *Conium* (hemlock, *q v*), *Smyrnium* (Alexanders), *Apium* (celery, *q v*), *Carum* (caraway, *q v*), *Myrrhis* (cicely), *Foeniculum* (fennel, *q.v.*), *Aethusa* (fool's parsley, *q v*), *Angelica* (*q v.*), *Pastinaca* (parsnip, *q v.*), *Heracleum* (hogweed), *Daucus* (carrot).

It is represented in North America by about 70 genera. The more common ones are *Sanicula* (black snakeroot), *Osmorrhiza* (sweet cicely), *Cicuta* (water hemlock), *Sium* (water parsnip), *Thaspium* (meadow parsnip), and *Angelica.*

UMBER: *see* MANGANESE; PAINTS, CHEMISTRY OF.

UMBRELLA BIRD, the name for a species of the genus *Cephalopterus*, belonging to the American family Cotingidae. The males are black and bear a peculiar umbrellalike crest from which characteristic the name is derived They also have long, plumed wattles depending from the throat.

UMBRIA (Ὀμβρική), the name of an ancient and a modern district of Italy.

1. The ancient district was bounded in the period of the Roman supremacy by the Ager Gallicus (in a line with Ravenna) on the north, by Etruria (the Tiber) on the west, by the Sabine territory on the south and by Picenum on the east. The Via Flaminia passed up through it from Ocriculum to Ariminum; along it lay the important towns of Narnia (Narni), Carsulae, Mevania (Bevagna), Forum Flaminii, Nuceria Camellaria (Nocera) and Forum Sempronii; and on the Adriatic coast Fanum Fortunae (Fano) and Pisaurum (Pesaro) . To the east lay Interamna (Terni), Spoletum (Spoleto), Fulginium (Foligno—on a branch of the Via Flaminia which left the main road at Narnia and rejoined it at Forum Flaminii) and the important town of Camerinum on the side of the Apennines toward Picenum On the side toward Etruria lay Ameria (Amelia) and Tuder (Todi), both on the direct road from Rome to Perusia, Iguvium, which occupied a very advantageous position close to the main pass through the Apennines, and Hispellum (Spello). Not far off was Asisium (Assisi), while far to the north in the mountains lay Sarsina. Under the empire it formed the sixth region of Italy.

The name Umbria is derived from the Umbri, one of the chief constituent stocks of the Italian nation. The origin and ethnic affinities of the Umbrians are still, like their geographical location in early times (1200–1000 B.C.), quite unknown (Randall MacIver, *Iron Age in Italy*, 140 [Oxford, 1927]), but their language proves them to have been an Aryan people closely allied with the Oscans and in a remoter degree with the Latins

The process by which the Umbrians were deprived of their traditional predominance in upper and central Italy and restricted to their confines of historic times cannot be traced in detail Their easternmost territory in the region of Ancona was perhaps wrested from them by the Picenes, a branch of the Sabine stock; and it is probable that they were partly displaced in the valley of the Po by the Gaulish tribes which began to pour across the Alps from about 500 B C Their chief enemies were undoubtedly the Etruscans (*q v.*), who eventually drove them into that upland tract athwart the Apennines to which the name of Umbria belonged in historical times without eradicating the Umbrian element of population in the conquered districts In Etruria proper the persistence of the Umbrian stock is indicated by the survival of numerous Umbrian placenames, and by the record of Umbrian soldiers taking part in Etruscan enterprises, *e g*, the attack on Cumae in 524 B C Indeed it is not unlikely that the bulk of the population in Etruria continued to be of Umbrian origin, and that the Romanization of this country was facilitated by the partial absorption of the Etruscan conquerors into the Umbrian multitude

Against the Romans the Umbrians never fought any wars of importance. After the downfall of the Etruscan power they made a belated attempt to aid their Samnite kinsmen in their decisive struggle against Rome (308 B.C.), but their communications with Samnium were impeded by the foundation of a Roman fortress at Narnia (298 B C), and at the great battle of Sentinum (295 B.C.), which was fought in their own territory, the Umbrians did not lend the Samnites any substantial help. It is perhaps on account of this defection that in 200 B.C they received from the Romans a portion of the Ager Gallicus reconquered from the Senonian Gauls. They offered no opposition to the construction of the Via Flaminia through the heart of their country, and in the Second Punic War withheld all assistance from Hannibal. In the Social War (90–89 B.C.), they joined the rebels tardily and were among the first to make their peace with Rome. Henceforth they no longer played an independent part in Italian history.

The material prosperity of Umbria, in spite of its unfavourable position for commercial intercourse, was relatively great, owing to the fertility of the numerous small valleys which intersect the Apennine system in this region. The chief products of the soil were olives, vines and spelt; the uplands harboured the choicest boars of Italy The abundance of inscriptions and the high proportion of recruits furnished to the army attest its continued populousness. Among its most famous natives were the poets Plautus (b. at Sarsina) and Propertius (b at Assisi).

The Umbrians in addition to the city (*tota*) had a larger territorial division in the *tribus* (*trifu*, acc.) as is gathered from Livy (xxxi, 2, "per Umbriam quam tribum Sapinium vocant"; *cf.* xxxii, 37) and from the Eugubine Tables ("trifor Tarsinates," vi, B, 54). Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits There is conclusive proof of strong Etruscan influences in Umbria, and their alphabet is undoubtedly of

Chalcid-Etruscan origin, while the language, which is known from one or two inscriptions from Fulginium and Tuder, and from the so-called *Iguvine Tables*, the earliest parts of which may go back to the 5th cent. B.C. (*see* IGUVIUM), is a dialect which sprang from the Oscan, but is marked by some phonetic changes. Etruria also taught the towns near it (*e.g.*, Tuder and Iguvium) the art of minting, for they alone had a coinage. The Umbrians counted their day from noon to noon But whether they borrowed this likewise from the Etruscans is not known. In their measuring of land they employed the *versus*, a measure common to them and the Oscans, 35 of which went to the Roman *jugerum*

2. The modern territorial division is situated in the middle of the peninsula, between Tuscany and the Marches on the north and east, and Lazio (Latium) and the Abruzzi on the south and west, and comprising the two provinces of Perugia and Terni, with an area of 3,281 sq mi.; pop. (1936), 725,918. Umbria and the provinces of Ancona and Pesaro and Urbino taken together form an area slightly more extensive than that of the sixth region of Augustus The surface is mountainous, but affords good pasture, and there are numerous fertile valleys Many treasures of art and architecture are preserved, and Umbria is in this respect one of the most interesting regions of Italy. (*See* PERUGIA.) Modern Umbria formed down to 1860 a part of the states of the church.

Three main lines of railway run through the territory. One from Florence to Rome skirts the borders of the province on the west, running north and south. Another Rome-Florence line bisects the territory north and south, while the Rome-Ancona runs across the province from northeast to southwest. The cross communication is given by three branch lines. In the north a narrow gauge line from Arezzo to Fossato passes through Gubbio. Perugia, the capital of the province, stands on the line from Terontola to Foligno, while on the extreme south a line passing through Rieti and Aquila, and ultimately reaching Sulmona, starts from Terni on the Rome-Ancona line There is also an electric railway from Terni via Perugia to Umbertide, on the line between Arezzo and Fossato.

The great steelworks of Terni (*q.v.*), the chloride factory at Nera Montoro near Narni, the chemical manure works at Narni, Foligno and Assisi, the wool and jute works of Terni and Foligno, the cotton spinnery of Spoleto may all be mentioned, while the hydroelectric plants of Umbria, which are concentrated at Terni, are of great importance, and are able to help those of Lazio and Tuscany. (T. A.)

UMBRIAN LANGUAGE. The dialect in which the *Iguvine Tables* (*see* IGUVIUM) are written is usually known as Umbrian, as it is the only monument we possess of any length of the tongue spoken in the Umbrian district before it was Latinized. The language is that of a certain limited area, which cannot yet be shown to have extended very far beyond the eastern half of the Tiber valley (from Interamna Nahartium to Urvinum Mataurense).

Umbrian has diverged from Oscan in the following matters:

(1) The palatalization of *k* and *g* before a following *i* or *e*, or consonant *i* as in *tiçit* (i.e., *dçit*)=Lat. *decet*; *muieta* past part. passive (pronounced as though the *i* were an English or French *j*) beside Umb. imperative *mugatu*, Lat. *mugire*.

(2) The loss of final *-d*, *e.g.*, in the abl. sing. fem. Umb. *tôtā*=Osc. *toutād*

(3) The change of *d* between vowels to a sound akin to *r*, written by a special symbol ♀ (*d*) in Umbrian alphabet and by RS in Latin alphabet, e.g., *teŋa*, in Umbrian alphabet=*dursa* in Latin alphabet, "let him give," exactly equivalent to Paelignian *dida*.

(4) The change of *-s-* to *-r-* between vowels as in *erom*, "esse"=Osc *esum*, and the gen. plur. fem. ending in *-arum*=Lat. *-arum*, Osc. *-asum*.

To this there are exceptions, *e.g.*, *asa*=Lat *ara*, which are generally regarded as mere archaisms. Unfortunately the majority of them are in words of whose origin and meaning very little is known, so that (for all we can tell) in many the *-s-* may represent *-ss-* or *-ps-* as in *osatu*=Lat *operato*, *cf* Osc. *opsaom*

(5) The change of final *-ns* to *-f* as in the acc. plur. masc. *vitluf*=Lat. *vitulōs*.

(6) In the latest stage of the dialect the change of final *-s* to *-r*, as in abl plur. *arver*, *arvis*, *ie*, "arvorum frugibus."

(7) The decay of all diphthongs.

(8) The change of initial *f* to *v*, as in *vutu*=Lat *lavito*

Save for the consequences of these phonetic changes. Umbrian morphology and syntax exhibit no divergence from Oscan that need be mentioned here, save perhaps two peculiar perfect-formations with *-l-* and *-ŋçi-*; as in *ampeitust*, fut perf. "impenderit," *combifiançiust*, "nuntiaverit" (or the like).

UNAMUNO, MIGUEL DE (1864–1936), Spanish scholar and man of letters, was born at Bilbao on Sept 29, 1864. He was educated in Madrid, receiving a doctor's degree in philosophy and letters, and in 1892 was appointed to the chair of Greek language and literature at Salamanca university In 1900 he became rector of the university. He was always vitally interested in practical affairs and later in a campaign by means of newspaper articles and addresses against governmental corruption and abuses he was so outspoken that he was removed from the rectorship of the university. The coup d'état of Primo de Rivera in 1923, which established a military directorate, aroused him to such vehement denunciation that in Feb. 1924, he was exiled to one of the more remote of the Canary Islands. The sentence aroused much criticism and the government granted amnesty in July, 1924, but Unamuno refused to return to Spain and took up his residence in Paris. In letters Unamuno was a man of wide culture and of great influence in Spanish-speaking countries In his poems there is vigorous thought and lofty passion which strains at the bonds of rhyme, while his blank verse is weighted with mysticism There are many excellent sonnets in the collection *Rosario de Sonetos líricos* (1911). His most remarkable poem was *El Cristo de Velasques* (1920), a long series of mystic meditations, which is often compared by critics to the work of William Blake His novels are made impressive by their philosophical quality. Superfluous details and descriptive writing are suppressed and the stage is stripped for the interaction of passions and ideas *Niebla* (1914), *Abel Sanchez* (1917), *La Tia Tula* (1921) and *Tres Novelas Ejemplares* (1921) are all important, but his masterpiece is generally acceded to be *Del Sentimiento Tragico de la Vida* (1913; trans into English, 1921). Much of his thought, as well as more colourful descriptive writing, is to be found in the *Ensayos* (7 vol., 1916–19), while warmth of feeling for the people and countryside of Spain is shown in *De mi país* (1903); *Por tierras de Portugal y de España* (1911) and *Andanzas y Visiones* (1922). In the *Vida de Don Quijote y Sancho* (1914; trans. into Eng 1927) he preached the cult of quixotism as an ideal.

A number of selections and extracts from his essays are translated in *Essays and Soliloquies* (1925); other translations are *The Agony of Christianity* (1928) and the novel *Mist* (1929).

UNAO, a town and district of India, in the Lucknow division of the United Provinces. The town is 10 mi N.E. of Cawnpore. Pop. (1941), 20,107.

The DISTRICT OF UNAO has an area of 1,762 sq.mi. It consists of a flat alluvial plain, lying north of the Ganges. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar*, the whole being intersected by small streams used for irrigation. The Ganges is the only navigable river in the district, while the Sai forms its northeastern boundary. Pop. (1941) 959,542.

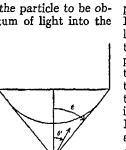
UNCERTAINTY PRINCIPLE, THE. This principle, which was formulated by Werner Heisenberg (in 1927), and which plays a fundamental role in quantum mechanics (*q.v.*) states that it is impossible to specify or determine simultaneously both the position and velocity of a particle as accurately as is wished. It is, to be sure, possible to fix either of these quantities as precisely as desired, but only at a price, for the greater the precision in one, the greater the inevitable lack of definiteness in the other. A

more exact formulation is as follows: there is no way in which quantum-mechanical language permits us to say that a co-ordinate x and its conjugate momentum p_x simultaneously have values x' and p'_x with arbitrarily small uncertainty. Instead, if Δx and Δp_x denote the uncertainty in x and p_x respectively, there exists the inequality

$$\Delta x \Delta p_x \geqq \frac{h}{4\pi} \qquad (1)$$

where h is Planck's constant 6.62×10^{-27} ergs $\times$ sec. It is to be emphasized that the restrictions imposed by the uncertainty principle apply only to a pair of dynamical variables which are canonically conjugate There is no limit in principle to the precision with which values can be assigned to a co-ordinate and a momentum conjugate to another independent co-ordinate, as, for example, the x component of position and the y component of momentum.

Because h is so small, the indeterminism caused by the uncertainty principle is of no consequence in ordinary experience. For instance, the resulting error in the position or velocity of a rifle bullet would be completely inconsequential even for the most refined ballistic calculation On the other hand, the Heisenberg uncertainty principle is of great interest and importance in the interpretation of atomic experiments, and has startling philosophical implications



For discussion of the place of the uncertainty principle in the general scheme of things in quantum mechanics *see* QUANTUM MECHANICS: *Statistical Significance*. A quantitative definition is given there of the uncertainty in terms of root mean square deviation, as well as an outline of how the uncertainty principle is derived from the basic equations of wave mechanics, of which it is a necessary consequence.

A standard illustration of the uncertainty principle is furnished by the resolving power of a microscope, which shall be taken as an example.

Let the particle be at such a distance that the cone of rays scattered by the particle and entering the lens of the microscope have an angular opening ϵ, as shown in the figure. It is shown in optics that the resolving power of the instrument is

$$\Delta x = \frac{\lambda}{\sin \epsilon} \qquad (2)$$

where λ is the wave length. In order for the particle to be observed it must scatter at least one quantum of light into the microscope. (If more than one quantum is scattered, the particle will receive extra recoil kicks, and the uncertainty will be even greater than with the estimate.) The theory of the Compton Effect (*q.v.*) and related subjects shows that a light quantum of frequency ν is endowed with a momentum $h\nu/c$, where c is the velocity of light. Consider for simplicity the case where the initial and scattered quanta fall in the same plane as the axis of the microscope, and make angles θ, θ' with the latter, as shown in the figure. Since momentum is conserved in the interaction between the particle and the light quantum, the x component of momentum imparted to the particle is $(\sin\theta - \sin\theta')\frac{h\nu}{c}$ (Here the Compton change of frequency on scattering has been neglected, but this is a second order effect.) As θ' is comprised within the limits $\pm\epsilon$ in order to enter the microscope, the x component of momentum imparted to the particle may be anywhere between

$$(\sin\theta - \sin\epsilon)\frac{h\nu}{c} \text{ and } (\sin\theta + \sin\epsilon)\frac{h\nu}{c}$$

Hence the observation inherently introduces an uncertainty in the momentum of the particle amounting to $\Delta p_x = 2 \sin\epsilon \cdot \frac{h\nu}{c}$. Combining this result with (1) and remembering that $\lambda = \frac{c}{\nu}$, it is seen that $\Delta p_x \Delta x = 2h$. The fact that ϵ does not appear in this result illustrates the futility of trying to defeat the uncertainty principle with any choice of aperture.

Too much significance should not be attached to the fact that the error is apparently 8π times the minimum allowed by (1), for the estimate (2) of resolving power is accurate only to order of magnitude

In classical mechanics, if the initial position and velocity are known, together with the forces acting, then a particle's path can be computed for all future time On the other hand, the uncertainty principle prevents specification of the initial conditions in quantum mechanics, and as a result the future of a particle cannot be definitely predicted. Because of this the law of cause and effect ceases to apply, though the ambiguity is, of course, important only on the atomic scale Instead the future of a particle can only be statistically predicted in quantum mechanics, but the type of information supplied is just that needed to describe actual experiments. For instance, in the theory of the scattering of alpha particles, quantum mechanics gives directly the formula for the distribution-in-angle of the scattered particles, without correlating a particular scattering angle with a particular distance of closest approach to a scattering centre. Such a correlation is involved in classical theory, but it is necessary to integrate over all distances of approach, and the latter are supernumerary quantities not capable of being observed in the experiment; hence it is unimportant that they are uncertain in the quantum-mechanical interpretation. In fact, it must be regarded as an element of strength in quantum mechanics that the statistics governing the distribution of distances of approach is self-contained in the formalism, and not introduced as an additional hypothesis as in the classical treatment

It is to be emphasized that in making observations on a system, it is necessary to exchange energy and momentum with it This exchange of necessity spoils the original properties of the system. The resulting lack of precision with which these properties can be measured is the crux of the uncertainty principle. In the microscope example, for instance, the momentum of the particle was rendered uncertain by the impact with the light quantum by which it was being observed.

The fact that there are intrinsic limits to the precision of experimentation obviously has profound philosophical significance. In particular, metaphysicians can argue whether nature inherently lacks determinism, or is instead completely deterministic With the latter view, the ambiguity involved in the uncertainty principle, or the apparent breakdown of the law of cause and effect is to be considered as arising only by virtue of the "spoiling" by the experimentation. It is in a certain sense a meaningless question which view is correct, as the properties of nature that are inherently incapable of observation have no realistic significance. In this connection it is well to quote a few sentences from an article by P. W. Bridgman in *Harper's Magazine*, vol. 158, pp. 443–451 (1929):

> The immediate effect [of the uncertainty principle] will be to let loose a veritable intellectual spree of licentious and debauched thinking. This will come from the refusal to take at its true value the statement that it is meaningless to penetrate much deeper than the electron, and will have the thesis that there *is really* a domain beyond, only that man with his present limitations is not fitted to enter this domain. . . . The existence of such a domain will be made the basis of an orgy of rationalizing. It will be made the substance of the soul . . . the principle of vital processes will have its seat here; and it will be the medium of telepathic communication. One group will find in the failure of the physical law of cause and effect the solution of the age-old problem of the freedom of the will, and, on the other hand, the aetheist will find the justification of his contention that chance rules the universe.

The safest conclusion is perhaps that man should remain humble in the face of nature since there are inherent limitations to the precision with which he can observe the latter.

See W. Heisenberg, *The Physical Principles of the Quantum Theory* (1930) The uncertainty principle was first formulated by Heisenberg in the *Zeitschrift fur Physik*, vol. 43, pp. 172–198 (1927), and somewhat amplified by Niels Bohr in *Nature*, vol. 121, p. 580 (1928). An interesting popular article on the philosophical implications of the

uncertainty principle is that by P. W. Bridgman in *Harper's Magazine*, vol 158, pp. 443–451 (1929) (J. H. V.)

UNCLE SAM, the popular name for the United States. The origin of the name is unknown, but is attributed to the initials U.S., placed on property of the government. It came into existence about the time of the outbreak of the War of 1812, spread rapidly, and within a few years was recognized universally.

UNCONSCIOUS. Sigmund Freud, about 1885, began an era of thought by stating that ideas, feelings and memories outside consciousness may affect a person's behaviour even though he cannot report upon them. William James called this the most important step forward in the time he had been studying psychology.

Just as the activities of all units of an army are not always integrated, so all aspects of the mental processes and behaviour of an individual are not co-ordinated. Some mental systems which affect behaviour unconsciously are independent of and unrecognized by the controlling part of the personality.

Disparate and sometimes conflicting uses of "unconscious" occur in popular and scientific writings. The word has been used synonymously with "inanimate" or "subhuman" to describe whatever is incapable of discriminating or behaving. Individuals have been termed unconscious under many different circumstances —when unresponsive to stimulation because of absentmindedness, day-dreaming, hypnosis, sleep, anaesthesia, etc; when not discriminating between different stimuli; when acting sheerly on the basis of conditioned responses (*see* below); when not sensing, because one or more factors are preventing adequate stimuli from affecting their nervous systems. A person may also be called unconscious if he is not attending to something, if he lacks insight into the nature of a situation involving him, if he forgets something; if his actions are purely instinctive; if he does not recognize the character of the determinants of his behaviour; if some of his acts are involuntary; if he cannot communicate all he is aware of, by word, gesture, facial expression or other means; if he deliberately ignores facts he knows; or if he makes discriminations but is unaware that he does.

The actions, ideas, emotions, needs or drives of a person are also often called unconscious in many of the above meanings, as well as in another sense—not mental. Various theoretical schools deny that unconscious processes exist, on the grounds that consciousness and mind are equivalent, that what is unconscious is therefore not mental, and that hence the concept of unconscious mental processes is self-contradictory. Freud contended that this apparent paradox arises from misunderstanding the psychoanalytic use of "unconscious," which refers to processes that (1) are dynamically repressed away from awareness, the organ of perception; (2) can be brought to awareness only by special techniques like hypnosis and psychoanalysis; and (3) are not controllable voluntarily.

The numerous uses of the word "unconscious" reflect great theoretical disagreements, and sometimes the same process is conscious in one sense and unconscious in another. For example, after a bell has been sounded routinely one minute before repeated feedings, the salivation that normally occurs upon presentation of food can eventually be elicited by the bell—a conditioned response. Psychologists who do not accept introspective reports as valid consider that behaviour indicating discrimination between the presence and absence of a stimulus is evidence of consciousness. Hence a conditioned response is such evidence—a sign, in the example, of consciousness of the bell. Other psychologists do not agree that mental processes are merely neural function evidenced by discriminatory behaviour, believing they also involve awareness of this discrimination. Some of the latter group hold that this consciousness is associated with every mental process, and since conditioned responses are often given a purely neurophysiological explanation, they are not mental—unconscious.

Various schools explain how it is determined which mental processes are conscious and which unconscious by using one or both of two concepts—the economy principle and the pleasure principle. The economy principle is that ordinarily one, or at most a few, thoughts or acts are attended to at a time. The organism appears to function most efficiently when it does not dissipate the energy of attention but concentrates this consciousness on a restricted range of activities, allowing the rest to be relatively or completely automatic. Moreover, certain activities, including composing, complex judgments and highly practised muscular acts, are often accomplished best automatically. If unattended processes develop unusual characteristics or threats to the organism's welfare, a guarding mechanism swiftly turns attentive consciousness to them. Along with this change appear expressions indicating surprise, characteristic objective signs of the onset of the new state of consciousness. Presumably this is associated with increasing "neural vigilance," a phrase of Henry Head meaning high-grade physiological efficiency in a part of the nervous system, which he postulated as developing as consciousness turns to the functions of that part.

Subjectively, various levels of unconsciousness merge imperceptibly into one another. The ordinary waking state differs from hypnosis which differs from sleep which differs from deep anaesthesia. Functional levels of the nervous system also exist, each with its own threshold. Stimuli may be strong enough to cross the threshold to one level and affect behaviour, without being capable of reaching the level of highest neural vigilance. Thus, behaviour may be affected and awareness not be. There is a range of intensity of stimulation at which perception and learning occur without awareness.

Freud described how the pleasure principle operates, thrusting painful thoughts and desires into unconsciousness and permitting pleasant ones to remain conscious. He considered painful those which produce shame, guilt or injury to self-esteem. These are repressed into unconsciousness, which psychoanalytic theory sharply delimits from consciousness, recognizing little merging. They are censored and kept from consciousness unless altered into dream symbols, slips of the tongue, jests or some other acceptable guise.

Because dreams seem distorted and for other reasons, unconscious processes are frequently called irrational. Clinical evidence indicates that one class of these is not illogical but shrewdly devoted to fulfilling socially unacceptable, anarchic desires for independence and self-centred pleasure. Other classes are not irrational either, but are determined by subthreshold stimulation, unconscious conditioning or forgotten events. They elicit unaccountable behaviour because they are not available to awareness. Society forces us to explain our acts, so we make them appear to ourselves and our fellows to arise logically from accepted principles of our culture. That this mechanism is called rationalization does not mean unconscious processes are irrational.

(Ja. G. M.)

UNDERGROUND RAILROAD, a term used popularly to designate an organized system existing in the northern states of the United States prior to the Civil War by which slaves were secretly helped by sympathetic northerners and in defiance of the Fugitive Slave laws (*q.v.*), to make their way to Canada, and thus to freedom. The name arose from the exaggerated use of railway terms in reference to the conduct of the system. Levi Coffin and Robert Purvis were the "presidents" of the road. Various routes were known as "lines," stopping places were called "stations," those who aided along the stages of the route were "conductors" and their charges were referred to as "packages" or "freight." The system reached from Kentucky and Virginia across Ohio, and from Maryland across Pennsylvania and New York or New England. The Quakers of Pennsylvania perhaps initiated the system; the best known of them, Thomas Garrett (1789–1871), is said to have helped 2,700 slaves to freedom. One of the most picturesque conductors was Harriet Tubman, a Negro woman called "General" Tubman by John Brown, and "Moses" by her fellow Negroes, who made about a score of trips into the south, bringing out with her perhaps 300 Negroes altogether. Levi Coffin, a native of North Carolina, in 1826 settled at New Garden (now Fountain City), Ohio, where his home was the meeting point of three "lines" from Kentucky. In 1847 he removed to Cincinnati, where he was even more successful in bringing out

slaves. Estimates of the number of slaves who reached freedom through the system vary from 40,000 to 100,000.

See W. H Siebert, *The Underground Railroad* (1898), a scholarly study containing maps of routes and bibliography W. Still, *The Underground Railroad* (1872), R C Smedley, *History of the Underground Railroad* (1883), and *Reminiscences of Levi Coffin* (1880) are personal records of participants

UNDERWOOD, FRANCIS HENRY (1825–1894), U.S. author, was born in Enfield, Mass , on Jan 12, 1825 He attended Amherst college for a year and then went to Kentucky to study law and teach. He was admitted to the bar in 1847 An original antipathy to slavery was heightened by close observation and hastened his return to Massachusetts in 1850

After a year of law practice he was appointed clerk of the state senate and two years later became a literary editor for the Boston publishing house of Phillips, Sampson and company The idea came to him at about this time of starting a magazine in New England, similar to *Harper's* in New York, in which the Free Soil movement could find a voice. He was peculiarly fitted for the task, combining in himself both practical connections in the publishing trade and wide personal associations among the most distinguished writers of his day—Emerson, Lowell, Holmes, Longfellow, Charles Eliot Norton and Whittier. He entered into correspondence with these and other men, securing manuscripts and promises of material, and by 1853 had contracted for publication with J P. Jewett and company, publishers of *Uncle Tom's Cabin.*

Unfortunately the firm failed before a beginning could be made, and Underwood turned doubtfully to Phillips, Sampson and company, who had once turned down Harriet Stowe's novel for fear of alienating its southern trade Chiefly through the influence of Mrs Stowe, they were finally persuaded to publish the *Atlantic Monthly,* so named by Holmes, and the first number was issued in Nov. 1857 with Lowell as editor

Underwood, assistant to the editor, was responsible for sifting all copy for undesirable material. Two years later the *Atlantic,* already a success, was taken over by Ticknor and Fields, and there Underwood's association with the magazine ended. Recalling early plans of its makers, he wrote in 1882 "The *Atlantic Monthly* was started with the definite purpose of concentrating the efforts of the best writers upon literature and politics under the light of the highest morals." In 1859 he became clerk of the superior criminal court of Boston, which position he left after seven years to engage in private enterprise. He was twice appointed U.S. consul in Scotland by President Grover Cleveland; in 1866 to Glasgow, and in 1893 to Leith. He wrote a number of books, the best known of which was *Quabbin, the Story of a Small Town* (1893). It is a novel based on life in his own home town of Enfield and was written in Glasgow. His biographies of Longfellow, Lowell and Whittier are notable for their personal recollections. *Cloud-Pictures,* a collection of short stories, appeared in 1872. Other books include a *Hand-Book of English Literature* (1871) and a *Hand-Book of American Literature* (1872).

He died in Edinburgh on Aug. 7, 1894.

UNDERWOOD, OSCAR WILDER (1862–1929), U.S. politician, was born at Louisville, Ky, on May 6, 1862. He studied at the University of Virginia (1881–84), was admitted to the bar in 1884, and practised law thereafter in Birmingham, Ala. From 1895 to 1915 he was a member from Alabama of the national house of representatives, and during his last two years chairman of the committee on ways and means. After the Democrats came into power in 1913 he had a large share in framing the tariff bill passed the same year. In 1914 he opposed the Panama Canal Tolls Repeal bill, but supported the resolution authorizing the president to use armed force in Mexico. He was opposed to the woman suffrage amendment to the federal constitution, holding that the question was a state issue. He also opposed the national prohibition amendment. In 1914 he was elected to the U.S. senate, and in 1920 re-elected. In 1919 he favoured the antistrike clause of the Cummins railway bill. A strong supporter of the peace treaty of Versailles, in Dec. 1919 he offered a resolution in the senate providing that the president of the senate should appoint a committee of ten senators to work out some acceptable plan for adopting the peace treaty; but this was blocked by Senator Lodge. In April 1920 he was chosen Democratic leader in the senate He was a U.S. delegate at the Washington Conference on the Limitation of Armaments which assembled in Nov. 1921. At the Democratic national convention held in New York city, June 1924, Senator Underwood was an unsuccessful candidate for the presidential nomination. In 1927 he was made a member of the American delegation to the Pan-American congress He published *Changing Sands of Party Politics* (1927). He died at Woodlawn, Va , on Jan. 25, 1929.

UNDERWRITING: *see* INSURANCE, ARTICLES ON

UNDSET, SIGRID (1882–1949), Norwegian author, was born at Kalundborg, Denmark, on May 20, 1882. After completing her studies at the Christiania Mercantile college, Mme Undset entered a city office in 1899 and remained a clerk until 1909 She thus gained an intimate acquaintance with the empty and unenlivened existence of the girls with whom she came into contact, and used her experience in her first literary works, initiated in 1907 by *Fru Marta Oulie* In 1912 she achieved fame by the great Christiania novel, *Jenny* (Eng. trans , 1920), remarkable for its courageous treatment of the erotic problem. After revealing in one of her minor works (1919) the religious crisis in her mind which in 1925 caused her to join the Roman Catholic Church, Mme. Undset published *Kristin Lavransdatter* (1920–22), Eng. trans., part I *The Bridal Wreath* (1923), part II *The Mistress of Husaby* (1925), part III *The Cross* (1930), a remarkable novel of the 14th century. Mme. Undset's work shows psychological depth and an ability to appraise the mind and temper of bygone ages Her work *Olav Audunsson,* a novel of the 13th century (1925), Eng trans., *The Axe* (1928), has the same qualities. Other works are *In the Wilderness* (1929); *The Burning Bush* (1932); *The Faithful Wife* (1937); and *Men, Women, and Places,* an autobiography (1939). She was awarded the Nobel prize in 1928. She died at Lillehammer, Norway, June 10, 1949

See J Bing, *Sigrid Undset* (1924).

UNDULANT FEVER: *see* BRUCELLOSIS.

UNEARNED INCREMENT, in economics, a term frequently applied to that part of the value of land which is due to the growth and development of the community using it, to the construction of buildings, roads, railways, canals, docks, harbours, upon it, or to the working of minerals beneath it Thus a piece of land in one part of a country, although beautiful or fertile, may be worth very little, while in another part of the same country a piece of land of similar area required for a railway, or by a railway made accessible for residential purposes, may rise in value by a hundredfold or a thousandfold. The gains thus made by some landowners are so obvious and so great that the specific taxation of the unearned increment has been often proposed and in some countries carried into effect (*see* article on LAND TAXES). Among others, John Stuart Mill favoured a progressive tax on land Henry George's tax amounted to a proposal to absorb the whole of the surplus value (*see* SINGLE TAX).

UNEMPLOYMENT. Although the rough meaning of the term unemployment requires no explanation, there are some complications in trying to define it precisely. If we think of unemployment as being the difference between full employment and actual employment then the difficulties must arise in connection with either or both of these terms. Obviously there are some problems in any attempt at measuring actual employment; there are always borderline cases such as part-time or intermittent workers. But these problems are not nearly so great as those connected with full employment.

Concepts of Full and Actual Employment.—In defining full employment we can start from the elementary proposition that it is not a concept applying to the total population of a country. Plainly there are a large number in any community who do not seek paid work under any circumstances. Many people are unable to enter the labour market. This may be because of physical or mental disabilities (*e.g.,* cripples) or legal regulations (children) or social conventions (unmarried daughters of rich families) or, most important of all, preoccupation with unpaid duties (housewives). Often there is overlapping between these

categories (*e.g.*, housewives also come under social convention), but the classification nevertheless is useful. On the other hand, there are always some people who are unwilling to work—the idle rich and the vagrants, ne'er-do-wells and misfits of society.

In some cases, both these points—inability and unwillingness—apply Thus, as a first approximation full employment can have no meaning in relation to that section of society which under no circumstances is able or willing to work.

Nor would it be true to say that full employment exists when all those who are willing and able to work can find work. Obviously this is impossible, for the number among those potentially able and willing to work who are actually in the labour market at any one time will depend on a number of factors but principally on the reward for working or, more simply, the wages offered Therefore, full employment can be considered to exist when individuals actually work as much as they are willing to work at any given reward for working; and as a corollary there are a number of "levels" of full employment depending on the reward currently offered and possibly a number of levels for the same reward in different years. It is, in fact, impossible to be much more precise about the notion of full employment and of the many attempts which have been made to define it more accurately none can be reckoned as successful. A fundamental difficulty is that at any one time the number seeking work at the ruling wage rate may not be known, nor that of persons seeking work at any other wage rate.

Thus, to take a simple example, if there is a sudden rise in wage rates (unaccompanied by a parallel price rise) will the number prepared to work rise or fall? For higher returns more people may be willing to work; but others, if their wants in life are simple and easily satisfied, may prefer to work less.

Other difficulties, and this is where the problem of actual employment appears, are to be found in the concept of "work" For it is not simply a question of employment or nonemployment but also one of partial employment. The question arises of how to treat workers who are unable to secure more than a few hours' work a week, or those who are willing to work only a few hours a week. This naturally leads to another problem: in what category are to be placed those whose work is, in some sense or other, of less than normal productivity? This is an extremely important point in practice because the number of street singers, back-garden vegetable growers, etc., always increases tremendously during a depression. If these people are regarded as actually being in employment or are excluded from the labour force deemed to be seeking employment, any estimates of unemployment will be grossly too low. This point was of particular importance in the U S. in the 1930s when the amount of low-productive family labour on farms increased considerably. To put the issue in another way, unemployment must also include underemployment. Another point, too, must be noticed. To speak in terms of the labour force seeking employment and wages paid implies that unemployment is a phenomenon concerning the wage-earning classes only and, in fact, this is the problem with which most economic analysis is concerned and the measure which statisticians try to establish. This means that unemployment is essentially a phenomenon of economies organized on a capitalist basis; where there is no wage-earning class there can be no unemployment, in the technical sense. Nor could it exist if all labour were centrally directed to jobs. It should be noted that unemployment is not large in primitive agricultural countries like India because there is only a small wage-earning community and if this is thrown out of employment it can always obtain low-productive work on the land.

Some of these difficulties (*e.g.*, the treatment of those willing to work only intermittently) affect both the concept of full employment and the measure of actual employment in the same way and therefore can be ignored in so far as unemployment is concerned, being the difference between the two. This is not the case for most of them, however, and it is therefore impossible to give any single, precise definition of unemployment. But because it is a matter which is of extreme practical importance and has necessitated a good deal of legislation, certain conventional rules for measuring unemployment have been established which should be considered

STATISTICS OF UNEMPLOYMENT
